"Every man is entitled to labor and to get for his labor the highest compensation he can lawfully secure. There is no law to compel him to labor unless he chooses, and he may cease to labor whenever he considers it to be to his interest so to cease. The laboring man, out of whose efforts wealth arises, has the sympathy of all disinterested people in his lawful struggles to secure a larger proportion of the profit which results from his labor. What he earns belongs to him, and if he invests his earnings the law protects his property just as the rights of property of all men must be protected. He has no right to interfere with another man who may want to labor. Violence has no place among us and will not be tolerated. Let all men in quiet and soberness keep the peace and attend to their affairs with the knowledge that it is the purpose of the Commonwealth to see that the principles herein outlined are enforced."

—Eighty per cent. of the tonnage on the great lakes has been tied up by a strike of the 'longshoremen, firemen and other unskilled workmen at Buffalo, Cleveland, Chicago and other ports, who

seek thus to compel recognition of a union organized by the mates or pilots. Their action has made 50,000 men idle. —Work upon the new steel frame buildings in Chicago has been interrupted by a strike of the structural iron workers for an increase of pay.—Operators representing \$100,000,000 of capital invested in the bituminous coal mines of the Clearfield district in Pennsylvania met last week and decided to insist upon the "open shop," and to make no further agreements with the miners' union. Altho no strike has been ordered at their mines, their miners have been idle for some weeks.

**Various Topics** Many additional indictments for land frauds have been reported in Portland, Ore. Among those accused and arrested are several capitalists of Oshkosh, Wis., who are charged with stealing 160,000 acres in Klamath and Lake counties. An indictment returned on the 6th contained the names of twenty-one persons, among whom were residents of Michigan, Minnesota and Arkansas. They are to be prosecuted for conspiring to steal 200,000 acres of fine timber land.—Robert M. McWade, formerly Consul-General at Canton, who was removed on the recommendation of Assistant Secretary of State H. H. D. Peirce, and whose conduct was sharply criticised in that officer's recent report, has defended himself before the House Committee on Foreign Affairs, producing affidavits in which prominent residents of Canton say that all the signers of the petition for the Consul's removal are disreputable men, and asserting that Mr. Peirce practically demanded from him as a present a tiger skin rug valued at \$500. A few hours after McWade had thus testified the rug was returned to him by Mr. Peirce. The latter will testify in reply to McWade's statement.—The Senate Committee on Post Offices having declined to make an investigation as to the ejection of Mrs. Morris from the White House by Benjamin Barnes, recently nominated to be postmaster at Washington, Senator Tillman has introduced a resolution instructing the Committee on the District of Columbia to inquire as to the treatment of

Mrs. Morris by the police, and "whether the Superintendent of Police and one of the chief witnesses against Mrs. Morris have since received recognition by the appointment of near relatives to office." Confirmation of the nomination of Barnes has been opposed with much vigor by Mr. Tillman in the executive sessions.

#### The Philippine Islands

The greater part of the income to be derived from the \$7,000,000 paid by our Government to the three religious orders for the friars' lands will be expended in the islands. It has been decided by the Vatican that the interest shall be distributed annually as follows: One-third to the Philippine dioceses; one-third to the institutions established by the orders in the islands; one-third to the orders for their missions and for the support of aged friars who have left the archipelago.—A bill postponing for three years, or until April 11th, 1909, the application of our coastwise navigation laws to trade between the islands and the States, has been passed by Congress with but little opposition.—On the 21st ult., in the town of Maraquina, a few miles northeast of Manila, 2,000 dwellings were ruined by fire. Many of the homeless residents are said to be starving. Fire also destroyed, on the same day, the town of Pasil, near Cebu.—Archbishop Harty, of Manila, has addressed to the Philippine Commission a protest against a proposed suit of the Government for the ejectment of himself and the Franciscan Brothers from possession of the San Juan de Dios Hospital and estates, saying that it is an attempt to confiscate property of the Catholic Church. He also publishes a long review of "A History of the Philippines," the author of which is Dr. David P. Barrows, the Philippine General Superintendent of Public Instruction. He asserts that this book, "prepared for the use of the public school children of the islands," is unjust to the Catholic Church and to Spain.

Cuba Congress, in joint session on the 4th, counted the electoral votes and proclaimed the election of President Palma for another term, with

Mendez Capote as vice-president. All of the 81 votes were cast for these candidates. Rumors reached the coast cities of Florida that a revolutionary movement had taken place at the eastern end of the island, under the direction of Modesto Leal, a labor leader. At last reports, these rumors appeared to have had not the slightest foundation in fact.

—During a debate in the Senate upon a bill providing that the island's coastwise trade should be reserved exclusively for Cuban vessels, Señor Zayas referred to assertions made in one of the Havana newspapers that Americans had bought a million acres of land in Santiago province and had purchased even a larger tract in Camaguey. He asked for legislation providing that aliens in whose native countries foreigners were forbidden by law to own land should not be permitted to own land in Cuba.

#### May Day in Paris

The friends of France can breathe more freely now that the 1st of May and Election Day have passed without fulfilling any of the direful predictions which were generally heard. The atmosphere has become cleared, strikers are returning to work, and the Government is stronger than ever before. Work in the coal fields of the Pas-de-Calais district, which has been interrupted since the great disaster at Courrières, is now being resumed. The only labor troubles of importance are in the French ports of Cherbourg, Toulon and Dunkirk, where the employees of the Government navy yards are striking for an eight hour day. The precautions taken for the preservation of order on May Day by the Prefect of Police in Paris, M. Lepine, under the direction of M. Clemenceau, Minister of the Interior, proved to be sufficient. The large number of troops massed at the capital and stationed in strategic points about the city kept the crowds in the streets moving and divided, so rioting was nipped in the bud. In the Place de la Republique, the site of the Bastille, the largest and most dangerous crowd collected, and in dispersing them by cavalry charges there were many injured. The casualties reported are 13 policemen and 60 other persons wounded by stones and saber cuts. Prefect Lepine spent the

day in passing from one point of disturbance to another in an automobile, haranguing the mob or directing the movements of the troops. When on foot in the midst of the crowd in the Place de la Republique, a zealous policeman seized him by the collar and began to drag him off to the station. Over a thousand arrests were made, but only about 150 of them were retained for trial.

### The French Elections

It was generally thought, even by the friends of the present Government, that it would lose in the coming election, and very likely enough to turn the majority in the Chamber of Deputies against it. In support of this view it was argued that the devout Catholics were all incensed at the Government for its forcible invasion of the churches in taking the inventories, and that the Government had lost the support of the workingmen by its use of troops to maintain order in the Pas-de-Calais district and Paris. The result was quite the opposite of that predicted. The Sarrien Ministry, so far from being put out of office, has its majority in the Chamber of Deputies increased by about 20. The French law requires a majority of votes for election, instead of a plurality allowed in this country, and as in many districts there were three or more candidates, second elections will have to be held on Sunday, May 20th, in over one hundred places in which the two candidates receiving the highest number of votes will be eligible. The Government made gains from the Clericals, even among the peasants of Brittany. The most conspicuous feature of the election of May 6th was the marked increase in the Socialistic vote. The Socialist party in France is now united for the first time in many years by the fusion of the Parliamentary wing headed by Jaurés with the strict Marxian Socialists—and their increased power will probably cause them to assume a more independent attitude and to exert an influence upon the Government which will force it to introduce still more radical legislation. The returns from the elections indicate that the next Chamber of Deputies will be made up about as follows: Conservatives and

Liberals, 74; Nationalists, 22; Progressivists, 70; Republicans of the Left, 63; Radicals, 77; Social Radicals, 85; United Socialists, 33, and Independent Socialists, 10. Of these about 258 may be counted on to support the present Government, giving a majority of 82 over a possible combination against it of the extreme Right and Left.

### Parliamentary Russia

What promises to be a new era in the history of Russia begins this week in the assembling of its first national congress, the Duma. It meets under very favorable auspices, for the Government has apparently abandoned the plan of opposing it and reducing its importance by lack of ceremony in opening it, and on the other hand the elected members have shown remarkable sanity and wisdom in the adoption of platform and tactics. On the eve of the assembling of parliament the Czar has made an unexpected move, the significance of which is not now clear. He has put a stop to the long and bitter struggle between Premier Witte and Minister of the Interior Durnovo by dismissing them both together from the cabinet. The imperial rescript thanks them for their patriotic services, confers honors upon them and makes them both members of the Council of the Empire, the upper house of the new parliament. The new Premier is Goremykin, who has filled the offices of Minister of the Interior and Minister of Justice. He is said to be an enemy of Count Witte's, because the latter in 1899 exposed to the Emperor the falsity of an official report he made minimizing the extent of the famine. On the other hand he is said to have a strong sense of justice and legality and will not be likely to countenance any high handed proceedings against the Duma or anti-Semitic riots. He and the other members of the new cabinet are men of slight reputation and presumably of mediocre ability, and will perhaps be soon replaced by ministers chosen from the Duma. An unprecedented step was taken when Schwanebach, Controller of the Empire in the new cabinet, sent for an Associated Press correspondent and gave out an official explanation of the dismissal of Premier Witte. He said that

it was because he had failed to secure the support of the Liberal element of the country and also to repress disorder and revolt. Finding himself beaten at the polls he had attempted to render the Duma fruitless by issuing the fundamental laws, which greatly restricted the rights already granted to the representatives of the people. He had also endeavored to settle the land question by promulgating a plan for buying the estates of the nobles for distribution among the peasants. Neither of these acts, it is now explained, had had the approval of the Emperor, and it is the policy of the

Premier Goremykin, Who Succeeds Count Witte as Head of the Russian Cabinet.

Government to work in harmony with the Duma. Measures will be introduced by the Government granting amnesty to political prisoners, abolishing the death penalty and creating a parliamentary commission to inquire into the acts of Government officials. In spite of this official disclaimer of the acts of Witte, the fundamental laws were signed on May 5th by the Emperor in nearly their original form. The caucus of Constitutional Democrats, forming a majority of the Duma, has settled upon these same three measures as their primary and indispensable demands, so if both parties are sincere they will be able to work in harmony. Besides these the Constitu-

tional Democrats will work for inviolability of the person, equality before the law, the introduction of secret, direct and universal suffrage and agrarian reform. The party has formed a compact organization and will be controlled by a central committee, of which Naboukoff is the head. During the session of the preliminary caucus of the Constitutional Democrats the news was received that Governor-General Doubassoff had been assassinated in Moscow, and the convention took a recess and cheered the deed for ten minutes. It was afterwards learned that the Governor had escaped, as the bomb that had been thrown at his carriage missed its aim, and exploding in the rear killed the assassin himself and three other persons. The life of Governor-General Doubassoff has been three times attempted on account of the severity with which he quelled the Moscow rising. The Governor-General of Ekaterinoslav was killed by the Terrorists May 6th, and Count Alexis Ignatieff, a prominent reactionary leader, on May 8th.

#### The Turkish-Egyptian Question

The dispute over the boundary between Turkish and Egyptian territory on the Sinaitic peninsula has reached a critical point and the outcome is in doubt. The British Ambassador at Constantinople, Sir Nicholas O'Connor, presented to the Porte on May 3 an ultimatum demanding the withdrawal of the Turkish troops from Taba within ten days, and Turkish consent to a joint demarcation of the boundary line. The British fleet is assembling in Greek waters for the purpose of a naval demonstration in case of a refusal on the part of Turkey to agree to these conditions. The French, Italian and Russian Ambassadors at Constantinople are said to have urged upon the Porte the necessity of compliance. The German Government has denied that the action of Turkey in the matter was inspired by German influences.

#### Chinese Control of Tibet and Manchuria

The president of Wai-wu-pu, or Board of Foreign Affairs, of the Chinese Government is Tang-shao Yi, a graduate of Yale and a

man of ability, whose influence is now plainly seen in the new diplomacy of China. He has just concluded the negotiations with the British Minister at Peking, Sir Ernest Satow, in regard to the treaty which Sir Francis Younghusband secured at Lhasa on September 7th, 1904. Since the Dalai Lama fled at the approach of the British to the Forbidden City, his signature could not be secured to a treaty with Great Britain, so the object of the expedition seemed lost, altho Colonel Younghusband obtained the approval of such Tibetan authorities as he could find. In order, therefore, to make the treaty valid Great Britain was willing to recognize the suzerainty of China over Tibet, which she had apparently ignored when she insisted on treating directly with Lhasa, instead of Peking. What is apparently a new treaty has now been concluded with China which provides for the recognition by Great Britain and Tibet of the Chinese protectorate over Tibet. Great Britain undertakes not to interfere in the internal affairs of the country unless other Powers do so. China agrees to open some of the Tibetan markets to Indian trade; to construct telegraph lines in Tibet; and to give Great Britain preference as regards railway concessions. China further agrees to pay 2,400,000 taels (about \$1,700,000) as indemnity for the cost of the Younghusband expedition to Lhasa.—Tang-shao Yi's diplomacy is also seen in the delay of the opening of Manchuria to the commerce of the world. The Japanese Government has informed the world that Antung and Tatung-Kao, the ports we secured for trade by treaty with China in 1903, are opened from May 1st, and that Mukden will be open June 1st, but that merchants must assume their own risks, as the Japanese Government will not be responsible for any damage by bandits. But the Chinese Foreign Board has interposed on the ground that the localities for foreign residents have not yet been determined and the regulations have not been drafted. What these regulations will be is not known, but it is supposed that foreigners will not be permitted to buy land in Manchuria, and that so far as possible the development of the country will be retained for the Chinese.

### Independent Movement in the Polish Catholic Church

The proclamation of religious liberty in Russia has shaken also the strong foundations of the Catholic Church in Poland. A regular movement against the Church in its present status has arisen, especially in Western Poland, and the effort is being made to effect an independent organization, separated from the mother Church, or, perhaps more correctly, to be driven out by the latter. This independent agitation is that of the "Mariavites," which was originally a popular movement within the Church itself, similar to the great agitation of the thirteenth century, which led to the organization of the mendicant orders, who also afterward turned against the Church organization. The present movement, too, is now already engaged in an active struggle with the Primate of Poland and his bishops. The soul of the whole propaganda is the prophetess Kozłowska, who had been engaged in the manufacturing of articles for churches, such as altar cloths, robes, and the like. She began by claiming to have seen visions of a higher order, and then severely censured the Church of Poland for its worldly spirit and appealed especially to the younger clergy of Poland to lead a higher and more spiritual life and to cultivate a deeper and more heartfelt type of personal piety. This appeal soon brought a host of followers, and among them a goodly number of the younger clergy, including the students of the Warsaw Diocesan Theological Seminary. When the new prophetess rejected the worship of the saints and demanded devotion to the patroness of Poland, the Madonna of Czenstochau, the hierarchy concluded that the time had come to intervene against the Mariavites. Archbishop Popiel, of Warsaw, published solemn warnings against the new movement, the bishops employed their personal influence against them, and even the political authorities were induced to antagonize the new heresy. But all this has practically been of no avail. Whole congregations, with their priests as leaders, have joined the sect; and at some places bloody contests have been the order of the day for the possession of the church.

# Stanford University and the Earthquake

BY DAVID STARR JORDAN, LL.D.

PRESIDENT OF LELAND STANFORD, JR., UNIVERSITY.

THE backbone of the peninsula of San Francisco is formed by a softly rounded mountain chain, locally known as Sierra Morena, or Sierra Santa Cruz. This rises to the height of about 3,500 feet in the peak called Loma Prieta, growing gradually lower to the northward, where it passes into the sea. Along the east base of this mountain for forty miles or more extends a sharply defined narrow valley, known in different places as Steven's Creek, Portolá Valley, Cañada del Raymundo, Spring Valley, San Andreas, and extends northward by Mussel-shell Rock across the Golden Gate to Bolinas Bay and Tomales Bay. This marks an old fault of geologic times. Where it was made, the rocks on the east side fell some 2,000 feet as related to those on the west, which constitute the Sierra Morena.

Most of the earthquake shocks about San Francisco have been due to frictions and readjustments along the line of this old fault. The very violent shock of April 18th was clearly due to this. The old fault in the rock reopened, breaking the surface soil more or less for a distance of upward of forty miles. The mountain on the west side of the fault slipped to the northward for a distance of between three and six feet without change of level on either side. The strain on the mountain, whatever it was, became relieved, and after various petty tremors of readjustment the earthquake was over.

From the first grinding movement along the line of the fault, waves of intense violence were propagated along the earth. The motion was horizontal, at first back and forth, and then as waves from more distant points came in, they coalesced into most extraordinary twists.

The result was the snapping off of chimneys and spires as tho from the lash of a whip. Brick walls were crumbled and feeble buildings crushed like egg shells. Buildings of steel construction swayed in wide amplitude, to the injury of their neighbors. Solid masonry stood fairly well if not too high. Buildings of steel structure were mostly unharmed.

Concrete reinforced by steel wire (Ransom construction) bore the shock perfectly. Wooden houses were unharmed as to walls, but generally lost their chimneys, which were often broken off at the base. Pictures and crockery were flung about, and the plaster on the first floor largely thrown off, that of the ceilings being intact. Roofs in general were unharmed.

The direct damage of the earthquake in San Francisco was not great. Old brick buildings were crumbled, and chimneys flung about, but the modern steel structures received little if any injury. Even the slender Call Building, some thirteen stories high, swayed in perfect rhythm. The ruin of San Francisco was due to the fires, which broke out simultaneously in dozens of places in the closely built wooden and brick district south of Market street. The water mains were broken in the west of the city, and the whole business portion and much of the residence area was helpless.

The story of the wonderful courage of the people of San Francisco and the instant adequacy of the military commandant, General Funston, has been told by many others, and others still will relate the story of the growth of the new San Francisco, which shall resist fire and earthquake.

Stanford University lies about five miles to the eastward of Portolá fault. The shocks succeeding each other instantly were tremendous, and the tall structures and the unfinished buildings with soft mortar suffered greatly.

The injuries are summarized as follows:

1. The Memorial Church. The spire of wood, weighted by tiles, plunged thru the nave of the church. The concussion of air forced off the church front with the great Mosaic, "The Sermon on the Mount." The flying buttresses of the tower fell crashing thru the apses. Otherwise the church suffered little. The bells and the organ are unharmed, the steel-braced walls are perfect, the mosaics and stained glass windows are mostly intact.

The church will doubtless be some

time restored, but with a Spanish dome, rather than the spire and flying buttresses of its American prototype, Trinity Church in Boston. These structures represented the chief deviation from Spanish types of architecture in the Quadrangle. The arcades, or cloisters, forming a singular effective part of the architecture of the quadrangles, are little harmed.

2. Wreck of the unfinished library. The great dome and its steel supports are unharmed; their swaying completely wrecked the rest of the building of stone and brick.

3. Wreck of the new gymnasium, of brick faced with stone.

4. Wrecks of parts of the art museum, which were made of brick faced with cement. The central part, of concrete strengthened by steel rods, is intact, but statues, vases and pottery generally are crushed.

5. The Stanford residence in San Francisco, a huge wooden structure, heavily built, is not harmed by the earthquake, but is completely consumed by fire. The Stanford residence on the university campus, a thick walled structure of brick and stucco, is totally wrecked.

6. The inner quadrangle and engineering shops, of heavy masonry, and one story high, are unharmed.

7. The outer quadrangle contains four large buildings reinforced by steel, the laboratories of zoology, botany and physiology, with the temporary library and assembly hall. These are virtually unharmed.

8. The power-house was wrecked by the tall stone chimney, which was snapped off like the lash of a whip.

9. The memorial arch had its upper part snapped off, and is split almost to the base, so that it is an entire wreck. This structure was of brick, reinforced with steel and faced with stone.

10. The chemistry building lost all its chimneys, and is externally damaged by the fall of part of its stone facing. The building and its contents are little injured.

11. The four large buildings of the outer quadrangle, of brick faced with stone, are somewhat damaged, the history building least, the incomplete mining building most.

12. Roble Hall, the women's dormitory, of concrete with steel wires, is absolutely unharmed except for the fall of two ornamental chimneys.

13. Encina Hall, men's dormitory, a very large, finely built brick and stone building, of heavy masonry, well reinforced, was injured by the fall of stone chimneys, one young man being killed. The building also has a serious crack in each of two corners, but is otherwise unharmed.

The loss in all amounts to between \$2,000,000 and \$3,000,000. The first aspect of the buildings was appalling.

But discouragement is an unknown idea in California. It is men, not buildings, which make a university. The future will know generous givers as well as the past, and the example of the unstinted devotion of the founder will not be lost on the university's students and friends.

What to do is simple enough. The débris about the quadrangle is being carried away and sorted. The damages to class rooms, laboratories and dormitories will be repaired at once. Everything in the future will be so far as may be earthquake proof. For the next forty years our neighbor, the Portolá fault, will be, as in the past, a most interesting object for observation of students in geology, and as quiet and pretty a little valley as was ever filled in May with poppies and wild hyacinth.

The endowment of the university is large and undiminished. To the gift of the founders was attached the wise condition that no part of the principal should ever be taken for any purpose, and that the institution should never run into debt. This clause hampers us for the present. It secures the future of the university. It will be respected in letter and in spirit. The working buildings once restored, the rebuilding of the rest will be continued very slowly. The two universities of California exact no tuition fees, and receive no income from students. All building and all rebuilding must therefore come out of the current income or from the gifts of those to whom the courage, faith and freedom of Stanford University may appeal. No university ever had more loyal alumni.

# The Persistence of Personal Force in American History

BY WILLIAM GARROTT BROWN

AUTHOR OF "THE LOWER SOUTH IN AMERICAN HISTORY," ETC.

HISTORIANS, like other bookish people, fall readily into the habit of controverting popular opinions merely because they are popular; but in one respect history finally conforms, almost as often as literary criticism does, to the intuitions of the multitude. I mean, in its estimates of the greater kinds of men. Sometimes the agreement comes only by something like a complete surrender of the learned few to the unlearned many. That, however, need not drive us to accept Lord Melbourne's despairing conviction that when all the educated, well-bred, intelligent people of the kingdom were on one side, and all the Melbourne-blasphemed fools on the other, the latter were sure to turn out right. Perhaps—daunting conjecture!—the historians and the multitude both sometimes go finally wrong. But with their agreement it is hard to disagree.

How well-nigh perfect their agreement occasionally becomes was recently rather curiously borne in upon one member of the historiographic brotherhood. Wedged into the cheerful crowd that on an election night packs several miles of Broadway in New York, watching the returns thrown by a stereopticon upon a screen in front of a newspaper office, he hardly looked for fresh light on any history less recent than that the day had made. But when returns failed the stereopticon supplied other amusement—doggerel verse, scenes from comic opera, portraits of the day's candidates, and portraits of the candidates of other days. It was interesting to

watch how now applause, now jeers, now both, and now silence, greeted the faces that successively appeared. When, however, between two more recent celebrities, the worst of all the well-known portraits of Lincoln appeared, there ran thru the crowd but one sound—a low, reverent, affectionate murmur, which voiced indescribably well a tribute that no other dead or living American could have won from that careless throng. Yet it was the very tribute which History, having no voice, but only a pen, strives vainly to pay.

In much of his work the historian gets no prompting whatever from the multitude. Concerning many of his themes, such as institutional growths and economic causations, it is quite silent. Concerning causes and doctrines he consults it at his peril. Even in the distinctly biographic parts of his work it sometimes fails him. But the varying fullness of the aid and guidance it gives is in itself a thing not without significance. The greatness of great men is of many kinds and sources, but one kind consists principally in the power to take lasting hold of the affections, to win a permanent place in the imaginations, of that great majority which, if it turn to history at all, turns to it only for heroes, for men.

We may analyze the sources of information of the multitude, and yet not destroy the delphic authority of its pronouncements. The main sources, no doubt, are novels, plays, statues, portraits, and word-of-mouth tradition. But all these cater to the multitude's prefer-

ences, cherishing what it cherishes, neglecting what it neglects. The popular novelist's, playwright's, sculptor's, painter's standard of choice is essentially the popular standard. Could we ascertain and formulate that, we should be by way of dealing intelligently with a vague but intensely felt opposition and controversy between two schools of writers about the past.

The multitude here meant is not, of course, the transient, contemporary multitude that watches history in the making and helps to make it, but the abiding multitude that occasionally glances back at history already made. The abiding multitude is fairly constant in its notions about the past, yet most of these are ultimately derived from the contemporary multitude, to which fickleness is always attributed. There lies the source of tradition, and there, too, the source of the safest inspirations of the romancer, the dramatist, and other caterers to the abiding multitude's tastes. Undeniably, the contemporary multitude's partialities are subject to many accidents in the handing down to posterity. Tradition, often as it errs, is yet probably the safest carrier of such wares. A single novel like "Ivanhoe," a play like Bulwer's "Richelieu," a poem like Macaulay's "Battle of Ivry," will enlarge, as mere tradition or less successful literary celebration cannot, the interest in its hero or its villain. But the contemporary multitude's preferences remain, none the less, the beginning of the most real immortalities—the immortalities of personality.

Let us examine for a moment—as one examines a child's treasures, if you will—the preferences of the two multitudes among the chief characters in American history, understanding always that preference means merely singling out for interest and remembrance, not necessarily approval.

Out of the extraordinary group that guided the Revolution and formed the National Government, how many survive to-day, save as mere names, outside of the closets of a few scholars? Washington, of course; but as a statue rather than a man, as wisdom and virtue molded into a noble human form, but not incarnated, as an immense presence without voice or heat or action. A too sol-

emn reverence, often reacting into a cheap levity, dull moralizing provoking dull buffoonery, this is the response to the annual parading of his image before the eyes of the nation. The great majority concedes his primacy among all our public characters, but without enthusiasm, without affection, without resentment. It does not, in fact, *know* him at all. The truth may be that in this it merely repeats the mood and attitude of the great majority of his contemporaries. Now, as then, he suffers from the perfection of that self-control which denied his inmost self even to the most favored of his familiars. Only one of his great associates, it is said, ever dared to lay a hand on his shoulder, and he but once, and now posterity keeps its distance equally well. It is no wonder that the historian who has most closely attended to popular conceptions of events and men sets the foremost American down as "the cold and forbidding character with whom no fellow man ever ventured to live on close and familiar terms." Some of us may think that judgment unjust, but it is doubtful if the most sympathetic intrusion, any more than the most flippant iconoclasm, will ever successfully invade the chill austerity in which, as in perpetual snows, his mountainous fame is wrapped.

Not a few of his associates in nation-building share his effect of coldness and inaccessibility. Others, still less fortunate, do not even in that way inhabit the horizon of the thought of living men. They survive only in the work of their hands, in their contributions of things done, or of ideas, which are long since dissociated from themselves in their individual, human characters. But certain others have still some persistence as persons, as men. They keep visible shapes. They are liked or disliked. Perhaps it will be well to couple one or two of those who do thus personally persist with their several closest counterparts among those who do not.

Of the two orators of the Revolutionary impulse, James Otis and Patrick Henry, only Henry still speaks to the mass of living Americans. Had the partiality of certain historians, themselves without the instinct of popularity, much availed, Otis would have gradually

gained rather than lost in the comparison with the Virginian. But somehow the accounts of him merely inform us about him; they do not bring him before us. While thousands, at the mention of Henry's name, will have a distinct vision of the tall, awkward, rustic lawyer, will see him defying tyranny with dramatic gesture and burning eyes, will recall, too, the place and setting of his outburst, to mention Otis or the Writs of Assistance paints no picture, stirs no sympathy. For the multitude, it is Henry who will forever voice the distinctive aspiration and passion of his age. And here, I take it, no Scott or Boswell has intervened.

Another contrast is less striking. Jefferson the man has on the whole prevailed over Hamilton the man much as Jeffersonian theory prevailed over Hamiltonian purpose and energy while the two still lived. Publishers' lists, campaign oratory, newspaper leaders, pseudonymous newspaper correspondence—all indicate that the philosophic dreamer and schemer keeps his sway over men's minds far better than does the most masterful spirit and the most indisputable genius of the entire revolutionary group. In the force of his immediate contacts with his contemporaries, Hamilton doubtless surpassed all but Washington, and he could move Washington himself as no one else ever did. In the correspondence of his intimates, one feels his influence running through conventions, congresses, cabinets, like an electric current. Following his footsteps is like walking in the path of a hurricane. Beside his stirring, crowded record of swift and brilliant achievement, as soldier, statesman, party leader—leader always—with its sudden, tragic ending, Jefferson's looks almost tame and humdrum. Yet today the multitude knows Jefferson's life better than it knows Hamilton's. The less vivid personality had the longer reach.

As both, however, after a century, remain fairly distinct in their countrymen's apprehension, they stand together in contrast with Madison, who for the mere persistence of his ideas and the endurance of his handiwork stands well enough the comparison with either, yet who, despite all that scholarship can do for him, remains to the many what Irving called

him—"a withered little applejohn"—the palest ghost of all the really great American dead men. Living, he aroused no passionate loyalty, provoked no violent hatred, subdued with no repelling awe and stateliness; dead, he is neither bitterly assailed nor warmly championed, neither revered nor reviled. His wife more nearly survives as a person than he does. No better representative could be found of the class of men who in conspicuous posts and memorable tasks miss observation and remembrance.

Other instances illustrate the unjudicial character of popular appreciations. Great as are the debts we owe Franklin for his homespun philosophy, his pioneering in science, his diplomacy, his invaluable combination of worldliness with patriotism in many services, he profits more in popular remembrance by his wit and humor—for he had both—and by the mere charm of his spectacled face and immense, skull-capped head. *Per contra*, neither wit and worldliness nor rugged honesty and a wooden leg have served to advance Gouverneur Morris from the shadowy background. Samuel Adams, for all his expertness in the guidance and control of public sentiment in his own time, fares little better with posterity than his tactless cousin John. In the case of the mere soldiers, the pointedness of the multitude's preferences is still more striking. Greene, doubtless the first after Washington, is less distinct than the far less meritorious Gates. His competence does not catch the eye as does the self-esteem which somehow swells out Gates's Continental uniform into an abiding image of pretense and fussiness. Neither appeals to the story lover as does Putnam or Marion, Daniel Morgan or Ethan Allen. But this train is endless.

From a later group five must suffice. In the long peace that followed the two wars with Great Britain no public character matched Andrew Jackson for distinctly personal ascendancy. No other American, in fact, ever had such a gift and instinct as he had for projecting himself into all he did—for thrusting his personal characteristics and experiences, his likes and dislikes, his loves and hatreds, deep into the political life of the Republic. By virtue of that gift he mar-

velously commended to his countrymen brawling and profanity and ignorance and prejudice and provincialism, along with courage and will and crude patriotism and still cruder chivalry. Mainly by virtue of it he outdid four great rivals for the first place in the public eye. Henry Clay and John Quincy Adams he overcame in direct rivalries. Calhoun he drove entirely out of the contest for national leadership. To Webster he left merely the roll of orator of nationalism, while he himself stood forth as its true representative and champion. He is our best exemplar of the power of the person in public life. And all this is the more remarkable because he had in Clay at least one rival who in almost any other period would himself have been unrivaled in the same kind of distinction. The career of James G. Blaine may perhaps indicate what Clay, a far finer representative of the same type, might have been to his generation if Jackson had not belonged to it. Adams, one feels, had no chance for that kind of distinction with his contemporaries, and his crabbed integrity, his caustic idealism, have not, as one might have expected, grown more winning with the flight of time.

To the other two of the quintet, however, time does seem to be making some amends. Calhoun, whether as the North takes him—the lost mind, the nightmare-tortured statesman of slavery—or as the South's canonized precursor of consecrated disasters, is as distinct and distinguished in our political as Poe is in our literary history. Webster, too, is safe—whether as “Black Dan,” careless of debts and of very human appetites, or as the more widely but less intensely apprehended “immortal Daniel” of the Bunker Hill oration and the reply to Hayne, or as the fallen idol of the Seventh of March speech. Meanwhile, Clay's speeches are not read; he lives chiefly in his rivalries, seldom escaping from being either coupled with Jackson or joined in a trio with Webster and Calhoun into any individual eminence of his own. Nor has Jackson's fame altogether escaped diminution. His more serious claims to honor and gratitude seem to be neglected by the many in proportion as they gain consideration with the

few. Tradition and anecdote cherish chiefly the Jackson of strange oaths and incoherent rages, the uncompromising friend and enemy, the frontier fine gentleman.

Even with the group of leaders who guided the Republic thru the last political contest over slavery and thru the Civil War, the abiding multitude seems already to be perceptibly departing from the contemporary multitude's preferences. The most striking instance is the swift waning of the fame of Stephen Arnold Douglas. For ten years the barrator and protagonist of fierce party strifes, unusual in mind and body, overloved and over-hated, with the first rumble of the guns he drops out of sight almost as if a stage trap sank beneath him. Like Clay, he owes the interest men still take in him chiefly to a rival—Lincoln—and not to his own leadership, which in fact lasted longer than Lincoln's. Only less surprising is the shrinking of the figure of Salmon P. Chase, which conspicuously fronted that of Douglas long before Lincoln rose to any national eminence. Seward, too, is well nigh reduced to a mere relief on the pedestal of Lincoln's fame, and even there he and Chase stand out less distinctly than the square frame and bearded face of Edwin M. Stanton, who gains by having been so antithetical to his chief. Sumner, on the other hand, gains distinctness from the choice or circumstance that detached him from the entire group immediately surrounding Lincoln, and kept him to the end within the walls of the Senate, the set-speech orator of the cause whose hustings orator was Wendell Phillips—to that, and to the monumentally foolish violence of Preston Brooks. In Sumner, Phillips, and Garrison, it is worth noting, New England at this time contributed three men who possessed, as no earlier New England publicist except Webster had possessed, the power to appeal to the popular imagination. If a fourth should be added, it must be John Brown rather than any Adams. A fifth soon followed in Thaddeus Stevens, who with the end of the war and the dawning of that strange peace which to a third of the republic seemed worse than any war halts dramatically to the front of the stage and thenceforth dwarfs even Sum-

ner in the tyrannous advocacy of liberty and equality. With more and more Americans, as time passes, when the word Reconstruction is pronounced, the first shade that arises is the shade of Stevens, the aged arch-radical.

The Civil War captains are too many to consider, and if we come past the Civil War and Reconstruction our two multitudes merge. Yet I should prefer to go on with this rambling list rather than attempt a fit concluding generalization.

We shall not find a principle or formula to explain the persistence of one historic personality, the obscuration that overtakes another. We shall never, for that matter, be able to draw the line between the remembrance which comes of deeds, ideas, contributions, and that which belongs distinctly to the person. But that the great majority does, obedient to unknown laws of choice, fasten upon certain conspicuous personalities with a lasting predilection, ignoring others, is hardly disputable; and from the fact there might well arise a fresh questioning of our standard of values in the past. For how else, after all, does the past so vividly or so practically concern us as by this projecting of vanished personalities into our lives? If, therefore, historians feel bound to trace so carefully the growth of certain institutions because they persist, why may it not be equally reasonable, even tho it is more interesting, to set forth as carefully the growth and spread of great and persistent personal influences? Moreover, the multitude goes to the past for what it likes, not for what historians commend. If we consider how we all daily reject men and things commended to us by mere worth and importance, preferring

interest and charm, we cannot greatly blame the multitude. If we consider how a right hospitality takes account of likes and dislikes in the assembling and pairing of guests, we cannot greatly blame the historian if, playing host in the great hall of the past, he admits a similar principle into his hospitality, and exercises a like discretion in the parading of his shades. Surely he may, if he can, do accurately and responsibly what the romancer does inaccurately and irresponsibly.

If he can: there's the real rub. For to do it he must have even more than his perplexing office now demands of skill, of art, of patience—of the loving patience which is so nearly the soul of art. History, one fancies, will not, here in America, rise to this opportunity until romancers and dramatists and painters and sculptors shall more abundantly supply the historian with examples and object lessons in the handling of his own themes and characters; certainly not until the historian shall desire, as earnestly as he desires soundness and competence in any other part of his work, to bring his famous personages—his Washingtons and Hamiltons and Jacksons and Websters and Lincolns—alive into his story. Once possessed with that desire, he may find that he needs less than he now needs the tutelage of the romancer, the prompting of the multitude. For he will have in his work the same kind of zest which the romancer has in his; and he will discover that as a single shell carries all the voices of the great sea, so he himself carries in his own bosom the sympathies, the resentments, the intuitions of both the multitudes.

NEW YORK CITY.

# Another of Our First Families

BY E. P. POWELL

AUTHOR OF "THE COUNTRY HOME," "OLD FARM DAYS," ETC

THE citrus family is destined to do a great deal more for human welfare than it has done in the past; altho that item is by no means insignificant. Botanically, the family gets its name from the least important of its members. The citron was formerly held in high esteem; before the orange had escaped from an undeveloped and uncivilized condition. It is a large, lemon-like fruit, with a very thick skin, and at present the fruit is used for no other purpose than preserving its rind. It is cultivated to some extent in the warmer parts of Florida and California, and is also found in the countries around the Mediterranean, altho sparsely. It has the habit of sending low lateral limbs out in all directions, and these take root wherever they touch the ground. It is necessary to cut these limbs away when the trees are grown in orchards. The orange has of last years grown into pre-eminence, while the citron has dropped into comparative insignificance; yet we are never sure that out of these primitive stocks there may not be developed something more marketable. Almost every year some old-time weed is exalted into floral beauty, and some despised bush is made over into a fruit bearing or nut bearing tree. Tomorrow will also have its miracles.

Fifty years ago an orange was such a rarity in the Northern markets, that I do not think I ever saw one before I was ten years of age. The prospect now is that they will become as common as winter pears, or possibly even winter apples. The output of oranges from California has climbed up to nearly or quite 5,000,000 boxes, while that of Florida is rapidly regaining the millions shipped before the freeze of 1895—it will soon go ahead of that figure. The year previous to that unprecedented freeze the output was 6,000,000 boxes

from that State; but the year after it dropped down to 75,000 boxes. For the last three or four years the crop has been estimated at something over 1,000,000 boxes per year. I know a small town that shipped 40,000 boxes each year, but now only 1,500. All sorts of devices have been used to protect the groves from possible blizzards; but I believe that the only reliable method is that of kindling fires, when danger is anticipated. You will find, up and down between the rows, piles of pine logs, about the size of railroad ties—always kept on hand by thrifty growers; and this resinous timber is very quickly fired in case of need. If the wind blows very severely, the protection is unequal thruout the orchard—in some cases there will be occasional blistering of foliage.

Orange trees, whether planted in rows or not, are designated as a grove rather than an orchard, because the first oranges were wild seedlings growing in the forest, from seeds of sour oranges, scattered by the Indians. These sour oranges were planted by the Spaniards very early after they began their settlement in Florida. Wild groves always occurred in openings among live oaks; and it was not until these oaks had been nearly all cut down, that their protecting power was realized. The first check to the development of orange growing occurred in the winter of 1885-6. From that time on young orchards, all the way down to Tampa, have been occasionally injured—sometimes seriously; altho the old trees have survived and borne fruit. The industry had developed with great rapidity until the winter of 1894-5, when by successive frosts, in the month of December, over \$100,000,000 worth of fruit and trees was destroyed. The orchards at present show very few of the old style orange trees, but are mostly the result of budding the suckers that came up

around the stumps of the frozen trees. These suckers number from three to seven or eight; and the result is round, shrub-like trees, about 12 to 15 feet in diameter. It is one of the most beautiful sights conceivable, when these bushes or trees, almost as round as a ball, and reaching near the ground, are filled with their golden glow.

It is a curious fact that the orange groves of California have become acclimated to colder weather, so that they suffer very little damage under conditions that would destroy the trees of Florida. In that State the first cultivation of citrus fruits was by the Spaniards, in connection with their missions, and it extended all the way from Lower California to fifty miles north of San Francisco. After the freeze in Florida there was a boom in planting California trees; until now the orchards run thru a belt 700 miles long and 25 miles wide. It is estimated that there are between 4,000,000 and 5,000,000 trees, now in process of growth on the Pacific Coast.

It is not generally known that there is a small, but distinct orange section, in the Mississippi delta. New Orleans, Galveston and Mobile absorb the whole product of this favored region, so that a box is rarely ever seen at the North. The Louisiana orange ripens earlier than that of either Florida or California, and brings such good prices that it pays the grower to take special care of an orchard. The trees are banked up with soil, several feet high, whenever threatening weather prevails. If the top of the tree is destroyed, new limbs will start out and come into bearing within a few years. Covering with slat or canvas covered sheds is most common in Florida, but has never been tested in Louisiana. These sheds cost from \$600 per acre upwards, but the profit still remains large.

The development of the orange has come not only steadily, under the influence of good culture, but by leaps and jumps. The navel oranges came in about 1870, and at the outset were nothing more than chance seedlings. Whenever choice varieties appear they are grafted into the older stock. The number of varieties grown in a large Florida orchard is nearly as great as the number of apples in a New York orchard.

The owner, when showing his hospitality, always asks you which variety you prefer. There are round varieties, and there are oblong, and there are flat. The colors change from a deep saffron to a light lemon color. There are very seedy sorts and others with no seeds at all. Some of the best varieties are very small, but the flavor exquisite. In fact, the flavors vary as widely as between Bartlett pears and Anjou or Lawrence—some being very sweet, while others are piquant and spicy.

A few years ago our Washington Agricultural Department took in charge a more scientific improvement of the orange. The result has been one of the miracles of our age. Three years ago some of the seedlings produced, by a cross of the hardy trifoliata orange and the finest sweet oranges, came into bearing. Some of these proved to be sweet and eatable, altho small; while others were decidedly sour and classed very well with the lemon. Crosses with the grape fruit gave other startling results, in some cases of real value. One of these has been named the Tangelo, and points the way to a new lemon-like fruit of great importance. During the summer of 1894 still more of the seedlings came into bearing; some of them giving large fruit of the finest quality, while the trees were hardy enough to endure considerable frost. Secretary Wilson and Professor Webber, of the Pomological Division, are agreed that they have already in hand new varieties of very high quality, while the trees are hardy quite up thru the cotton belt, and probably some of them as far north as the Ohio River. This application of science to plant breeding shows that there is hardly any limit to the improvement of any of our fruits, in the way of either hardiness or quality. We may feel quite sure that oranges will, before many years, be grown thruout all the Southern States, and in all probability varieties will be developed hardy as far north as good peaches can be grown. Of course, this will greatly change the relative position of the tropical States as producers; they will be compelled to share their present interests with their Northern neighbors. Meanwhile, they are developing a totally new family of pears, and a new family

of peaches, besides a great many apples, that will do well as far South as the center of Florida.

The kumquat is a curious little orange, growing on a bush or small tree, and gaining popularity thruout Florida. I have always heard from the growers that the rind is eatable, as well as the pulp, but for my part I can get along without it. One variety of this little orange is grown in windows, and in greenhouses, at the North. I think it will make one of our most acceptable winter plants, being healthy in growth and clean of insects—while it is pronounced fruitful by most growers—altho I have not found it such in my experience. Another admirable citrus plant for window growing is the dwarf lemon, bearing enormous fruits, frequently weighing over one pound each, on trees or bushes of only 3 or 4 feet in height. The rind is thin, and the pulp of the very finest quality. The blossoms appear at all seasons, and are three times larger than orange flowers, more beautiful, and deliciously fragrant. The leaves are twice the size of lemon leaves, and are highly polished. It will grow in almost any atmosphere, altho it should be kept sponged clean of dust. A 12 inch pot is large enough for the full-grown and full-fruited tree. These lemons can be planted out of doors in Florida, and should become a very prominent feature of garden culture.

The lemon is not as hardy as the orange, and for this reason you will not find it as freely planted in either Florida or California. I find that it is occasionally grown in Central Florida. As it will do with less summer heat than is necessary to thoroly ripen and sweeten an orange, its range in California is along the coast line, where the climate is modified, both in summer and in winter, by the ocean, creating an equability not to be found in the interior valleys. The lemon which was placed in our market twenty-five years ago would find no sale at present. It was a thick-skinned affair, with barely a spoonful of juice—altho occasionally we got a better grade from Sicily. The plant breeders of California have found it necessary to grow seedlings, and from these select better sorts; they have produced some extraordinary improvements. The market is

now everywhere supplied with an American lemon, equal, if not superior, to those from the Mediterranean. California sends greatly increasing harvests to the Eastern markets, besides about 2,000 carloads that are exported. In Florida the freeze of 1894-5 nearly obliterated the lemon—altho a few damaged orchards remained, where they were shielded by protective forests. The profit is so great, however, in lemons, that groves are multiplying with considerable rapidity.

To secure a good lemon requires not only first rate culture, but a period of curing. The fruit is picked with great care and then placed in storage. The object is to obtain the very best ventilation without change of temperature or air currents. In a well constructed storage house the fruits will ripen slowly, while the skin is growing thinner and tougher. The grower has in view a fruit that will be as attractive for its beauty as for its quality. When picking, the workmen slip rings over the fruit—judging by the ring whether the lemon is ready to be plucked or not. The process of curing will decrease the size of the lemon, but the rule is that a lemon for market must be about 2½ inches in diameter. Of course, there can be no piling of fruit or any rough handling. It must be cut, and neither twisted nor broken from the tree. In this department, as in all other pomological lines, there is an ideal worked after and demanded. Huge lemons, such as were often seen in market a few years ago, are no longer to be found. I am, however, quite sure that the dwarf lemon, to which I have referred, will modify existing rules, and once more give us very large fruit.

This remarkable citrus family is not by any means exhausted, however, when we are thru with the orange and the lemon. In Florida we find that the pomelo or grape fruit is planted with a good deal more freedom, in order to meet the increasing demand in the North. It contains an acid that is believed to be of decided value for a morning tonic. Southern people generally prefer the grape fruit to the orange. It is rarely relished at first taste, but those who become accustomed to its peculiar flavor are unwilling ever to be without it. The tree

came originally from the Polynesian Islands, but it is grown now very extensively in all semi-tropical countries. I have rarely seen an orange grove in Florida that did not have more or less trees of the pomelo. The fruit is so much heavier that it pulls the limbs down; all the more because it grows in clusters. The seedlings generally produce good marketable fruits, so that there is a chance all the time for easy improvement. Sometimes as many as fifteen grow in a bunch, and for this reason the pomelo is generally known as the grape fruit. It is certainly at present one of the most profitable of the tropical fruits under culture. This, however, is no time for another exploitation of the citrus family as a money maker. Orange growing can be easily overdone, and it surely is going to be

overdone. Oranges will soon hardly pay for shipping, while grape fruit will be even cheaper. Better shipping facilities and lower rates must be furnished, yet nothing can prevent overproduction and a glut in the market. The world never saw another such exodus as followed the big freeze of '95, and it is to be hoped it will never see another such. Florida was full of adventurers, with borrowed capital and no knowledge of general farming. They would have met the disaster of a collapsed market within three years. Nature did not wait, but froze the whole peninsula solid, and ended the experiment of ignorance. Those who now go to Florida must go to make homes; and orange growing must become an incident, not a totality.

CLINTON, N. Y.

## Side Lights on Count Witte

BY SALVATORE CORTESI

[This article is the result of two months' acquaintance with Count Witte, while the writer was entrusted with a mission at the Peace Conference in Portsmouth, N. H., on behalf of the Associated Press. Events in Russia allow the publication of particulars which last August might have seemed indiscreet, but which now serve to illustrate an exceptional character and a strange situation.—EDITOR.]

“THEY insist on calling me ‘*de* Witte,’” the Russian Plenipotentiary to Portsmouth often said to me, pointing to his name in a French or American newspaper, “altho the particle *de*, or anything corresponding to it, does not exist in our language. There are some Russians, it is true, who, when they go abroad, give their name this prefix to make people understand that they belong to the nobility, but I have never done so, nor, I must say, do I like my name so written.”

This must not be taken, however, as a lack of ambition on the part of the present Premier of Russia? as he is ambitious, very ambitious, but in the healthy, noble and broad sense of the word, and not for the mean satisfaction of advertising the nobility of his family. His father, notwithstanding the legend depicting him as a rough peasant, belonged to the nobility, and thru his moth-

er Mr. Witte can boast of having imperial blood in his veins.

Altho his start in life was very humble, his intellectual gifts, his wonderful will power, and untiring energy brought him from assistant station master, at \$10 a week, in a forgotten town in the south of Russia, to be at thirty-nine years of age Minister of Finance, which, under an autocratic government, was perhaps the most important position in the Empire. The superiority which he felt, and made others feel, did not secure him friends among the courtiers and the ruling classes, while the Emperor merely tolerated him. Besides, he had committed another grave sin in the eyes of St. Petersburg society, that of marrying a Jewess, who, worse still, was divorced from her first husband, who was a Jewish banker.

In 1892, after his marriage, when Alexander III had entrusted him with

the direction of the Ministry of Finance, he called him into his study, and said:

"I then nominate you Minister of Finance. Apropos, I understand you are single."

"I beg your Majesty's pardon," said Mr. Witte, intending to correct what he supposed a mistake of the Emperor, but the Czar, without giving him time to speak, in an imperious tone, added:

"It is understood you are single."

Altho legally married, Mr. Witte has officially had no wife for the court of his master, nor did Mme. Witte ever enter the Imperial Palace until very recently, when her husband was made Count, for having saved his country from the continuation of a disastrous war, and his assistance was needed to face the revolution. To a man as proud as M. Witte the words of the Czar must have been the bitterest insult and most direct challenge, which he accepted in silence, wishing to answer with facts. Indeed, when shortly after his mother-in-law, of course a Jewess, died, he, in his full uniform of Minister of the Czar, breast covered with decorations, followed the coffin to the Hebrew cemetery and delivered a short oration.

The opinion is therefore entertained that with such a man at the head of the Government the Jewish question in Russia will eventually be definitely solved to the satisfaction of the Hebrews. I remember when at Portsmouth a commission of prominent American Jews went to present to the Muscovite Plenipotentiary a memorandum containing the desires of the Hebrew subjects of the Czar. Mr. Witte received them in the small room he occupied at the Wentworth Hotel, and kept them from nine in the evening until after midnight to discuss with him, thru the medium of M. Wilenkin, the Russian Commercial Agent in America, a Jew himself, who acted as interpreter. They all left with the feeling that they could not entrust the fate of their co-religionists in the disturbed Empire in better hands than those of Mr. Witte.

What is not so sure is that the hero of Portsmouth, as they call him, really intends to inaugurate in Russia a form of Parliamentary Government similar to that existing in all other civilized coun-

tries. On this argument I remember we had several conversations, especially on board the "Kaiser Wilhelm der Grosse," which took us to America. Mr. Witte is a bad sailor, and felt the movement of the ship, even when to the majority of people it gave no disturbance. He should therefore have kept quiet, but this was an impossibility, due to his necessity for movement and action. His colossal figure, to which the square shoulders and the high boots under his trousers gave a military air, was seen for hours walking up and down the deck, with a kind of impatience and melancholy at that restriction of space and liberty. It was during one of these walks that in discussing the internal situation of his country Mr. Witte said: "Yes, we certainly need more liberty, but also, on the part of the officials, a greater feeling of responsibility toward the people, and on the part of the people a greater feeling of their duty toward the State. We need schools to educate; we need means to develop our agriculture, to extend our commerce, to exploit our riches, some of which are unknown to the Russians themselves."

"But," I remarked, "all this seems to be difficult under the present form of Government."

"It is true," answered laconically Mr. Witte, removing from his mouth the cigaret which he constantly puffs at in an exaggeratedly long holder.

"Then why not adopt the Parliamentary system?" I asked more than anything else for the curiosity to see what he would answer. He stopped in his walk for a moment and looked me straight in the eye, exclaiming:

"The remedy might be worse than the evil! With the exception of England, just look how the Parliamentary form functions, look to what a condition it is reduced in Latin countries, look at the scandals in Austria and Germany, look at the corruption in America. In Russia it would be even worse, considering the immense vastness of our territory, the conflicting interests of such different regions, the difficulties in the way of communication, the ignorance of the people and the lack of political education in the masses."

"Then?"

"Then something will have to be done and soon, taking from Parliamentarism what is good and may respond to our needs, but rejecting what experience has already proved to be wrong in other countries. What is necessary is a purification of bureaucracy and a decentralization of the Government, so that each region can have rules and measures adapted to its requirements."

After having been one week in New York and five weeks in Portsmouth, Mr. Witte said to me that he was highly satisfied with the impression he had received in America, and that he would leave with a considerable augmentation of his knowledge in ruling men. "I only regret," he ended, "that while Americans and Russians have always been such good friends, they know each other so little. This state of things must cease. Americans must come to Russia, and they will find there a vast field for advantageous enterprise."

The move of Count Witte in calling a meeting of the editors of the Russian newspapers to help him in re-establishing order and reorganizing the new Government reminds me of the ability with which he handled the 123 journalists who hunted, haunted and hounded him at Portsmouth. Without showing his object he succeeded in alluring into his net especially the representatives of the anti-Russian press. A leading London paper, which to have an impartial report on the peace negotiations had purposely sent to America one of the most learned English writers on Russia, and its Peking correspondent, considered an authority on the Far Eastern question, had its plan checked by the ordinary American correspondent having fallen into the arms of Mr. Witte, and compiling in the room of that statesman his daily despatches, to the exclusion of whatever his two colleagues might think or write. Indeed, after a few days, having found that their presence was useless, and that they were not even allowed to know what was cabled to their paper in London, they both asked to be recalled. The correspondent of another London daily, which claims to have the largest circulation in England, was so in the hands of the Muscovite Plenipotentiary that he was even allowed at some official ceremonies

to be considered as a member of the Russian delegation. The list might go on indefinitely, but I will end it, recalling the case of the representative of a Parisian paper, which devotes a large space to foreign news, who, notwithstanding the anti-Russian attitude of his journal during the war, sent it a daily enthusiastic interview with Mr. Witte for all the four weeks of the conference.

Mr. Witte's greatest ability is certainly that of concealing his plans in order better to reach his object. Going to America with him, from what he said and what his companions added, it was evident that he had been chosen by his own adversaries, hoping that the Portsmouth Conference would be his political death. Either he would break off the negotiations, and this would prove that he was not the able man which he is supposed to be, or he would conclude peace, and no matter how mild the conditions were, they would appear in Russia so severe as to make it possible to depict him as a traitor to his country.

"You must have a plan to get over the dilemma," I remarked one day, but I noticed that he answered evasively and preferred to change the subject. On the 30th of August, the day after peace was decided, Mr. Witte sent for me and said:

"You remember when you asked about my plan? Yes, I had a plan, but I revealed it to no one except my wife when I left Cherbourg. Not even the Czar knew what my intentions were. Like all schemes destined to succeed, my plan was very simple. I set myself to work to convince every one that the continuation of the war was inevitable and that peace was impossible; I convinced President Loubet in Paris and President Roosevelt at Oyster Bay, and they both worked gallantly to render these predictions false. They could not have done more had I been in a position to command them. Contemporaneously with the reports which I sent to my Government, showing that the struggle had to continue, I suggested that all the concessions compatible with our honor and dignity should be made, as we would thus have a better moral position before the world for the continuance of the conflict. My attitude evidently succeeded in convincing Baron Komura also, as he must

on his side have urged the Japanese Government to give in for the same reason. St. Petersburg and Tokio responded so well that yesterday the only condition left was that of the war indemnity, and Japan could not send 1,000,000 men to be massacred for a mere question of money, after having obtained much more than they ever dreamed of having before the war."

What Mr. Witte did not care to explain was how he triumphed over his adversaries in Russia for the last time at

Portsmouth. It seems that they ended by having a suspicion of his plans, and the very morning of August 29th a telegram was sent to him with instructions not to conclude peace even on the conditions contained in the ultimatum of the Czar. That telegram was answered only in the afternoon, saying it had arrived too late; peace was concluded. Mr. Witte was credited with having exclaimed:

"Every one thinks I came here to fight the Japanese, while my true opponents were in Russia."

ROME, ITALY.

## San Francisco

BY HARRY H. KEMP

THE God of Magnificent Cities, who maketh a fact of a dream,  
And mountains of masses of granite to the tune of shrill whistles and steam—  
He said: "I will build me a city of temple and market and quay,  
To commerce with tropical islands and yellow hordes over the sea."  
So the clangor of sledges went tinkling to the wondering face of the sun.  
As ants scale the trunks of high cedars his masons crept on, one by one,  
Along huge skeleton scaffolds, sure footed, practiced of eye,  
And guided the long steel girders which swung thru the spaces of sky.  
And thus there was builded a city, a million spired youth, a world-mart,  
Which roared like a sea shell with noises of traffic and labor and art.

In the course of the days and the seasons the Titan of Earthquake awoke:  
The human-placed burden it irked him and weighed on his neck like a yoke;  
So merely he turneth him over with a primitive savage's mirth,  
And sendeth out smoke from his nostrils, and tosseth a handful of earth.  
And the lordly tall buildings collapsed, of the strength of their sinews beguiled.  
As a playhouse of blocks tumbles down at the blow of a petulant child.

Said the God of Magnificent Cities, the placer of granite and beam:  
"My Rome is the laughter of nations, my Carthage and Athens a dream;  
My olden Assyrian cities, and those of the Pharaohs of old,  
Are one with the kisses of Helen, are one with a tale that is told,  
The haunt of the sun loving lizard and jackal, the awe of the band  
Of wandering nomads which blunder upon them half buried in sand.  
But I will rebuild me this city and shape it to grandeur again;  
For I never have meant it for marmots, but as habitation for men."

Lo! once more the church bells, the whistles, the ships that go out thru the bay,  
With forward sweep, and the sea gulls a-wing in the wake of their way!  
And once again the hammers, the noises of traffic, the cry  
Of artisan voices, the atomlike builders who climb in the sky!

O God of Magnificent Cities, O piler of granite and beam,  
The nations are waiting and watching to see thee refashion thy dream.

LAWRENCE, KAN.

# The New San Francisco

BY FRANCIS G. NEWLANDS

[The Hon. Francis G. Newlands, United States Senator from Nevada, has for years been among the most earnest and active of the rich men of the country in every measure tending toward wise and sound development. In the great disaster to San Francisco he instantly saw the need of practical aid beyond attention to immediate suffering, and set wheels in motion to accomplish it. As a part of his plan he presented a resolution to the Senate, to which he refers in the following article.—EDITOR.]

THE recent catastrophe at San Francisco has aroused the sympathy of the country and of the entire world. Many of the nations have, thru their legislative bodies, offered relief; a spontaneous movement thruout the country has resulted in an unprecedented subscription for the immediate relief of the suffering and the destitute. The Congress of the United States has appropriated on behalf of the nation two and a half million dollars, which has been expended in food and supplies for the suffering people. There remains yet a business question to be determined, and the nation itself should, in my judgment, take part in its solution.

San Francisco is the great port of the Pacific Coast. It bears important relations, not only to the commerce between the States, but to commerce with foreign nations. It is the gateway to the Pacific. Beyond it is the Orient, with vast possibilities for American trade. Two weeks ago it was a great and prosperous city, the financial center of the Pacific Coast, absolutely independent of the financial centers of the East. From it the hand of energy and enterprise was extended to every part of the Coast, and to the intermediate mountain region beyond. It had great financial institutions whose capital was the savings of the San Francisco people, and whose loans on note and mortgage promoted the development and the improvement of the city. The forces of nature seized this great city and shook it like a rat in a trap. Nature itself contemplated no serious harm; it simply demonstrated its force by shaking the earth a little. The disaster came from the uncontrollable fire, and three-fourths of the city was swept away, including all portions devoted to banking, to wholesale

and retail business and to manufacturing. Out of nearly one-half a million of people, three hundred thousand became homeless in a night; unprotected against the elements, lacking in food and clothing.

The charitable work of the nation has been done; the business work of the nation has not yet commenced. Speedy restoration means the saving of a great city and a great port with all its proportions unimpaired; it means a better development than the accidental growth of the past; it means broad and comprehensive plans; it means the co-operation of great interests; it means an harmonious and proportionate reconstruction by methods of building which will make similar convulsions of nature harmless; it means that the existing population shall be kept there at work with courage and energy. The incomparable harbor is still there; the incomparable location of a great city is still there; the people are still there. All that is lacking to construct, as if by magic, a city stronger and more beautiful than the old San Francisco is capital. If capital is immediately supplied the population will be held there, and men of courage and energy will do the rest. If not, the people will gradually melt away and an accidental development without plan and without proportion will take place, and ten years will be required to secure the restoration that revivifying capital will accomplish within one year.

Where is the capital to come from? From the banks? The great commercial and savings banks of San Francisco have not kept their moneys in their vaults. They have loaned them out upon San Francisco real estate and to San Francisco industries. Their securities

are doubtless ample, if restoration takes place, but they furnish no basis for immediate finance. Over \$150,000,000 is due from the insurance companies of the country and of the world. The loss to them has been a sad one. They are engaged in the process of adjustment. Will they settle immediately, or will they bargain for compromises? The information comes from the press that they propose an arbitrary adjustment, assigning 40 per cent. of the loss to earthquake, which they will not pay, and 60 per cent. to the fire, when, as a matter of fact, the earthquake did not cause 3 per cent. of the loss. Can they pay immediately? Insurance companies rarely keep large amounts of money on hand to pay such losses; they must reach out for their surplus invested in securities. They may require considerable periods of time to realize the full value of such securities; they may hesitate to throw them upon the market with the consequent result upon market prices.

Can the State furnish the capital? San Francisco is the heart of the State, and when the heart is paralyzed can the body act? Meanwhile these three hundred thousand people—courageous, self-reliant, possessed of real property bound to be much more valuable in the future than in the past, are, in large part, objects of charity, supported by the benevolence of the world. Men of courage and self-reliance—grateful tho they may be—will not long endure these conditions, and if continued the property owners will be left to maintain their struggle, and the population, which gives their property value, will disappear.

In such an emergency has the nation no duty? Is San Francisco alone interested in the port of San Francisco? Is California alone interested in the port of San Francisco? Are not all the States of the Pacific Coast and all the States and Territories of the inter-mountain region interested in the maintenance of that port? Is not the whole country interested in the port which is so important a factor in commerce between the States and commerce with foreign nations? Is it not the duty of the nation to look out for the general welfare and to look out for commerce between the States and with foreign nations? In brief, is not

San Francisco national and international in the position which it occupies? Cannot the power and the strength and the capital and the credit of the nation be employed to advantage, not simply in charity, but in business work at such a juncture? Is the Government to be active only when manufacturers demand protection, and ship owners demand subsidies, and world fairs for the promotion of interstate and foreign commerce require aid and encouragement? Is the nation only to act when Cuba rises in protest against oppression and when it determines that the Filipino people, seven thousand miles away, require aid and instruction in the science of self-government? The nation gave its credit to the extent of hundreds of millions of dollars to the Pacific railroads; it has given subsidies to steamship companies; it became a partner in the St. Louis Fair, and when it was in dire stress loaned it four millions and a half of dollars upon the faith of its gate receipts. When Cuba cried out the nation expended two hundred millions of dollars in freeing her people, and when the Filipinos, seven thousand miles away, fell into our lap as the result of a war intended only to free Cuba, the nation, claiming that it had a trust to discharge to civilization, and to the Filipino people, expended three hundred millions of dollars in an effort to save them from their own disorder and to instruct them in the science of self-government and fit them for independence.

Impressed with the importance of immediate action, because a dollar of capital now will be more potential than five dollars of capital hereafter, I consulted with financiers in New York regarding a great loaning and real estate corporation for the restoration and development of San Francisco. Negotiations that were intended to be confidential got to the press, and the wire flashed to the entire country, as well as to the people of San Francisco, that an enterprise, simply hoped for, was an accomplished fact.

At such a juncture I felt that a public statement was required that the people of San Francisco should not be deceived or deluded by mistake or error; I felt that it was time for the nation to act vigorously and promptly of its own ini-

tiative, not in a charitable way, but according to business judgment, that would inspire confidence and renew energy. I, therefore, introduced in the Senate a resolution instructing the Committee on Finance of the Senate and the Committee on Ways and Means of the House to inquire into it and report as to the best and most effective method of giving national aid, with a view either to aid of a broad and comprehensive nature, by the use of its credit, which would immediately put San Francisco upon its feet, without loss, or possibility of loss, to the nation, or emergency aid of a temporary character which would facilitate reconstruction, setting the people to work and do away with the necessity of making unfavorable adjustments with the insurance companies upon terms which the companies themselves would necessarily dictate. I wished the nation to assume, unsolicited, the great responsibility that attached to it under existing conditions. I assumed the responsibility as a Senator of a sister State, intimately related to California by the ties of interest and affection. I thought that San Francisco was sufficiently engaged in the immediate and pressing conditions of the hour; I felt that the process of convening the Legislature was a slow and tedious one. The Congress of the nation was in session, far removed from the scene of disorder and distress and destruction. I felt that it was called upon to do a little thinking in such an emergency for a port which constituted an asset of the nation. The resolution simply called for an inquiry and report. I urged immediate action in the Senate.

The effort thus made with the best of intentions may fail of result. But there yet remain the great financial institutions of the country—the institutions which backed the great transcontinental railroads, the financiers who are interested in them, and the great loaning institutions of the country, whose funds are derived from every part of the country, and loaned back to the people for the promotion of enterprise. I trust that these great institutions will move, and will move powerfully and quickly in forming some corporation for the reconstruction of San Francisco. If this is done, the country will respond with a popular sub-

scription for a business enterprise involving profit in the shape of interest upon loans and upon real estate improved that will amaze the country. The people who have contributed voluntarily \$20,000,000 in charity will not hesitate to subscribe \$50,000,000 or \$100,000,000 to an enterprise that will accomplish more for the restoration of San Francisco than charity, and which will result in abundant profit.

Earthquakes mean nothing. In all the earthquakes of that coast only a few hundred people have been killed. They have meant little in the way of destruction of property, and that little loss can be entirely prevented if structures of steel and structures of reinforced concrete take the place of the accidental and insecure structures that have hitherto prevailed. A little shake in the earth's crust, resulting in a crack here and there of a few inches, constitute no real source of danger. The destructive element here was the fire. The source of water supply was twenty-five miles distant in artificial lakes, constructed for the purpose of catching the falling rains, and the flow of large watersheds, for the benefit of San Francisco. They have never realized that any other fire protection was necessary. This catastrophe will instruct them that they must have emergency plants which can take the water of the bay and of the ocean, almost entirely surrounding San Francisco, and make it useful in such emergencies. Science and the skill of man will meet every requirement of the situation and make San Francisco as safe as any city in the United States. Its property will increase in value, just as the property of Chicago has increased thru men, having faith, investing their money after the fire, where they have since realized enormous fortunes.

No one has visited San Francisco without realizing the charm of the locality, the attractiveness of its cosmopolitan population, the beauty of its location, the salubrity of its climate and the marvelous combination of beauty and of scenery—with the bay on the one side and the ocean on the other and the enduring hills between, a great and inspiring mountain system within easy view. With the aid of the architect and of the

builder a new San Francisco will arise from the ashes of the old, and this great catastrophe will be regarded in coming years as a benefit rather than as a misfortune. But shall it finally obtain, only thru the slow, uncertain accomplish-

ments of local and individual efforts, struggling thru present conditions of poverty, or shall it be a quick, complete and perfect reconstruction aided by the inspiration of abundant resources?

WASHINGTON, D. C.

## I Heard the Spirit Singing

BY JUNE E. DOWNEY

I HEARD the Spirit singing in the ancient caves of Work:  
 "You are playing, Man-child, playing where the evil demons lurk;  
 Yet I would not have you falter or count the awful cost,  
 Lest your heart grow old within you and the zest for sport be lost.

"So toss the ball of empire, with its fatal coat of fire;  
 And dig for gilded nuggets with the pangs of hot desire;  
 And blow your filmy bubbles in the bright face of the sun,  
 Tho you know they'll tarnish, vanish ere your playing-day is done.

"Go, spin your humming-top of Thought, or brood with sullen lip,  
 As you scrawl upon the canvas or load the merchant ship;  
 Come, tell some old, old story or rehearse some ancient creed,  
 Or with many a lisp of wonder draw the music from the reed.

"Let your playful hand in cunning devise a giant eye,  
 And in long hours of frolic guess the secrets of the sky;  
 Or peer with curious longing in the busy underbourn,  
 Where microscopic beings are playing in their turn.

"And raise Love's swaying ladder to the dizzy heights of woe;  
 And walk o'er desert places where the thorns and thistles grow,  
 Where the Man-child gropes and stumbles and holds his quivering breath  
 As he meets within the shadows his last playfellow, Death."

I heard the Spirit singing: "Laughter is the strongest prayer,  
 And the zest of faith is measured by the mirth that toys with care;  
 And he who plays the hardest and dares to laugh aloud  
 Beyond the cavern's shadows may some day work with God."

LARAMIE, WYOMING.

# The Study of Hebrew

AMORY H. BRADFORD, D.D.

LATELY MODERATOR OF THE CONGREGATIONAL NATIONAL COUNCIL.

THE theological seminaries have made, and are making, an idol of the Hebrew language. They are responsible for the waste of an enormous amount of precious time, and are offering only a shadow in compensation. They are ignoring the fact that almost, if not quite, the entire Hebrew literature has already been translated in a way which will never be surpassed, until we have a more perfect text, which it is probable we shall never have. Most ministers of the present, and the past, know next to nothing of the Hebrew language. They would not use it if they knew it; and most do not hesitate to say that the time which they have spent in their endeavor to master it has been time which might have been better employed on other subjects. What arguments are advanced in favor of making the study of Hebrew a condition to a degree in most of our theological seminaries?

(1) "It honors the Bible." This was the reply given to me by the president of one of the most prominent theological seminaries in the United States. But how it honors the Bible more than an exhaustive study of the English Bible would do, he did not indicate. He was mistaken. At the outset let me qualify my statements by the frank admission that the seminaries should make full provision for the study of Hebrew by those who desire to pursue it. I am speaking of it as a condition to a degree. How has the Bible been honored by the slipshod way in which the subject is necessarily pursued by most students? Not one in a hundred of those who are faithful in their work, at the end of the seminary course, could get as accurate an idea of the meaning of a book in the Bible from trying to read it in the original, as from a thoro study of it in the various English versions accessible to all. Wasting time is not "honoring the Bible." A far better way "to honor the Bible" would be to insist that no student should be received in any theological

seminary until he had passed a thoro examination in the whole Old Testament in English, and no one allowed to graduate until he is master of the contents of the entire Bible. Every theological student should be required to know, as most do not, the contents of the English Bible from cover to cover, and all about it that can be learned within the limits of their course. That would be honoring the Bible; but the study of it, as it is of necessity pursued in most of the theological seminaries, is only preparatory to its being forgotten, and dishonors the Book. Let it be honored, but let it be in a rational, practical and helpful way.

(2) "The study is needed as an intellectual exercise." To this the reply is that the selection of studies for the sake of discipline belongs to the college and not to the professional school. Moreover, philosophy, sociology, history, and German are equally valuable for disciplinary purposes, and of far greater value for the work of the minister.

(3) "The study of Hebrew is necessary in order that the Christian teacher may be properly equipped as an interpreter of the Book."

I have already granted that the theological professor in the department of the Old Testament should know Hebrew; but I insist that the time spent in linguistic drill, if devoted to studying the well-nigh perfect translations already in existence, would give to ninety-nine men in a hundred a truer understanding of the word of God than they could otherwise get, and, therefore, would better equip them to be interpreters of the word.

I hope I shall not seem irreverent when I say that the compulsory attention given to Hebrew in our seminaries is a relic of medieval days. I cannot think of a single rational argument which can be used in its favor. On the other hand much can be said against it. Let me qualify what I shall say by insisting again that provision should be made for all who are especially called to such

studies. I do not minimize the work done in this country by such men as Green, Harper and George F. Moore, by Briggs and Francis Brown, and in Great Britain by Robertson Smith and George Adam Smith. No teachers ever performed a better service for the Kingdom of God, and it should not be made impossible for them to have adequate successors.

That the Bible is dishonored and the ministry more or less crippled by making Hebrew a required study, is evident from the following facts:

1. The average man can get a better knowledge of the contents and meaning of the Scriptures from translations than from such study of Hebrew as it is possible for him to secure, without making it a life study, which no modern preacher can do without neglecting more important subjects. I once heard Emerson, say what has since been published, that he would as soon think of swimming the Charles River whenever he went from Cambridge to Boston as of trying to read the ancient classics in the original. What Emerson said concerning the Greek and Latin authors applies still more emphatically to the Hebrew. Men who do not know a language, both sympathetically and technically, should not be allowed to palm off on others their weak attempts at translation and interpretation as the truth. The scholars who prepared the Revised Version, working together for years, would be far more likely to prepare an accurate translation of Job or Amos than any theolog could after studying the language in a cursory way for but three years. The men who use faithfully the versions now in existence will come nearer to accuracy than those can who study the Bible in the original, but whose knowledge is limited and individual.

2. The time spent in studying Hebrew would be far more profitably spent in the study of other more important subjects. In these days many subjects are more important than Hebrew; e. g., philosophy, sociology, history, comparative religion and German. These branches are pursued more or less in the universities, but none of them as thoroly as they should be. German is needed to open the door to the most abundant literature

in theology; philosophy is needed to enable the preacher to cope with the various modern fads like Occultism, Christian Science and all those forms of doubt that have their origin in exaggerated mysticism; history is needed in order that the present may be seen in its proper proportions and relations; comparative religion should be studied, as essential in a missionary age. I have left sociology to the last, because the importance of a thoro knowledge of human society, of the relation of man to man, of the claims of the organism on the individual, and the duty of the individual to the organism cannot be exaggerated. These subjects, if treated at all in the colleges, are studied in a subordinate way. Few, if any of them, are allotted as much time as Hebrew, but all of them are vastly more essential to the preparation of a minister for his work. To those studies already named may be added Christian ethics, which has a place in most seminaries, but in none of them has the attention which the subject deserves. Because there are at least six subjects of vastly more importance to a successful ministry than Hebrew, and because they are inadequately treated in our theological seminaries, I would make a larger place for them by removing Hebrew from the list of subjects required for a diploma.

3. This article is not a plea for a less scholarly ministry. On the other hand, the ministry should be more scholarly. It is rather a plea for a change of emphasis in the preparation required for the preacher's work. The emphasis has been largely on the dead languages. It is difficult in these days to find men equipped for the Chair of Systematic Theology, because so much attention has been given to the exegetical departments—and especially to the Old Testament. The theological chair should be of supreme importance. It has been made relatively subordinate. No doubt a smattering of the subjects already named may be secured in most divinity schools, but the work along these lines is not what it should be. Philosophy, sociology, comparative religion and ethics should be given scholarly attention. Men who are ignorant of these subjects should not be sent out to teach

in the churches. A knowledge of life, both social and individual, is essential to a wise and useful service of humanity, and especially to a teaching ministry. As the first step in the direction of the broader scholarship so imperatively needed, let Hebrew be removed from the list of required to the list of optional studies; and then let those studies which have to do with the problems of life and

society, in their modern conditions and relations, be given a large place in the curricula of schools for the preparation of ministers for their work. Thus the Bible will be worthily honored, a great deal of precious time will be saved, and the energies of students will be turned toward subjects which the age imperatively demands.

MONTCLAIR, N. J.

## The Provincialism of New York

BY SYDNEY BROOKS

[Our readers will remember Mr. Brooks's past contributions to our columns on English topics. As Mr. Brooks is now considered one of the European authorities on America, the following article should prove of peculiar interest to the whole country. He has just come back to the United States after a six years' absence, to get into personal touch again with the new men and measures that have come up since he was here last.—EDITOR.]

COMING back to New York after a six years' absence I find everything in and around it changed except New York itself. The essentials of New York existence strike me as being pretty much as they were; its spirit has not altered; its instinctive way of looking at things is still the same; accessories have been multiplied, subways excavated and old landmarks overlaid by Titanic skyscrapers—I can never quite rid myself of the idea that Euclid and the Titans and Mr. Edison are the real builders of New York—but the *genius loci*, the "note" of the place, its peculiar characteristics, its distinctive social flavoring, its unique perspective, all remain as I recall them on our first acquaintance ten momentous years ago. That "note," if an Englishman may venture an opinion on such a subject without excessive impertinence, I take to be one of grandiose provincialism. Americans will dispute this; most of my own countrymen would probably dispute it. By Americans New York, I believe, is constantly spoken of as the most, if not the only, cosmopolitan city on the American continent. And in one sense they are right. It is the fact that on

Manhattan Island an extraordinary number of people of diverse races, speech and nationalities do contrive to live side by side without too much friction and that the resultant blend is something not quite American and not quite European. But true cosmopolitanism is not a matter of counting heads. If it were, if all that is needed to make a city cosmopolitan is the gathering together within its boundaries of men of all races, then we should have Chicago putting in a claim to the title. True cosmopolitanism, of course, has nothing to do with numbers or nationalities. It is a mellow something in the social air. It is the pervasiveness of the spirit of tolerance, easy-goingness and wide and quiet intellectual interests. But that surely is not the spirit of New York, where life is feverish, where nothing is taken for granted, where trifles assume an inordinate importance, where one grows almost bored by the city's incapacity to be bored, and where the social code has scarcely that spaciousness and experience one associates with cosmopolitanism.

But if I cannot bring myself to subscribe altogether to the American view of New York, neither can I endorse

without some reservations the British view. The British view, roughly speaking, is that New York is America. It is quite in accordance with this notion that almost all the American correspondents of English newspapers should be stationed in New York. I have heard London editors declare that in normal times Englishmen will not read American telegrams unless they bear the postmark of New York, and I have constantly come across an impression that the great city on Manhattan Island plays in American life and politics very much the part that London, Rome, Berlin and Paris play in the life and politics of their respective countries. That seems to me an almost entire delusion. In many ways I should judge that New York is the one locality of all others that most misrepresents America. Indeed among the many fertile causes of Anglo-American misunderstandings I have always given the first place to the fact that Englishmen never look beyond New York and the second to the fact that New York never looks beyond the Palisades. The eyes of New York, when they are not turned inwards, are turned eastwards. Of its own hinterland it seems to me to be as ignorant as the average Englishman is of Scotland, and not only ignorant, but superciliously indifferent. It takes up toward the West that attitude of "monocular insolence" which I remember hearing a clever American pro-Boer describe as the characteristic of Mr. Chamberlain's diplomacy; and the West in return despises it as a colorless reproduction of the luxury and fashions of "effete" Europe, resents the social superiority which it is forced to admit, and at times hates it as the throne of the "money power." The notion that the West looks to New York for political guidance or waits upon its lead in any public question, tho very common among Englishmen, is, I believe, wholly erroneous. Personally, I confess that I never really feel myself in America until New York is left behind and one is free of its atmosphere of concentrated self-sufficiency. The city is really a little world to and in itself; a world planted round a backwater, away from the main streams, both of European and of American life, but more closely allied in sym-

pathies and tastes with London and Paris than with Chicago or Denver. To look for a city that will in any way sum up the vast heterogeneousness of the American continent is, of course, only less absurd than to look for the adjective that will perform the same office; but were such a competition to be instituted I imagine that New York, with its intense absorption in its own affairs and its cool disdain for everything in America that is not New York, would find itself hopelessly outdistanced. As a watch-tower from which to spy out on the picturesque pageant of Europe I find the city admirable. As a point of perspective on the thoughts and movements of America I find it useless.

Yet New York is a great power. Commercially, financially and politically its influence decreases automatically with the upbuilding of the West. I doubt whether it will ever again be as great as it was in the Presidential election of 1896, when the city led the fight against Bryanism; and fifty years hence it may quite conceivably be in the position of a firm whose branches have overshadowed its central and original office. But socially and esthetically it will long remain, as it is now, supreme and unrivalled. The ten days that Prince Louis of Battenberg spent in New York made, I should say, a greater impression on America than would have been made by a stay of ten months at any other seaport on the Atlantic or Pacific coasts. It is on such occasions that New York makes good her claim to be considered the real metropolis of America. Prince Louis's visit was a mere incident so long as it was confined to Washington, Baltimore and Annapolis. It only became a national event when he reached New York. There were some accidental reasons, no doubt, to account for this, but the grand reason was that nothing in a social way really interests the United States that has not first of all interested New York. When New York has decided whether sleeves are to be close fitting or full and waistcoats to be cut high or low, all America rushes to accept its judgment and scatter it broadcast. And I am inclined to think that the verdict of New York on a book or a play is worth several times more than

the verdict of any other city in the Union—to the publisher and the theatrical manager, if not always to the critic. On points of social usage and etiquette the dwellers on Fifth Avenue are, I suppose, the final and absolute court of appeal for the entire commonwealth; and as the home of the growing American leisured class, the rendezvous of all the famous "magnates" and millionaires in the country, the birthplace of Tammany and the center of pleasure, New York exercises an irresistible attraction over the imagination of the whole Republic. I admit all this and much else. I admit the attractiveness from more than one aspect of its social atmosphere. I admit that the relative decline of its commercial, financial and political power, tho, in my judgment, inevitable, has yet barely begun to be discernible. But I still maintain that the intensity of its location, and its palpable incompleteness as a representative condensation of America, combine to make it an essentially provincial city; and to place it in an isolation of which I should not be surprised to hear that an American was even more conscious than a European.

But let no New Yorker take offense at what I have written. Every metropolis is provincial, and New York is neither more nor less fallacious as an index to America than are London, Paris, Berlin, Vienna and Rome as indices to their own countries. But it is fallacious in a different way, and I am not sure that from some points of view the difference is not in its favor. It can never, of course, be to America all that London is to England. But, then, what is London to England? It is not, I need scarcely say, the determining influence in English politics that Paris has often been in French politics. London is altogether too languid, too social, and too sociable to be a keen politician. There is no city in which it is so hard to start a "movement." Its political opinions, nine times out of ten, are the opinions of clubland and the West End. I doubt, indeed, whether it would be possible to point to a single political movement of real consequence and say: "This had its birth in London" or "But for London and the power and support of London

this would never have succeeded." The city is too big for one thing and too much dependent on society for another to have either the concentration or the energy which is necessary for political leadership. Birmingham and Manchester have each in turn set the country in a blaze, but London originates nothing and discounts everything. Almost all the qualities that make it so unique and enjoyable socially—its superb tolerance, its thoroughly comfortable outlook on life, its "nothing too much"—tell heavily against its political success. Even to its own affairs it is magnificently indifferent. It has no civic consciousness or sense of a corporate life or local pride. The most famous and splendid of English cities, it is also the worst governed. In all this Paris, and not Paris alone, is its obvious antithesis. In spite of everything Paris, at any crisis, is still the leader of France, and at all times wields over her a political influence far more complete, more active and more acknowledged than London even pretends to. It is only in war time, at moments of the utmost national emergency, when the energy of the country in all other political directions is suspended, that London becomes synonymous with England; and it is only then that the London press can be taken as accurately reflecting the opinions of England.

But if we leave politics aside—and even in politics London more than makes up indirectly and thru the channels of society for what she loses or at all events misses on the public platform—and consider the other attributes that go to the making of a genuine capital, the contrast between London and New York becomes yet more pronounced. In art, the drama, letters, society, and intellectual influence generally, London not only dominates, but tyrannizes over England. Every Englishman who acts or writes or paints turns toward London as instinctively as Daudet turned toward Paris. In music, too, it is just the same. I remember reading a few years ago an article by the ablest of the very able group of English composers who are winning their way to national and even to European recognition. The writer argued that without decentralization English music could never put forth its best. He pointed out

that London is the only city in the kingdom where the higher kinds of symphonic and operatic music can be persistently cultivated on a large scale; and he very justly insisted that one of the seminal factors in the development of German music was the opportunity open to a musician of traveling round a dozen little States and little capitals, each with its own orchestra and opera. Nothing of the kind is possible in England. London drains England of its music just as it drains it of everything else. It would, indeed, be difficult to name any Englishman who has achieved distinction in any department of activity, except that of trade, who does not either live in London or is not constantly to be met with at the clubs or in society. Practically all the creative and all the critical power of the country is heaped together in that one city; so that the opening of the London season is really an event that is national in its sweep. It is New York plus Washington, plus Boston—and with no Chicago on the fringe.

That is all very well, but it is an open question whether a country really gains by having a capital of this comprehensive and all-absorbing kind. Mr. Bryce, in his "American Commonwealth," declares that one of the most interesting experiments of the United States is the unconscious effort that is being made to offset the absence of a real capital by the multiplication all over the country of smaller centers of light and leading. Which system will produce the best intellectual results he thinks it too early to determine. In politics, he argues, America has lost something in having no city of undisputed primacy to look to, even while she has gained much in escaping thereby the pernicious influence of "society" on the national legislature. But he hesitates to prophesy whether the "dispersed geniuses" of the United States will be able to accomplish more or less than the concentrated geniuses of Paris

or London. Goethe, who lived when German sectionalism was at its worst, penned an admiringly envious panegyric of Paris, "where the highest talents of a great kingdom are all assembled in a single spot, and by daily intercourse, strife, and emulation, mutually instruct and advance each other." As much might truthfully be said of London. It virtually monopolizes all that is best having in English life. On the other hand, it inevitably leaves the rest of the country somewhat barren; and it is just there, as it seems to me, that an American might find his consolation for the incompleteness and provincialism of New York. Journeying thru the English provinces, or staying for some time in an English provincial town, one detects a degree of intellectual stagnation such as no part of America quite sinks to. I cannot doubt that that is partially due to the reflex action of the exhausting preponderance of London. In America, on the other hand, there is no section of the country, or at all events no fairly populous section, that is not alert and curious to know and learn or that lacks the quickening salt of intellectual breeziness, stimulus and exhilaration. It may not always work with the best effect, but is there just the same; and it is at the root of American success that it should be there. It generates among the cities and sections of the country a rivalry that bears fruit, not only in magnificent universities, museums, galleries and all the accessories of a polished civilization, but also in a spirit of local patriotism comparable to the feeling of an Athenian for Athens. That is a feeling it would be difficult to plant and foster in the shadow of the magnetic and acknowledged superiority of an American London. The inadequacies, the provincialism, the incompleteness of New York have, therefore, their compensation. They give the rest of the country a chance.

NEW YORK CITY.

## Mental and Moral Heredity in Royalty \*

WITHIN the last decade there have been several investigations attempting to apply exact quantitative treatment to such complex qualities as general intellect, achievement in science, artistic ability, eminence in the world's opinion and the like. The studies reported by Dr. Woods in this volume are, tho not the most refined in their methods, the most interesting to non-technical readers. For the influence of heredity as a determinant of the intellect and character of any human being interests every thoughtful man; and the use of royal families as illustrations and measures of its power adds a marked historical import and also a certain picturesqueness to the general theoretical problem. Heredity as the source of Emperor William's intellectual superiority to the other present kings of Europe is naturally a more captivating topic than heredity as the cause of the spelling ability of Mary Jones.

Dr. Woods graded some six hundred individuals on a scale of intellect from 1 to 10, in consideration of the information obtained from a heroic perusal of biographical dictionaries, archives, histories and court memoirs. His grades rest on two suppositions; first, that such common judgments as that Frederick the Great was an abler man than George III represent a real, tho, of course, possibly totally wrong, assignment of the two men to positions on a scale of capability, and, second, that individual differences in intellect are of approximately the same distribution as we find for individual differences in height, power of vision, accuracy of movement and the like. So also with his grades for morality. Given such grades as approximately true measures of intellect and morality and the answer to the general problem of heredity is a matter of arithmetic.

Dr. Woods convinces himself and will go far toward convincing all impar-

tial readers that heredity far outweighs training and infinitely outweighs luck and miracle as the cause of the relative capacities of men by such facts and inferences as the following:

Heredity is amply sufficient as a cause in the great majority of cases.

Eldest sons, who inherit the great opportunities of sovereignty, do not show higher ability than younger sons of the same stock.

There is a clear, tho, of course, not a close, resemblance in intellect between a man and his maternal greatgrandparent.

Resemblance in morality to the maternal grandfather is as close as to the paternal.

Likenesses and differences of intellect and character correlate far more closely with connection by birth than with likeness in education.

Selecting a wife from a poor stock outweighs the utmost care in the rearing of children.

There will be certain objections made by specialists to both the methods of measurement and the inferences of Dr. Woods. For instance, some of his gradings of individuals will seem incorrect to historians possessed of expert knowledge; and to many students of heredity his assumption that inheritance is alternate, the offspring resembling one parent or the other, not a half way condition between the two, will seem not to be adequately supported. But every one should admire his zeal and fairmindedness and appreciate the importance of the investigation.

## German and American Universities

AN important factor in the imposing greatness of Germany at the beginning of the twentieth century has been its university system. Every educated American has at least a piecemeal knowledge of the subject, but now we have by a professor of philosophy in the University of Berlin an all-round presentation of the most satisfying completeness—historical, descriptive, practical. The German uni-

\* MENTAL AND MORAL HEREDITY IN ROYALTY. By Frederick Adams Woods, M.D. New York: Henry Holt. Pp. viii+312.

versity is surveyed from every side—compared with the universities of other countries, with its old self in former ages, its relation to German national life, the instructors and their instruction, the students and their studying, and lastly the separate faculties as they prepare students for four professions.<sup>1</sup> Altho his exposition of present conditions leaves no feature neglected, what interests him most in the present book is the practical aspect, the bearings of each feature of the university. Conditions call into existence circumstances, attendant effects, and it is in the exposition and discussion of this surrounding territory, these suburbs of the university, so to speak, no longer the constitution in the book of statutes, but the constitution as it works upon and is worked upon by life, that our author is, if possible, more valuable and interesting than elsewhere. And he always tries to suggest, if not a remedy, at least a palliative for those inevitable evils which are the shadows cast by virtues which may be curtailed, but cannot be avoided, except by not creating the virtues they attend. For example: what most distinguishes the German university is that at the beginning of the nineteenth century to its function of teaching that of research or investigation was added, the invasion and conquest of the universe by the human mind. Research was carried on in other countries, but it was not the business of the universities—in France by academies; in England it was a private affair. This march of knowledge became not only the function, but the governing principle of the German universities in all the faculties, but most of all in the philosophical faculty. But the faculties continued to perform their old function of preparing students for professions. As the conquest of the universe by the mind of man absorbed more and more of the interest and ambition of the professors, a rift began to open between the gymnasium and the university till it is now a gulf. Most of the gymnasium scholars fall into this gulf in passing over to the university, and many of these never succeed in climbing up on the other side. When they become

university students they are bewildered by lectures addressed not to apprentices but to masters in science.

To mention in closing two or three details at random: Americans who are old German students will be interested to learn of the immense increase in annual appropriations by the state for the growing needs of the universities; that seminars are now provided with apartments and libraries of their own; that fraternities have club houses; that the old pleasing relation between professor and student threatens to become a thing of the past, part of the price Germany has had to pay for the honor of having worldly greatness as the husband of her daughter, mental greatness. To wit, the German professor is taking to luxury and fashion, or if that be offensive, let us say that many have become men of the world as well as men of science.

A generation ago the idea that what constituted a nineteenth century university was the march of knowledge rather than teaching was concrete only in Germany among the great countries of the world. In 1876 the Johns Hopkins University began its career, and now what a change! We have some dozen institutions embodying more or less the nineteenth century principle introduced by Germany. What hives of scientific production are, for instance, Chicago and Columbia! It was the example of the Johns Hopkins that wrought this change, and the Johns Hopkins is the creation of Mr. Gilman. In the eyes of those patriots for whom idealism is an indispensable national possession it means simply caring for the things of the mind. Daniel Gilman will always mean the name of one of the chief benefactors of their country. In his book<sup>2</sup> we have the man, much as reticence marks his account of the founding of the Johns Hopkins University. With such a style no wonder that he is the favorite orator for university occasions all over the country. Cicero would have given his approval to this book. It shines with the quality he was always insisting upon—that style should be *copiosus*. The sentences are not long, but they

<sup>1</sup> THE GERMAN UNIVERSITIES AND UNIVERSITY STUDY. By Friedrich Paulsen. Translated by Frank Thilly and W. W. Erlang. New York: Charles Scribner's Sons. \$3.00.

<sup>2</sup> THE LAUNCHING OF A UNIVERSITY AND OTHER PAPERS. By Daniel Coit Gilman. New York: Dodd, Mead & Co. \$2.50.

seem long lines of undulation, swarming with gleams of thought and illustration, graceful with a flow of abundant and apt expression.

## Lincoln the Master

DESPITE all that has been written of Lincoln, the many-sidedness of the man still gives opportunity for fresh treatment of particular phases of his character. Mr. Rothschild<sup>1</sup> considers him from the single standpoint of his control of men. It was a rare, almost a unique power, which he wielded among his fellows from his earliest to his latest days; and it is here pictured in captivating manner and with a thoro grasp of the subject-matter. Perhaps too much space has sometimes been given to trivial incidents and to third-hand testimony; and yet, since this is a treatment of personality, and since such testimony may often be quite as true to life and even as accurate in point of fact, as that recorded at first hand, the indulgence can hardly be censured. All the details have been studied, and have been handled with skill and judgment; and the result is a picture that both charms and convinces.

The earlier life, with its record of a constant surmounting of difficulties and a constant growth in moral and mental stature, is given in three chapters of absorbing interest. But it is, of course, to the later epoch—the four years in Washington—that one turns for the real proof of Lincoln's masterfulness. Here he had to deal, not with the rough contestants of the frontier, but with schooled and trained leaders in politics and statecraft. Yet the power which he had developed in his early struggles was one which withstood transplanting to higher planes; and the story of his relations with the great ones of the East is but a repetition, in new forms, of that of his relations with the less developed men of the frontier. In chapters on Seward, Chase, Stanton, Fremont and McClellan, the author makes clear this innate genius for control, by which its possessor, though often seeming to be led, was himself, at all times, leader and ruler.

Perhaps there is not much that is new

in all this; but at least it is brought out with a clearness that has not been achieved before. Doubtless there are still persons who believe that Seward was the general power behind the throne; that Stanton was the autocrat of the War office; that Chase, in his own department, was another independent autocrat; and that the President was merely one who, though something of a peacemaker among the striving factions, contented himself with being a nominal head, permitting his subordinates to rule in his stead. Such persons will do well to read with care and with open-mindedness the instructive and entertaining chapters on these Cabinet officers. Others, who still retain something of the feeling once more common, that McClellan was a persecuted man, baffled by his civil superiors, will need to peruse with equal care and openness of mind the judicially framed chapter on "The Young Napoleon." The last word will probably never be spoken in the controversy over that brilliant but irresolute and ineffective soldier. No matter what is shown to his discredit, he will always command a certain romantic interest. But it is hardly too much to say that the consensus of discerning persons will, in the long run, fix upon him a judgment in the main according with that given in this book.

A new edition of the Nicolay and Hay collection of Lincoln's writings and speeches<sup>2</sup> contains a quantity of material discovered since the appearance of the edition of 1894. Most of this has been previously published, in one place or another; Miss Tarbell having unearthed and printed a considerable part of it, but it has not before been gathered with the older material into a complete collection. The Rebecca letters, leading up to the duel with Shields; some of the early poems, numbers of Presidential letters, some of them to Halleck, Meade and McClellan, as well as to Seward and other Cabinet officers, and a great mass of war-time telegrams, are included. A commendable work has been done in collecting these thousands of scattered bits. The edition will appear in 12 large volumes, of which four are now ready.

## Ancient Records of Egypt

It is time that such a work as this\* by Professor Breasted were provided. For the first time in any language we shall have a complete *corpus*, in translation, of the hieroglyphic sources of Egyptian history. In the "Records of the Past" something of the sort was begun, but the translations were by different scholars, each following his own fashion, and the texts mixed in a haphazard way, and Egyptian and Assyrian included together. Fragmentary and far from complete, that collection, in its two series, was of value, and not least because it showed what was imperatively needed. In the region of Assyriology Menant had many years ago showed us what was needed, in a single stout volume which gathered all the historical material known at the time from the Cuneiform texts; and the later "*Keilinschriftliche Bibliothek*" of Schrader, with its successive volumes of texts, more carefully translated by several German scholars, may have been an example to Professor Breasted, for it attempts to cover the complete historical records of Babylonia and Assyria, and also the religious texts. We observe that Professor Breasted intimates that when the four volumes of this series are issued he will prepare other volumes of the religious texts of Egypt.

The present series begins with the earliest known records of the First Dynasty, and will close with the Persian conquest of Egypt 525 B. C. Those earliest records, including the Pyramid period, are of great interest, altho very scanty. It is only of late that their chronology has come to be very nearly fixed by the study of the Sothis periods. There must have been a considerable culture before Menes, for the calender was introduced about 4240 B. C., while the accession of Menes, the first king of the First Dynasty, was about 3400 B. C. This corresponds, probably, with the earlier historical period in Chaldea. It is of no little interest to learn that

Snefru, a king of the Third Dynasty, about 2900 B. C., which was about the time, perhaps, of the Elder Sargon of Agade, sent a fleet of forty ships which brought cedar wood from Lebanon. But before this time cedar wood was brought from those or neighboring mountains to Chaldea. The first record of an invasion of Palestine from Egypt is by Pepi I, of the Sixth Dynasty, about 2600 B. C., several hundred years before Abraham and Hammurabi.

For these volumes the interest culminates in the Eighteenth Dynasty, when Egypt conquered Asia as far as the Euphrates, and then lost her empire under Ikhнатon, the heretic king, who is the most interesting character in all Egyptian history. It was he who endeavored to abolish polytheism, and to substitute for it the worship of the one God Aton, very likely the Hebrew *Adôn*, Lord, under the form of the disk of the sun. A hymn to Aton is thus translated by Professor Breasted:

"Thy setting is beautiful, O living Aton, ruler of the Two Hands. The people are rejoicing before thee, giving praise to him who formed them, doing obeisance to him who created them. . . . The whole land, every country in thy circuit, at thy appearance shall make jubilee to thy rising and to thy setting likewise, O God, living in truth before thy eyes. Thou art the maker of that which is not, the maker of all these things that come forth from thy mouth."

It is no part of the work of Professor Breasted to translate the abundant material for this reign found in the Amarna tablets — that belongs to Schrader's "Bibliothek"; but the Egyptian sources have been most carefully collected and often collated, and freshly translated. Our author is one of a company of scholars at work on a great Berlin dictionary of Egyptia, which has made it his duty for a number of years to spend much of his time copying and revising texts. It is very fortunate that so competent a scholar has had the courage to undertake this task, and it is to the honor of the University of Chicago that this is being so admirably accomplished. America is not being behind in large attempts of this sort, and with this may be compared the great series of Sanskrit texts being issued by Professor Lanman, of Harvard. This is not the only great work in Oriental philology which comes

\* ANCIENT RECORDS OF EGYPT. From the Earliest Times to the Persian Conquest, collected, edited and translated, with commentary, by James Henry Breasted, Ph.D., Professor of Egyptology and Ancient History in the University of Chicago. Vol. I, From the First to the Seventeenth Dynasties. Vol. II, The Eighteenth Dynasty. 800 pp., xlii, 344; xxviii, 428. University of Chicago Press. \$3.00 each.

from the University of Chicago. We may mention Professor Harper's "Ham-murabi" and Dr. Muss-Arnolt's Assyrian Dictionary. The two remaining volumes are promised by July 1st, to be accompanied by a full index. They will be of use not only for professed Egyptologists and Assyriologists, but for all students of early history, and will belong to any well equipped library. They are issued in the attractive style of the publications of the University, and are a part of the monument of President Harper, as well as an honor to the scholarship of the author.

**Church Hymns and Tunes.** Edited by the Rev. Herbert B. Turner, D.D., and William F. Biddle. New York: A. S. Barnes & Co. \$1.75.

The editors of this hymnal have sought to bring together hymns of lyric quality suited to modern use in sufficient number to form a book of reasonable size; their aim being to retain the best of the old, while including much that is valuable in later and less known verse and music. The book contains six hundred and forty-four hymns and five hundred and fifty tunes, being one hundred and two more hymns and eighty more tunes than in "Hymns of Worship and Service," the Century Company's new hymnal. A somewhat large proportion of the hymns are translations from the Greek, Latin, German, etc. It is pleasant to sing, tho in another tongue, devout songs of former centuries, but, except in paraphrases such as Neale's or Palmer's, translated hymns are usually too labored and too long for church use. Of the seventy here introduced, nineteen are the work of Neale. The reviewer cannot help questioning whether dignity of diction and content of thought are necessarily abridged with the increase of the lyrical quality in modern songs of praise or worship. One striking characteristic of later hymns is repetition. The proportion in this book of hymns, with the first or last line identical in each stanza, is remarkable. Fully one hundred and thirty-five of them, mostly quite modern, are of this repetitious sort. When opening lines are not identical they often vary in this fashion:

|                 |   |                                  |              |
|-----------------|---|----------------------------------|--------------|
| Come unto me ye | { | weary<br>wanderers,<br>fainting, |              |
| There's no      | { | night<br>sin<br>death            | { in heaven. |

|                              |   |                         |
|------------------------------|---|-------------------------|
| O grant us light that we may | { | know.<br>see,<br>learn, |
|------------------------------|---|-------------------------|

This easy fashion of hymn making, tho not unknown to earlier writers (e. g., Grigg's "Ashamed of Jesus"), was comparatively rare in church service, tho common enough in Sunday school song, until the irruption of Bonar into the "Sabbath Hymn Book" in 1858, with thirty-seven hymns, many of them valuable, but more than half of them of this flowing, catchysort. Of the twenty-one by Bonar included in the volume under consideration, thirteen at least are similar in style. Miss Havergal, twelve of whose hymns are here introduced, is another prolific writer of the same kind of devotional verse. Had she been willing to edit, revise and prune her metrical work, instead of considering it a special gift of God, springing from her brain (like Minerva full armed from the head of Jove), in God-given dress with which she dared not meddle, her contribution to English hymnody would have been far more valuable. In this work a more sparing hand might, perhaps, have been used with advantage when culling from the treasures of modern religious verse. Here we find as many hymns by Havergal as by Doddridge; more by Bonar and by Neale taken together than by Watts; as many by Bishop Wordsworth as by Bishop Heber. The Rev. Samuel Longfellow wrote good, but not pre-eminent, hymns; and Charlotte Elliott and H. F. Lyte made valuable additions to our hymnology, but none of these have equal claim to recognition with John Newton; yet Longfellow, Lyte, Elliott, Ellerton and Newton supply to this collection ten poems each. The eight by Thring can hardly balance Kelly's equal number, nor are Cowper's five overbalanced by Faber's, How's or Monsell's larger number, nor are Addison's two outweighed by Tutti's four. These comparisons are made, not to find fault with these selections, which, in the main, are good as to both words and music, but to emphasize the necessity of be-

ing far more stringent in sifting out the new than the old. The old has borne the test of time, but the new is often swept into favor, in spite of its light and ephemeral character, by some popular melody to which it has been set. It is "to immortal verse" that we would have our sacred music "wedded."

This work is exceptionally rich in indexes, and is arranged topically for the pastor's convenience. The index of authors and that of composers which are found at the end of the book have been compiled with special care.

### Literary Notes

CAREFUL cooks and housewives are now on the watch for adulterated food, but they do not usually know how to detect it. Many tests can, of course, only be made by a skilled chemist with a well equipped laboratory, but most of the common adulterants, artificial colors and preservatives may be detected in the ordinary kitchen with the aid of a few cheap reagents. The Bureau of Chemistry of the Department of Agriculture, Washington, has just published in Bulletin No. 100 a very fair and non-sensational statement of the extent and character of food adulteration, describing tests which can be applied by any intelligent person.

....The complete edition of *Franklin's Works*, edited by Albert Henry Smyth for Macmillans, has reached the sixth volume, and will in a few months round out the full number of ten. It would be easy to quarrel with Mr. Smyth for the scantiness and rather vague purpose of his notes. There is nothing to indicate to what extent and in what editions the letters have already been printed; and the general information given here and there in footnotes is of the most meager and haphazard sort. But in other and more essential respects this edition deserves the highest praise. It is far more complete than any hitherto published; it for the first time reproduces an authentic, ungarbled text, and its general make-up is decidedly attractive.

....*The Cumulative Book Review Digest*, published by H. W. Wilson Co., Minneapolis, is not only useful as a book buyers' guide, but is very interesting reading. It contains abstracts of all the reviews of books published by the important periodicals of the United States and England, and it is both amusing and instructive to see how closely the critics agree on some books and how widely they differ on others. One very popular periodical which our readers could doubtless name, altho we shall not, praises almost every book it receives. Another equally well known periodical, but not so popular, condemns all books with equal impartiality. THE INDEPENDENT reviews as a class seem to fall between these extremes, being neither so flattering as to raise

false hopes in the book-buyer, nor so condemnatory as to drive the author to strong drink.

### Pebbles

If you think you have great strength of character, try to stop talking too much.—*Atchison Globe*.

HE LOVED HER NOT.—A little six year old girl friend of mine came running to me and threw herself into my arms, sobbing as if her heart would break.

"God doesn't love me any more," she wailed. "God doesn't love me."

"God doesn't love you! Why, dear, God loves every one," I assured her.

"Oh, no, he doesn't love me. I know he doesn't. I tried him with a daisy."—*Harper's Bazar*.

SEVERAL years ago, when Theodore Roosevelt, Jr., son of the President, was about to start away to a boarding school, he was asked by a friend of his father what he intended to do when he grew up to be a man.

"I haven't chosen a profession yet," replied Theodore, "and don't know what particular line of work I shall take up, but I do want to be great, like papa."

Quite different is the case of the son of Massachusetts' Governor at that time. This boy was called on by his teacher to give the names of the Governors of all the New England States. When he came to Massachusetts he balked.

"Why, don't you know who is the Governor of Massachusetts?" asked the teacher, and the lad again hesitated.

"Why, your own father is Governor of Massachusetts; didn't you know that?"

"Wal, he told me he was," replied the boy; "but I thought he was stringin' me."—*Boston Transcript*.

THE practice of dueling is on the decline in France, the country which has been peculiarly its home. It grows more ridiculous year by year, and those who engage in it become more and more a laughing stock. Not long ago a Paris journalist, who had by some criticism offended a politician, received from him the following letter:

"SIR: One does not send a challenge to a bandit of your species; one simply administers a cuff on the ears. Therefore, I hereby cuff both your ears. Be grateful to me for not having recourse to weapons.

"Yours truly, \_\_\_\_\_."

The journalist answered:

"MY DEAR SIR AND ADVERSARY: I thank you, according to your wish, for having sent me cuffs by post, instead of slaughtering me with weapons. Cuffed by post, I respond by despatching you by post six bullets in the head. I kill you by letter. Please consider yourself dead from the first line of this epistle.

"With a respectful salutation to your corpse, I am, Very truly yours, \_\_\_\_\_."

—*The Popular Magazine*.

## Some Curiosities of Honest Opinion

AMONG the interesting phases of our American social psychology, certain curiosities of honest opinion hold a high place.

In our class of wealthy and powerful persons there are honest individuals. They are honest not only technically, in the sense that they have not stolen or profited by fraud, but also subjectively. They take themselves seriously. They believe that they have always had clear views of right and wrong, and that they have conscientiously lived up to their principles. Their cardinal article of belief is that wealth is a reward of merit and an especial mark of divine favor. They are comfortable and happy. No disquieting suspicion that they are in any degree responsible for the miseries of the poor ever disturbs their complacency.

These persons have never inserted in their book of common prayer the invocation from Burns:

"O, wad some power the giftie gie us  
To see oursel's as ithers see us."

On the whole, they would not enjoy a literal answer to that prayer. But in the interests of the general welfare it is necessary sometimes to hold a looking glass before them, and make them for a moment see what their long suffering neighbors have to endure. In the performance of this necessary public service we offer them a glimpse at certain curiosities of honest opinion, which they hold and proclaim.

The other night at a gathering of college men, a gentleman who long ago amassed riches from manufacturing industries, and who at one time sat in the United States Senate, spoke feelingly upon the necessity of "a new Declaration of Independence." A more sincere speech one seldom hears. The orator's soul burned with indignation as he described the bondage into which the free born American laborer has fallen. No longer, it appears, can the free born walk, cap in hand, into the mighty presence of an American employer, and respectfully say: "Sir, I should like to

enter your service. My labor is my birthright, and I wish to sell it. Its value is fixed by the beneficent law of supply and demand, which an all wise Creator has ordained for our mutual benefit. You, in your great wisdom, and with an unselfish devotion to your country that all must admire, have thwarted the evil designs of those unpatriotic free traders who would degrade the sovereign American voter to the level of the pauper labor of Europe. I shall esteem it an honor, sir, to be entered on your payroll." Crushed and cowed by labor union despotism, this once upright workingman can no longer bargain for himself. He must accept such wages as the union, by collectively bargaining, obtains for him, and he can no longer joyously tend his employer's machine thru those long glad hours of overtime that once made him feel that he was a nobly useful member of society. Unless his lost liberty can be restored to him, the honorable ex-Senator told us, we must in humiliation confess that America is no longer the land of the free.

Inasmuch as the honorable ex-Senator was quite unconscious of that loss of liberty which had overtaken himself personally, when, some years ago, a great industrial combination absorbed the mills and the business that he had spent a lifetime in erecting, and converted him from a free-born, independent American manufacturer into a mere corpuscle in a trust, a carping mind may find difficulty in believing that his zeal for the independence of the open shop workingman was as thoroly sincere as we have acknowledged that it was. But fairminded readers will, we think, agree with us that there was no trace of disingenuousness in the performance. It was simply one of the curiosities of honest opinion.

Another example is afforded by a recent Sabbath utterance of a well-bred clergyman, who ministers to the spiritual necessities of multi-millionaires. When weekly turned of a Sunday morning from the sordid cares of this transitory life, made over strenuous of late by an assiduous President, to their chosen purveyor of eternal verities, he assured them

that great fortunes have here no long abiding. In the great plan of things he told them it has been ordered that good men, who serve their generation by accumulating vast riches, shall beget children of mediocre talents and spendthrift habits. It is, therefore, not only socialistic, but also disrespectful to Providence to proclaim a policy of converting great fortunes into the public treasury. The millionaires went away comforted, for they have great possessions.

Incredible as it may seem, this belief that great fortunes in America are dissipated, we can assure any sceptical reader, really is held by nominally intelligent persons as strongly today as it was two generations ago, when it happened to be substantially true. Those who hold it are not in the least dishonest in forgetting that the corporation is a legal person which can enjoy a life indefinitely long, and that the trick of incorporating estates has been invented. They forget these things, not in sheer wickedness, but only as a mere curiosity of honest opinion. The public ought, therefore, to regard them with kindly forbearance. Like the Texas organist who didn't want to be shot, they are doing the best they can: "Our Church and State, our courts and camps  
concede

Rewards to very moderate heads indeed!"

## The End of the Civilized Tribes

By law the death sentence of the Five Civilized Tribes, as tribes, of the Indian Territory was to take effect on the 6th of last March. But as the time drew near it became evident that the settlement of the estates of the deceased would be so complicated that it would be easier to let them live a while longer. So a reprieve was hastily granted, which was followed by an "indeterminate sentence."

By the act "For the Final Disposition of the Affairs of the Five Civilized Tribes," recently passed, "tribal existence and present tribal governments are continued in full force until otherwise provided by law." Hardly in full force, however, for the sessions of the tribal legislatures may not exceed thirty days; their ordinances are subject to approval by the President; and he may remove executive heads for neglect of duty or

disability and appoint some other member of the tribe to fill the vacancy. All tribal revenues are to be collected by the Secretary of the Interior, who will also pay just claims against the tribes. Taxes accruing under tribal laws are abolished, and those collected since December 31st, 1905, must be refunded. It is slower death, not new life, which has been granted these Five Tribes. "Upon the dissolution of the tribes" and "until the establishment of a State or Territorial Government" are the two refrains which run thruout the new law.

A sharp distinction is made between mixed bloods and full bloods. The latter may neither encumber nor alienate their allotments; nor may they make leases of any of their lands for a longer period than a year without the approval of the Secretary of the Interior. All inherited allotments may be sold, but if the heirs are full bloods their sales must be approved by the Secretary. All property may be bequeathed, but a full blood Indian may not by his bequest disinherit parent, child or spouse. What would we think of such a distinction between white men and mulattos?

Freedmen may neither sell nor lease their small allotments. Freedmen among the Choctaws and Chickasaws are grudgingly given the preference right to purchase enough land at its appraised value to make their entire holdings forty acres each.

In general, lands neither allotted, reserved or otherwise disposed of, may be sold by the Secretary of the Interior, nineteen sections of Choctaw and Chickasaw land with its valuable timber being specially mentioned; but all coal and asphalt lands, whether leased or unleased, are reserved from sale for an indefinite period, and upon the dissolution of the tribes, lands then undisposed of shall be held in trust by the United States for the benefit of the Indians. Here we see the work of Senator La Follette.

At that time buildings, furniture or land used by the tribes for governmental or school purposes may be sold by the Secretary, with the right reserved to a county or a municipality to purchase them at their appraised value. The proceeds from sales of tribal lands or other

property are to be distributed among the respective tribes per capita.

Educational affairs are to remain *in statu quo* until the establishment of a public school system under a State or Territorial Government. They are all placed under control of the Secretary of the Interior, who may apply to the support of the tribal schools as much tribal money as was expended for that purpose during the school year which closed on the 30th of last June, and to the education of both white and Indian children all the fees collected by United States officials in the Indian Territory for recording legal instruments. This goes far toward supplying the school needs of that region for the time being.

The shadow—or shine—of coming events is shown in the clause which gives to light and power companies a chance to acquire rights of way and the use of non-navigable streams, but reserves to municipal authorities the right to regulate the manner of construction and to subject the companies to taxation. The act also provides that the "tangible property" of railroads (except rolling stock) within incorporated towns "shall be taxed in proportion to its value, the same as other property."

This is the beginning of the end of the most interesting socialistic survival in this country; and much of the end will doubtless be found in the United States courts in the Territory, which are given jurisdiction of claims both for and against the tribes. To them also the railroads may carry their appeals from municipal taxation.

## Our Navy in France

THE three black-hulled French cruisers anchored in the North River, where they rested from their labors in assisting to deposit the bones of John Paul Jones in their last resting place were objects of merely curious interest to the crowds in Riverside Park, and the French marines, so conspicuous on our streets and pleasure islands in their neat blue uniforms with red revers are not regarded as a political factor. In contrast with this peaceful visitation of the French ships of war, our navy, especially

our future navy, is making a great deal of trouble in France.

President Roosevelt holds that a big navy is the surest guarantee of peace. He will soon have in Congress an ardent advocate of the same policy, Mr. Richmond P. Hobson, late of the "Merri-mac," now of Alabama, who wants a still bigger navy and for the same pacific purpose. The difficulty is that there is too much competition in the trade of peace making. All the other nations want to have peace—on their own terms—and they all are trying to secure it in the same way, by getting the biggest navy, following the Scriptural injunction to provoke each other to good works.

The debate on the naval appropriation bill in the French Senate during the session of April 9th is very interesting from this point of view. *M. le Ministre de la Marine* is one of the most patriotic of Frenchmen, altho you would not suspect it from his name, which is Thomson. His great ambition, his sole desire, is to make France an agent for peace in the world, and he does not like to see King Edward, Emperor William and President Roosevelt getting ahead of him in carrying out the promise of the angels on the first Christmas. He demands, therefore, of his already overtaxed country, a special appropriation of \$25,800,000 a year until 1919, as the minimum for the necessary increase of the navy.

Against this extraordinary expenditure Baron d'Estournelles de Constant, the leader of the peace party—perhaps we should say of the other peace party, the party that puts more faith in arbitration treaties than in warships—made an eloquent but ineffectual protest. In vain he quoted passages favoring a decrease in armament from President Roosevelt's addresses. Minister Thomson matched the quotations with others of a very different tenor from the same source. When the Baron quoted Secretary of the Navy Bonaparte's statement that "the question is not how large a navy we need, but how small a navy we can safely do with," Admiral de Cuverville showed what the Americans really meant by a small navy. Since 1895, he said, the United States had increased its naval expenditure by \$54,600,000, while the increase for the same period in Italy had

been \$4,400,000, in France \$8,400,000, in Russia \$30,000,000, in Germany \$36,000,000, and in England \$131,800,000. Including vessels on the stocks, the United States had expended for its navy in the last twenty years the sum of \$930,000,000. In 1898 the United States had in line against Spain four battleships; it will have twenty-three in 1908.

In reply to the argument that this increase in the American navy did not threaten French interests and did not call for an increase in their navy, the Admiral argued that the French holdings in the Antilles would acquire considerable importance from the opening of the Panama Canal, and in support of his view, told of a conversation he had with Secretary of State Blaine, in 1881, when he was sent as the representative of the French navy to the Yorktown centennial:

"Mr. Blaine was talking one evening in a very friendly way with the French delegation; we had turned the conversation on the question of the opening of the Panama Canal, and he said to me:

"'You will never construct the Panama Canal.'

"'But we will,' I answered. 'Why should we not do it?'

"'Oh, because your men die like flies.'

"And I replied: 'Supposing we cannot use the blacks, we can get Chinese.'

"He smiled, and said to me: 'I admit you may construct the Canal, but when you have done it,' he added with a significant gesture, 'we will hold the keys.'

"You see, the American doctrine has not varied, and the Union is firmly resolved to hold the keys of the Panama Canal."

In opposing the construction of larger battleships planned by the French Government, Baron d'Estournelles de Constant again endeavored to use the United States as a good example, and again he was defeated by the Government speakers, who pitted our practice against our precept. To prove that the United States did not favor the construction of battleships the size of the British "Dreadnought," he quoted Secretary Bonaparte as saying: "We are far from believing in the omnipotence of these leviathans and we will not follow the other Powers in this policy." Evidently the Government was better informed as to the real intentions of the Secretary, but they could only quote a newspaper report that the United States was to build a

19,000-ton ship. The Baron valiantly stuck by the official statement as against a mere newspaper rumor, and Admiral de Cuverville could only reply, "You will see."

Now we do see, for the House Committee on Naval Affairs reports in favor of a \$10,000,000 battleship, "carrying as heavy armor and as powerful armament as any known of its class, to have the highest practicable speed and greatest practical radius of action," and this is included on the recommendation of the Secretary of the Navy. Altogether the new naval appropriation bill calls for nearly \$100,000,000, and this is \$21,500,000 less than the Department asked for. Evidently it will be still harder in the future for the friends of peace to quote the example of the United States as an argument for decrease in armament.

## As to Charles Francis Adams

AN intelligent correspondent, principal of schools in a Louisiana town, and one who declares himself "a subscriber and great admirer" of THE INDEPENDENT, wants to know the sources of our information on the race problem as pertains to the South; that is, whether it comes from an intelligent and unprejudiced source. He also asks us to review the Hon. Charles Francis Adams's article in the May *Century* on the negro in Africa.

Our sources of information are those open to everybody. They are deductive, based on principles, and inductive, based on observed facts.

The main principle involved is that men are born free, and with the equal and inalienable right to life, liberty and the pursuit of happiness. This does not mean that men are born with the same color or brain, or that superior talent does not achieve superior results; but it means that no mere factitious difference is to exclude a man from the unhindered fruits of his own exertions. Law must not put disabilities on men to prevent their equal access to privilege. This is a principle of Christianity as well as of humanity and common ethics. The principle forbids slavery, serfdom, Jim Crow laws and the hindrance of the ballot. It

further requires us to deal with men as men and never as races.

Next as to observed facts.

We have observed that historically every advanced race has risen out of a condition as degraded as that of the Africans observed by Mr. Adams in the Sudan. There was a time when our ancestors in Britain and Germany and Russia were no more advanced than those negroes. Cæsar says that in Gaul the common people were "little better than slaves" to the chiefs and the druids. It is he that tells of the human sacrifices, men burnt in wicker cages. The Germans, he says, were clothed in skins, lived by hunting and not agriculture, had no fixed home, and had no public magistrates. They lived much like our nomadic Indians, and were less advanced than the negroes of Timbuctu or Zululand. Cæsar describes the Britons as barbarians, painted with woad, to make them look terrible in war, and living in companies with their wives in common. Tacitus says of the Sarmatians that they were in so hopelessly miserable a condition that they did not even need to pray. But out of such savagery, with no increase of brain power, simply by social heredity, by the access of imported civilization, by culture and education, has grown in these races the most splendid enlightenment the world knows. In those days such civilization was as hopeless as among the blacks of Nubia.

We have also observed that with their present superiority the Caucasians have been inclined to express a contempt for all other races. We have despised Hindus, Chinese and Japanese. But within fifty years we have seen the little yellow Japanese, whom even the Chinese called "monkeys," develop a complete civilization, equaling that of Europe, and conquer on land and sea the proud Russians.

We see no antecedent reason why, with similar civilization brought within their reach, Africans should not do as much. The best ethnologists tell us that they are not notably inferior in bodily size or in brain capacity. Even if they were somewhat inferior, a very large element of Caucasian blood is infused in this country. Many falsely classed as "negroes" are mainly Caucasian. In Africa, shut off from the world's civilization,

they have created large states and cities, and a native industry which includes the smelting of iron, as Professor Boaz has told us. It is a condition, whether pagan or Mohammedan, that is far above savagery.

Further, we have observed the progress made by the negroes in this country since the abolition of slavery. To draw a conclusion Mr. Adams visits Omdurman for a few days—a town just rescued from the Mahdi, where teaching by missionaries has been forbidden till this last year. We have carefully observed the results of forty years progress in our Southern States.

Slavery was abolished by act of war, against the will of the white residents. Immediately the white people attempted to organize State Governments and enacted laws of peonage to take the place of slavery. Those laws Congress annulled, and there has followed a period of jealous hostility, partisan and social. With great frankness, since in the Hayes administration we were compelled to give up the attempt at national protection, it has been the avowed effort of the Southern ruling class to suppress both social and political equality. The conditions have been very difficult for the negro. The whites have declared that the negro cannot rise, that he is inherently incapable of civilization. But he has risen rapidly, more rapidly than could have been expected. Dr. Nott, of Nott and Glidden fame, the chief scientific authority in the South before and after the war, pitiously declared that the negro, freed from the protection of his master, would utterly perish from the land, and that, in his incapacity to earn a living, the country would meanwhile have to feed the race as paupers. That was believed. Now the census tells us that the negroes, without immigration, have by natural increase grown since 1860 from 4,441,830 to 8,883,994 in 1900. They have doubled in forty years. That proves vitality and implies self-support. At the end of the war the negro owned nothing but his hands. In 1900 there were 744,471 farms owned or operated by negroes, being 41 per cent. of all negro homes. They represent a value of five hundred million dollars. There were 187,797 negro owners of the farms they operated. Similarly in

other lines of profitable work the negroes have made progress which we have no space to illustrate.

Nor have they failed in intellectual progress. With not over one dollar given by the Southern States for the education of a negro child to three for a white child, and thus with inferior schools, they have already learned, by a large majority, to read and write. There is yet an immense mass of black ignorance, chiefly in the sections where there is a large, tho smaller, mass of white ignorance. But the improvement is immense, thanks largely to outside support of higher schools supplementing the lack of State support. Thousands of negroes have graduated from colleges, have entered the learned professions, and not a few, in Northern universities, have shown equal proficiency with the abler white students, as proved by prizes in competition.

Now it is absolutely sure that the movement of the American negro is upward and not downward. The progress is remarkable and against serious discouragement. As yet there is no sign that it will stop. There is no slightest evidence that there is a lower level above which the negro cannot rise, for many have risen. This we have seen with our own eyes, in our own short lifetime. We have visited their cultured homes; we have examined their schools; we have had part in their education. We have taken no special concern with their ignorance, their vices, their laziness, their diseases, their large mortality; for these matters are not peculiar nor significant. What is significant is the trend, the movement, and that is plainly upward. Accordingly we consider the top things, not the bottom things; the schools, not the prisons. Jails count nowhere; it is the forces that lift that must always be considered, for they control and will prevail.

What, then, do we think of Mr. Adams's article? It needs vision and revision. There is no such essential, invincible inferiority. It is true that most negroes are commonplace people, satisfied where they are and having no initiative. So are most white people. We have to teach them divine discontent. Carlyle said they were "mostly fools." But in every

race there are leaders, able to look forward, eager to climb upward; and for a race that has one per cent. of such, willing to lead, there is hope; for more than half the rest will be led, and the remainder are of no account for history.

We are asked if Northern people will accept Mr. Adams's testimony. Doubtless many will. There is a tendency that way now. But this we see clearly, that they cannot think so long. By all present signs, in fifty years, by his intelligence and thrift, the negro will, in the agricultural States, possess his full proportion of wealth, culture and power; and we believe it will be welcomed by those who now oppose, and that it will be wisely used.

### Alcohol to Burn

OF all the numerous uses that alcohol can be put to the worst is to drink it and the best is to burn it, yet our present laws are so contrived as to permit the former use and prohibit the latter. The internal revenue tax on alcohol has been repeatedly increased since it was first imposed in 1862 to raise money to carry on the war until it now amounts to about a thousand per cent. *ad valorem*, yet no man is prevented from getting drunk on account of the high price of alcohol. On the other hand, people who want to use alcohol for better purposes, such as heating, lighting and manufacturing, cannot afford it. You can make a gallon of alcohol for 20 to 25 cents, but you have to pay the United States Government \$2.08 a gallon if you sell or use it. There is an exception to this. If you want to use alcohol for fortifying wines, that is, adding alcohol to light wines to increase their strength until they are as intoxicating as a whisky highball, the Government, apparently regarding this as a peculiarly laudable purpose, will let you have it with the tax off. Last year the tax was remitted on 3,500,000 gallons of alcohol for the purpose of adding to wines this most harmful of all adulterants.

Now there is a very simple way of getting rid of this inconsistency, a way that has been adopted by all other nations except ours, and that is to add to alcohol intended for industrial purposes

some liquid that will make it undrinkable and then allow it to be sold without tax. This is the object of the bill which has just passed the House of Representatives and is now in the pocket of Senator Aldrich, chairman of the Ways and Means Committee, where it is likely to stay unless it can be pried out in some way. The last that has been heard of it is that a committee has been appointed to take evidence on the subject. One would think that the volume of evidence just taken by the Ways and Means Committee of the House, together with the investigation made by the joint committee of the Senate and House in 1896 and the exhaustive British Parliamentary report of 1904, would have given the Senators information enough, but, of course, a bill like this which might seriously affect business interests, especially the prices charged by the Standard Oil Company for gasoline and kerosene, must be subjected to thoro deliberation, even if it takes all summer.

The demand for free alcohol is now much stronger than it has been, and the bill will not this time be so easily put out of the way as the former bills. Within the last few years two new and important uses have been developed for alcohol, its use for lighting and for power. The flame of alcohol is blue and gives off no light, but if a Welsbach mantle is hung in the flame we have the bright, soft incandescent light now used in city streets and houses where there is gas. In towns and country homes not having gas it is necessary to use the ordinary kerosene lamp, or the mantle lamp with gasoline. One gallon of alcohol will give as much light as two gallons of kerosene in an ordinary lamp, and since they would cost about the same per gallon it would mean a saving of half the lighting bill of the farmhouse.

Besides this alcohol can be used instead of gasoline in small motors such as are now extensively employed for running light machinery on the farms and in shops. There are over 5,000 of these alcohol engines in use in Germany at the present time. Many attempts have been made in Europe to use alcohol for automobiles, but without much success, so its employment for this purpose is problematical. It has the great advantage

over gasoline that it is much less explosive. The vapor does not take fire so readily, and the burning alcohol can be put out with water, while a gasoline fire cannot. Besides being useful for lighting, heating and power, tax-free alcohol would be of great advantage to many manufactures, such as hats, varnishes, smokeless powder, photographic material, celluloid, transparent soap, and the like.

The extent of the industrial use of alcohol would depend upon its price when the tax was removed, and about this there is great dispute. The moonshiners have shown how cheap and easy it is to set up and run a still, and anything containing starch or sugar, such as corn, potatoes or molasses, can be used for material. Since spoiled corn and beet sugar molasses and cheap molasses from the West Indies can be used, it is quite possible that alcohol can be prepared and sold for 25 cents a gallon, possibly as low as 15 cents.

There are two objections to removing the tax from industrial alcohol that must be considered; one is the injury it will do to the wood alcohol industry and the other is the evasion of the revenue. There are several thousand different alcohols possible and several hundred of them are known. The chemist gives them pretty names, such as would do for heroines in historical romances, methyl, ethyl, propyl, butyl, amyl, and the like, but of these most people are only acquainted with two, ethyl alcohol, which is made from grain or fruit and forms the enticing ingredient of wine and whisky, and methyl alcohol, which is made by the destructive distillation of wood and has come into extensive use in manufactures as a substitute for ethyl or common alcohol. The manufacture of methyl or wood alcohol is one of our few triumphs in industrial chemistry, and an interesting story might be told of how American chemists caught the smoke from the charcoal kilns and made from it methyl alcohol, acetic acid and other products worth more than the charcoal, so the charcoal became a by-product. This industry, which now produces 7,500,000 gallons a year, has grown up under the shelter of the prohibitive tax on its rival, and should not be ruthlessly destroyed. But

it is not probable that this would follow the proposed legislation, for much, and in time possibly all, of the wood alcohol now made would be used in denaturing or rendering unpotable the tax-free ethyl alcohol. In England ten per cent. of wood alcohol is used as a denaturant, and it might be well to adopt this instead of the  $2\frac{1}{2}$  per cent. used in Germany, at least for a few years, while ethyl alcohol was coming into use, so the wood alcohol industry could become adjusted to the new conditions.

All the alcohols of this family are poisonous, but methyl is worse than ethyl. It causes blindness among the workmen who have to inhale its fumes, and many deaths have been caused by drinking what is called "Kansas whisky," which is methyl alcohol diluted with water and sweetened with sugar. Doubtless, too, men will drink the denatured or methylated alcohol, when it is sold free of tax for industrial purposes, but they will be those dipsomaniacs who now get drunk on red ink, perfumery and liniment, and the world will not lose much by their death. This question of the amount and character of the denaturant, as well as the other regulations to prevent violations of the revenue, is wisely left by the pending bill to the Treasury Department.

## The Oil Trust and the Railroads

OPPONENTS of the pending Railway Rate bill have said that rate-making was an extremely difficult task, which should be left to experts in the companies' service. The Interstate Commerce Commissioners, they have asserted, could not be competent to deal with it, and should not presume to enter a field of scientific effort in which their blunders would do all sorts of harm. In the Garfield report upon the Standard Oil Company's railroad freight rates we see all the complications and refinements of a kind of rate-making that was designed to give a great and greedy corporation enormous advantages over all possible competitors. It is a remarkable exhibition of the many ways in which the skill of rate-makers utterly devoid of conscience may be used for the promotion of injustice and wrong.

No device that an expert in rates could suggest for giving the great Oil Trust an unfair, or even an unlawful, advantage over such competitors as still survived, appears to have been left unused by the railroads of the United States. It is true that the skill of an expert is required for such rate-making, but the work is that of an expert counterfeiter or thief rather than that of an honest man engaged in respectable labor. The sooner the Commission's heavy hand is laid upon the complications of such rate-making the better for the American people and for the railroad companies themselves.

This great volume of evidence, showing how the laws and every rule of fair play have been violated in all parts of the land by common carriers in order that the Oil Trust might overcome all competition and establish its power to tax the public unjustly, completely answers the arguments of those who have urged that the Commission should not be authorized to supervise the open rates. It is by an ingenious arrangement of open rates, as well as by the use of secret ones, that the interests of the Oil Trust have been and still are wrongfully served. These proofs, together with the recent evidence of railway combination control of the anthracite coal industry and of the bituminous coal trade in the Eastern States, leave no ground for further reasonable opposition to the enactment of the pending Rate bill.

Of course, the Oil Company and the railway companies should be prosecuted for every violation of the law. Many of the secret rates by which the Oil Company has "benefited enormously," the President says, were "clearly unlawful." The Company, says Commissioner Garfield, "has habitually received from the railroads and is now receiving secret rates and other unjust and illegal discriminations." Many of these discriminations, he asserts in another place, "were clearly in violation of the Interstate Commerce law." Unfortunately, there is reason to believe that, owing to the manner in which the Commissioner's information was obtained, the Oil Company's officers may successfully claim immunity and thus escape punishment. But there should be prosecutions in every

case where it can be shown that the law has been broken.

It will be observed that, in replying to the charges of the report and of the President's message, the officers of the Oil Company say that certain railroads which have caused or promoted discrimination, and not the Oil Company, "should be the object of attack," so far as their action in refusing to prorate is concerned. It should not be overlooked, however, that the Oil Company's officers exert great influence in many railroad companies by reason of their holdings of stock and their directorships. One of these officers, Vice-President William Rockefeller, is a director in nineteen railroad companies, among these being the New Haven and the New York Central, and other prominent officers hold places in the boards of great railway systems.

The influential interest of the Standard Oil group of multi-millionaires in the leading railway companies of the United States is a matter of common knowledge. As railway directors they have approved, and they may have suggested, that unjust use of rates (for the benefit of their Oil Company) which the Government denounces, and for which they now ask the public to hold the railways exclusively responsible. If any railway company of which a Standard Oil officer is a director has violated the law by giving rate favors to the Oil Company, by that director's protest the unlawful action could have been prevented. The protests of Standard directors would have been effective, for example, with the management of the Central, the New Haven, the Atchison, the St. Paul, the Union Pacific and several other roads.

Mr. Roosevelt asks that an element of competition be introduced, in the field which the Oil Company practically monopolizes, by the passage of the bill removing the tax from alcohol prepared for use in the arts and manufactures. To what extent denaturized alcohol would compete with the Oil Company's products we do not know. The bill ought to be passed, however, for other reasons. We are heartily in favor of the President's recommendation concerning the control of oil or coal lands now held by

the Government. These should not be sold.

There is nothing in the Garfield report to surprise one who is familiar with the history of the Standard Oil Company. This organization was a product of unjust discrimination in freight rates, and it has fattened upon such discrimination at the expense of many independent refiners, who were driven out of business by the unjust practices against which it was useless to protest. The laws ought to have been enforced many years ago for the restraint and punishment of this corporation and the railway companies that conspired with it to oppress and to rob. We hope the day is at hand when new laws and the enforcement of old ones will end this industrial and commercial piracy.

As for the railroad companies, or the capitalists who control them, they should understand that the Garfield report, with its facts and figures, is an indictment of much greater weight than even the recent proof of oppression and extortion by railway combinations in the coal districts. With this evidence before them, how can the people believe that the officers of the companies were sincere when they met, last year, and proclaimed their determination to discriminate no more? Unless the people become convinced that such favoritism as this report reveals is to be ended by legislation, prosecution and other executive action, they will insist upon Government ownership of the entire railway system.

#### The Site of San Francisco

The memory of Horace Bushnell would never die out if only for his achievements in broadening and deepening religious thought. But he was a leader in civic affairs, quite as notably as in theological. In a remarkable essay on "City Plans" Bushnell wrote that San Francisco was, carelessly or accidentally, located unfavorably. After showing how Sacramento and Marysville, which are actually below high water mark, could both of them have secured ample high ground, and equally convenient at the distance of about a mile, he adds that just over the bay from San Francisco, at

a little hamlet called San Pablo, nature had laid out a great city plot, about five miles square; had graded it handsomely down to the bay, supplying it with the very best water, breaking out of a gorge in the hills; giving it also a straight path out to the sea for ships—not omitting an open sweep for railroad connections from the north, east and south. Behind the rock summit, on its mid front, he noted a natural dock ground, two miles long, open to deep water at both ends.

"In short, there was never in the world such a site for a magnificent commercial city; but alas, the city is fixed elsewhere by the mere chance landing of adventure, and a change is forever impossible."

Is it possible that the earthquake has given San Francisco a chance to reconsider the wisdom of her location, and adjust herself to her destiny, as one of the greatest commercial cities of the world? Probably no man has ever lived in America whose judgment was sounder on civic questions, especially of civic improvements, good roads and the general progress of village art than Horace Bushnell.

Quis Custodiet  
Ipsos Custodes?

It is a very foul story that is told by ex-Consul-General Mc-

Wade against ex-Assistant Secretary of State Peirce, who, like Assistant Secretary of State Loomis, was sent on a trip about the world as inspector of consulates. His report as to the behavior of Mr. McWade at Canton led to the latter's removal; and now McWade retaliates by damaging charges against his accuser. According to his story Mr. Peirce practically compelled McWade to make him a valuable gift with the promise of a favorable report, and then broke his promise, and secured the signatures against him of a lot of disreputable adventurers. These charges seem past belief, for Mr. Peirce, son of Benjamin Peirce, the famous Harvard mathematician, has had a creditable career in diplomatic positions, and is now slated for Minister to Norway, which will compel careful consideration of the charges by the Senate before confirmation. The charges against Mr. Loomis have never been investigated by Congress, and his

expected nomination to a diplomatic post has been delayed, probably to avoid such investigation of his acts in the Senate.

The French  
Election

The noise of the combined Legitimists and Socialists has not disturbed the French electors, who have returned a Chamber of Deputies which will support the separation of Church and State. The mobs which resisted the officers taking a valuation of the property of the churches, the "*Vehementer*" condemnation of the law by the Pope, and the disturbance by the strikes have not affected the calm trust in the Republic of the great mass of the voters. It looks as if a more serious mood had taken the place of former levity and inconstancy. The Royalists and Imperialists may now be dismissed as of no importance; any future danger will be from the other extreme of anarchy, under the name either of socialism or labor. Equally the pact between the Church and the Legitimists proves harmless, for France does not wish to be ruled by ecclesiastics. It is to be hoped that the Catholic irreconcilables who refused to obey Leo and accept the Republic, will now accept the inevitable. M. Brunetiere has told them they had better not fight; and their best hope is to accept his advice and that of Belial under strenuous conditions, and make the best of what they cannot help. Then: "This horror will grow mild, this darkness light; Besides what hope the never-ending flight Of future days may bring, what chance, what change, Worth waiting;" and we believe that the "affable angel" Raphael or the "guardian angel" Michael would give the same advice to the Church:

"Then wilt thou not be loth  
To leave this Paradise, but shalt possess  
A Paradise within thee, happier far."

That is the kind of Paradise which the Catholic Church possesses in this country; where the Church asks no favors of the State, but is strong, trusting solely in God and the loyalty of its own members. That is why in no other country is the Catholic Church so happy and so spiritually effective as in the United States,

# Insurance

## San Francisco Losses and Rates

As outlined in this department last week one of the results of the San Francisco disaster has been an advance in rates that now promises to be exceedingly widespread in its application. At a meeting of the Fire Insurance Exchange, which represents all the fire insurance companies doing business in Greater New York, held in this city last week, a resolution was adopted raising the premium rates on all classes of risks from 10 to 25 per cent. A considerable reduction was likewise made in the future brokerage rates and in commissions.

At first glance it would appear that this advance in rates and other action on the part of the exchange, under the circumstances which now exist and particularly when it is remembered that many insurance companies have suffered losses which run into millions of dollars and which have in too many instances wiped out surpluses and even impaired capital, was perfectly legitimate.

The action of the New York Exchange, whether right or wrong, will doubtless be followed by similar exchanges thruout the country.

When the proposition to raise rates all over the country, to meet company losses at San Francisco, is carefully studied, however, it will be seen that such a proceeding is not based upon correct principles. In exemplification of the fallacy that is made basic for the general raising of rates, the Continental Insurance Company, which stands aloof in this movement, has issued a statement setting forth the reasons for the position taken by them in opposition to the other companies which intend to raise rates. Says President Evans:

"We believe in a rate that fairly compensates our stockholders for the risk the capital and surplus belonging to them runs, with a further profit of not over 5 per cent. for the building up of a conflagration fund, which of course, would, under the American method of making statements, become a part of the so-called net surplus.

"This profit is measured, in our opinion, by 12½ per cent. as a maximum on the premiums earned. Our profit on the business in Greater New York has been, ever since the formation of the present rating organization, the New York Fire Insurance Exchange, more than 12½

per cent., and our business as a whole, with a premium income in the United States of about six million dollars, showed a profit of more than 12½ per cent. for the year 1905.

"Our city conflagration lines are carefully watched, and we are prepared to pay any legal claims made upon us as the result of loss under hazards covered by our policies. We do not believe that it is wise or proper to penalize property owners in New York or elsewhere now paying adequate rates because of an unusual loss due primarily to an earthquake in San Francisco, and we shall oppose to the extent of our ability the taking of such action in New York and other cities or sections of the country where the rates are now adequate.

"The companies as a whole have, in the present situation, the opportunity of the century to put the fire insurance business on a stable and businesslike basis, winning the good will and confidence of the public. If, on the other hand, rate advances are made that cannot be justified by the hazard incurred, adverse legislation is sure to result, and in a very short time the companies now banded together to 'jam' thru these advance rate resolutions thruout the country will be at each other's throats, and rate cutting will be the order of the day. The Continental is in business to stay, and we do not intend to be stampeded by the Eastern Union's Committee of Fifteen."

If the insurance companies generally had been doing business in the United States on a losing basis for a long term of years it would be right for them to increase rates. The insurance business as a whole, however, is known to have been profitable and if the profits have been too largely distributed as dividends instead of maintaining adequate or conflagration surpluses, that fact should not be permitted to provide an excuse for advancing rates thruout the country.

The Continental's record shows that the insurance business can be done profitably at present rates, and the other companies may well take a leaf out of the Continental's book, instead of now attempting to take refuge because of poor financeering in a general rate advance, charging it to San Francisco.

THE Pacific Coast managers estimate that it will cost the American Control Insurance Company, of St. Louis, almost a half million dollars to meet its Pacific Coast losses, but if the entire amount at risk on the burnt district of San Francisco is a total loss, the net surplus will be more than enough to meet it and to continue the business without interruption.

# Financial

## The Securities Market

SINCE the San Francisco fire there has been a notable decline in the market value of securities on the Stock Exchange, culminating in the heavy liquidation of the 2d inst., when nearly 2,500,000 shares were sold. The record shows that from the highest quotations on April 17th to the lowest on May 2d the loss ranged from 7 points for Steel shares, 11 for Pennsylvania, 14 for New York Central, 18 for Union Pacific, and 26 for Reading, to 41 for Northern Pacific, 50 for Great Northern, and 60 for Anaconda Copper. But only in a few cases have the lowest figures for railroad stocks in 1905 been reached, and the industrials, as a rule, are still far above their lowest quotations for that year. Prices had been lifted considerably above the level that could be reasonably supported by dividend returns. The disaster at San Francisco accelerated a natural reaction, and the unloading of speculative pools was assisted by the operations of bears who sought to take advantage of both the sentimental and the actual effect of the San Francisco losses.

Further liquidation and additional assaults by speculators seeking profit in a decline may cause further depression, but it must be admitted that the general situation is excellent. Business is active and profitable, railroad earnings exceed those of corresponding periods in past years, the demand for iron and steel continues to be of an extraordinary character, the most menacing of labor controversies has been settled peacefully, and large crops are promised. There is nothing in sight to check prosperity. The decline in securities thus far marks the losses of speculators and indicates no depression of industry and trade.

## Mortgage Tax Repealed

AT the close of a continuous session of nearly thirty hours, on the 2d inst., the New York Senate passed, by a vote of 37 to 11, the bill substituting for the present annual tax of  $\frac{1}{2}$  of 1 per cent. on mortgages a recording tax of the same amount, which is to be paid only once. The same bill was then passed in the Assembly by a vote of nearly four to one,

and it is now in the Governor's hands. As it was amended to meet the objections set forth when he vetoed the measure in its original form, his approval will probably be given within a short time. It is difficult to account for the bitter opposition which this bill encountered at the hands of a filibustering minority in the Senate. The tax was a burden upon borrowers. It should never have been imposed.

....Edgar McDonald, recently cashier of the Nassau National Bank, of Brooklyn, has been elected second vice president of the same institution. Daniel V. B. Hegeman has been promoted to the office of cashier.

....J. J. Hill's preparations for the construction of a railway in Canada, from Winnipeg to the Pacific, parallel to the Canadian Pacific road, appear to have been caused by an extensive invasion of the Great Northern's territory by the Canadian Pacific and its subsidiary lines.

....George Foster Peabody has withdrawn from the firm of Spencer Trask & Co., on account of his desire to devote more of his time to his work as treasurer of the General Education Board and to philanthropic undertakings in which he is interested. Charles G. Smedley and Erastus W. Bulkley, who have been connected with this banking house for some time, have now been admitted to membership in the firm.

....The directors of the American Waltham Watch Company have announced an intention to enlarge the plant at Waltham and increase the number of employees from 3,500 to 6,000. They propose that the corporation shall be known as the Waltham Watch Company, and that its capital stock shall be increased from \$4,000,000 to \$12,000,000, of which \$5,000,000 shall be in preferred shares. In exchange for each share of the present stock there will be given one share of the new preferred and one and three-quarter shares of the new common.

....Dividends announced:  
Niles-Bement-Pond Co. (Preferred), quarterly,  $1\frac{1}{2}$  per cent., payable May 15th.

## Survey of the World

### Exciting Debate on the Railroad Bill

In the closing days of the long debate upon the Railroad Rate bill, disclosures and charges of a sensational character have been made. The acceptance by the Republicans of what is called the Allison amendment, with the President's approval, appears to have assured the passage of the bill by Republican votes and without Democratic aid. As early as on the 8th this amendment was accepted by nearly all of the Republican members. Holding that it would permit that broad review by the courts which they and a minority of the Republicans had opposed, the Democrats asserted that the President had changed his attitude and deserted them. On the 11th the Allison amendment was brought before the Senate, and much bitterness was exhibited in the discussion. Mr. Bailey's amendment, forbidding the courts to suspend an order of the Commission by temporary injunction, pending judicial review, was rejected by a vote of 54 to 23, with similar propositions from Mr. Culberson and Mr. Bacon. In defending his amendment, Mr. Bailey criticised the President, saying the latter had compromised and committed his friends, having surrendered either because he was weary of conflict or in order that party harmony might be preserved. Mr. Rayner, in support of an amendment limiting the scope of a review by the courts (which was afterward rejected, 55 to 24), said that the President could not see a trap without fooling with it, and was now hopelessly caught in one. He declared that the Allison amendment was a "cowardly subterfuge," and he congratulated the railroad presidents upon their vic-

tory. Mr. Allison asserted that his amendment imposed the restrictions which Mr. Rayner desired. To this Mr. Bailey responded that the broadest possible review was permitted by the amendment; it was satisfactory to Mr. Allison and Mr. Aldrich, both of whom had contended for unlimited review. "Mr. Aldrich," he added, "always knows when he is getting what he wants." On the following day, the 12th, the Allison amendment was adopted after a remarkable discussion. Mr. Carter defended the President in a partisan speech, parts of which excited the resentment of Mr. Bailey, who in his reply reviewed the President's record concerning railroad legislation, striving to make it appear that the latter had surrendered in this matter and also with respect to tariff revision. "Let us have no more talk in the Senate and in the country," said he, "about this 'iron man.' He is clay, and very common clay at that." Mr. Tillman read a long written statement, purporting to be an exact record of negotiations carried on by the President with himself and other Democratic Senators thru the agency of ex-Senator William E. Chandler and Attorney-General Moody.

### A Falsehood, the President Says

The purpose of these negotiations, it was alleged, had been to secure a majority (composed of nearly all the Democrats and about half of the Republicans) for the passage of the bill with provisions carefully restricting the action of the courts. Mr. Tillman's record began on March 31st, when the President, he said, sent for Mr. Chandler and told him he desired to get into com-

munication with Mr. Tillman and Mr. Bailey. Mr. Tillman read the following as a part of the record:

"Mr. Chandler said the President had stated that he had come to a complete disagreement with the Senatorial lawyers who were trying to defeat or injure the bill by ingenious Constitutional arguments, naming Senator Knox, in addition to Senators Spooner and Foraker; that the President stated carefully and deliberately the basis upon which he thought there could be co-operation, namely, an amendment expressly granting a court review, but limiting it to two points—first, an inquiry whether the Commission had acted beyond its authority, and, second, whether it had violated the Constitutional rights of the carrier. Mr. Chandler stated that the President repeated that he had reached a final decision that the right to review should be thus limited; that thus far he would go and no further; that the decision would be unalterable."

It appeared afterward that these were substantially the words of a report written by Mr. Chandler himself. Mr. Tillman went on to say that for some time thereafter he conferred with Mr. Chandler every day, and then in company with Mr. Bailey conferred with Mr. Moody, who was in accord with them and who prepared a memorandum of the desired amendment. The two Senators afterward reported to him that they had secured 26 Democratic votes for it, and that only 20 Republican votes were needed. This was the situation when they heard, on May 4th, that the President had sent for 36 newspaper correspondents, announced to them his hearty approval of the Allison amendment, and assured them that in this amendment he was getting all he desired. "We had won our fight," said Mr. Tillman, who added that Mr. Allison had assured him that 22 Republicans would vote for the proposed restrictions. His relations with the President were known to be unfriendly, but he had pocketed his pride, thinking it was "necessary to co-operate with Theodore Roosevelt to pass a good law." He left the public to judge as to the President's treatment of himself and his failure to report his change of mind to those with whom he had sought to enter into negotiations. Mr. Dolliver, Mr. Clapp and other advocates of a limited review replied to all this, warmly defending the President and asserting that he had not changed his views. Later in the day, Mr. Lodge said that he had

communicated with the President by telephone concerning what Mr. Tillman's statement had said about the President's references to Senators Knox, Spooner and Foraker. He had written down the President's comments, which were as follows:

"The statement attributed to me by Mr. Chandler is a deliberate and unqualified falsehood. Senator Foraker's name was never mentioned at all in the conversation. Senator Spooner's name was only mentioned by me to express a cordial approval of Senator Spooner's amendment. As to Senator Knox, I said that I did not agree with a portion of his proposed amendment, but that I thought he had made out a very strong argument for asserting affirmatively the jurisdiction or the authority of the court."

On the 13th Mr. Tillman read Mr. Chandler's report of the first interview with the President, on March 31st. Mr. Chandler himself, while corroborating Mr. Tillman, refrained temporarily from making any statement. On the 12th the main part of the Allison amendment, conferring jurisdiction upon the Circuit Courts, was adopted without a division, and by a vote of 73 to 3 there was added the proviso requiring notice and a hearing before the granting of an injunction suspending an order of the Commission.

#### A Letter from the President

The President's statement, in the form of a letter to Senator Allison, was given to the press on Monday. He had been asked, he said to see ex-Senator Chandler "as the representative of Senator Tillman," and therefore had directed his secretary to make an appointment with Mr. Chandler. At his instance Mr. Moody held conferences with Senators Tillman and Bailey and with many other Senators. He (the President) had said to Mr. Chandler what he had said to all, that while the House bill was entirely satisfactory to him, as recognizing the right of review by the courts without defining or limiting that review, yet he was willing that there should be an amendment limiting review to the two questions "whether the Commission had acted *ultra vires* and whether any man's constitutional rights had been impaired." He had never said to any one that he should insist upon any particular provision. In the case of no

one had there been the slightest opportunity for any honest misconception of his attitude. After he had been informed by various Democratic Senators that they could not agree upon any amendment, he had found the Allison amendment entirely satisfactory. This amendment did not weaken the bill, nor *did* it in any way change the scope of the court review as provided in the original measure. This was the opinion of Messrs. Moody, Root and Taft.—With this letter was one from Mr. Moody to the President, giving an account of the conferences held with Senators Tillman and Bailey “by your direction,” because the President had been informed thru a third person that they were willing to support an amendment limiting review to the two questions mentioned above. This, the President said, would be acceptable to him. There were several conferences, and Mr. Moody sent to Mr. Bailey the draft of an amendment. Then he was told by the President of the information that an agreement among the Democrats upon any amendment would be impossible. Thereafter he suggested that further conferences be held with Senator Allison. There was nothing in the conferences that in any way bound the President to any particular amendment.—Mr. Tillman denies that he sent Mr. Chandler to the President. Mr. Chandler says he did go to the White House as Mr. Tillman’s emissary.

#### Important Amendments Adopted

During last week several important amendments, besides the one bearing Mr. Allison’s name, were added to the Railroad bill. Corporations transporting commodities in pipe lines across State boundaries were made common carriers and thus brought under the supervision of the Commission. The Elkins amendment, designed to keep railroad companies out of the coal mining business, was passed by a vote of 67 to 7. It is as follows:

“From and after May 1st, 1909, it shall be unlawful for any common carrier to transport from any State, Territory, or District, of the United States to any other State, Territory, or District, of the United States, or to any foreign country, any article or commodity

manufactured, mined, or produced by it, or under its authority, or which it may own in whole or in part, or in which it may have any interest, direct or indirect, except such articles or commodities as may be necessary, or used, in the conduct of its business as a common carrier.”

This appears to affect the Standard Oil Company’s pipe line business. The old penalty of two years’ imprisonment for the givers of rebates was restored, and the limit of the fine increased to \$20,000. Shippers receiving rebates were made liable to a fine of three times the rebates. Some remarked that, according to the Garfield report, the Standard Oil Company might thus be liable to a fine of \$2,250,000 for the rebates of one year. The granting of passes was forbidden by a stringent amendment, which may hereafter be modified. Express companies and sleeping car companies were placed under the supervision and regulation of the Commission. The period of the statute of limitations for the offenses covered by the bill was prolonged to six years. A majority of these changes were made by unanimous vote, and in no case was there any considerable opposition. Futile attempts were made to weaken the important provisions of the bill relating to the keeping of uniform accounts and to the official inspection of them.

**Labor Questions** Addressing the coal miners’ convention at Scranton last week, President Mitchell said that the union had secured what it had never had before, a signed agreement with the operators. He had been informed, he added, that if the number of union members had not increased to 80,000, the operators would have carried out their intention to reduce wages and increase hours. On the following day the operators published a denial that they had intended at any time to make such changes.—The religious revival meetings in Chicago, for which preparations have been made by Bishop McCabe, will be boycotted by the Chicago Federation of Labor, owing to the employment of non-union printers by the Methodist Book Concern. Pickets stationed in front of the meeting places will hand “unfair” notices to those who attend.—By the Vermont Supreme Court, the

right of the Patch Manufacturing Company, of Rutland, to collect a judgment of \$2,500 from individual members of the local Machinists' Union has been sustained. Judgment for this sum was obtained in a suit against the union for damages caused by a strike three years ago. The company could not collect from the organization, whose assets were small. When it sought, under a State law, to collect from individual members, its right to do so was contested.—In New York last week Charles Moran and Thomas Weir, members of the House-smiths' and Bridgemen's Union, who were arrested in February while preparing to blow up with dynamite an unfinished building where non-union men were employed, were sentenced by Judge Foster, Moran to be imprisoned four years and Weir to be confined in the Reformatory. Moran had confessed and Weir had pleaded guilty. The union has been on strike for a long time against certain firms that are erecting steel-frame buildings.—Owing to the strike, on the 11th, of the 1,600 members of the Funeral Drivers' Union, in New York, many mourning families were annoyed and disturbed. Several funeral processions were abandoned by strikers when the coffins were on the way to the grave. In some instances non-union drivers of hearses or carriages were attacked with stones and clubs, and there was disorder in front of churches and of dwellings where the dead were awaiting burial. One hearse bore gaudy streamers to mark the strikers' victory over a coach owner who had yielded. Nearly 200 funerals were postponed. On the night of the 12th a settlement was reached, the Funeral Coach Owners' Association granting the demand for an increase of wages from \$12 to \$14 per week.

#### Panama and the Canal

It is understood that there is an even division in the Senate Committee on Inter-oceanic Canals concerning the question whether the Canal shall be made at the sea level or with locks. Two members are absent. One of them, Mr. Gorman, is seriously ill, and the other, Mr. Carmack, prefers a sea-level cut.—Chairman Shonts, in an official report about his recent visit to the Isthmus, says

that the time is near at hand when a final decision as to the type of canal will be essential to a continuation of the work. Action in some departments has already been delayed by the failure to decide. The preliminary work is nearly finished. Order has been maintained with remarkable success in the Zone, where there are now 23,000 employees. Crimes of violence are almost unknown. All differences between the railroad company and the Pacific Mail Steamship Company have been amicably settled.—It will be recalled that one reason given by Chief Engineer Wallace for his desire to give up his place was that another, with a much larger salary, had been offered to him. This new place appears to have been the presidency of a corporation which was formed last week, under the name of the Electric Properties Company, with a capital of \$12,000,000. He is the president of this company, in which George Westinghouse and Thomas F. Ryan are interested, and which will acquire, or construct, and develop properties depending upon electricity for power.—Secretary Taft declines to assume responsibility for requiring the Commission to buy only such supplies and other goods as are produced in the United States. Those who desire to prevent the purchase of goods produced abroad will probably ask Congress to instruct the Commission in accordance with their wishes.—In June there will be elections in the Republic of Panama. An officer from the States, who had been employed to organize the Panamanian police, recently resigned. In a statement cabled from Jamaica a few days ago he said that he had been instructed that the police were to be used to control the elections in the interest of the present Government by preventing the Liberals from voting or registering, and that he was expected to direct them in the work. This he declined to do. In answer to inquiries from voters and from Governor Magoon, Secretary Taft has sent to the Governor a letter of instructions as to his action if there should be a revolution. In his judgment, he says, an insurrection in any part of the Republic would disturb order in Panama and Colon and adjacent territory, and greatly increase the difficulties of making the Canal. While our Government should not inter-

vene, he continues, until it is shown that the Republic cannot maintain order, the United States may, properly, under the provisions of the treaty and of the Republic's Constitution, and to prevent interference with the work of canal construction, suppress insurrection in any part of the Republic. A request from the President of Panama for intervention would be, he adds, the best evidence that the local Government was not able to maintain itself.

#### The Philippine Islands

No attempt has yet been made to bring before the Senate the House bill greatly reducing the tariff duties upon products of the islands when imported into the States. It is in the custody of a hostile committee. Authoritative denial has been given of a report that the President and Secretary Taft were willing to accept a compromise upon the basis of a reduction of the duties to 50 per cent. of the Dingley rates and of a rejection of the clause providing for absolute free trade after 1909.—In Samar, the fanatical outlaws called Pulajanés continue to attack the people of coast towns. On the 12th they entered the town of Inabangan, killed one resident, wounded seven, took twenty prisoners and burned more than thirty houses. Governor Curry, who is now in Manila, says that all the Samar mayors will soon unite in urging the Governor-General to take measures for the complete extermination of these marauders. About 300 of them remain in the mountains. Their leader, sixty-four years old, has been an outlaw there for forty years.

#### The Opening of the Duma

Russia's first national legislative assembly, elected by the people, opened on May 10 with a speech from the Throne, and at once settled to work in peaceable and orderly session as tho it were composed of veteran parliamentarians. The address of the Emperor is said to have been his own composition, as he rejected all the drafts submitted by his advisers, and this seems very probable, for its colorless and commonplace tenor is quite what was to

be expected from one of his character. If it contained nothing encouraging, it, at least, avoided any provocative expressions. On account of its historic interest we quote it in full:

"The Supreme Providence which gave me the care of our fatherland moved me to call to my assistance in legislative work elected representatives of the people. In the expectation of a brilliant future for Russia, I greet in your persons the best men from the empire, whom I ordered my beloved subjects to choose from among themselves:

"A difficult work lies before you. I trust that love for your fatherland and your earnest desire to serve it will inspire and unite you. I shall keep inviolate the institutions which I have granted, with the firm assurance that you will devote all your strength to the service of your country and especially to the needs of the peasantry, which are so close to my heart, and to the education of the people and their economical welfare, remembering that to the dignity and prosperity of the State not only freedom but order founded upon justice is necessary.

"I desire from my heart to see my people happy and hand down to my son an empire secure, well organized and enlightened. May God bless the work that lies before me in unity with the Council of the Empire and the Imperial Duma. May this day be the day of the moral revival of Russia and the day for the renewal of its highest forces. Approach with solemnity the labors for which I call you, and be worthy of the responsibilities put upon you by the Emperor and people.

"May God assist us."

The speech from the Throne was delivered in the Winter Palace in St. Petersburg, to which the Czar was conveyed by boat from Peterhof for the occasion. It was the first time he had entered the capital since January 19, 1905, when, at the blessing of the Neva, he narrowly escaped assassination by a charge of grapeshot from a saluting battery. The streets and palace were heavily guarded with troops and the Emperor did not show himself to the people. In the white marble hall of St. George in the Winter Palace the scene was a brilliant one, only equalled by that of the coronation. The Czar and Czarina were surrounded by the court, military officers, and foreign ambassadors, and there was a long religious ceremony by the higher clergy of the Greek Orthodox Church. His speech was received with great applause from courtiers and officials, in which, however, the delegates of the Duma did not join. They, then, retired to the Tauride Palace, where thousands of people had assem-

bled to greet them. There the delegates took the oath of office and signed the roll of membership, and then proceeded to the election of a president. Professor Muromtzeff, the senior member from Moscow, the candidate of the Constitutional Democrats, was chosen. The first speaker, very appropriately, was Ivan Petrunkevitch, who, in behalf of the Tver Zemstvo, had presented to the Czar on his accession a petition for a national assembly, which had been dismissed with contempt. As soon as President Muromtzeff took the chair he ordered the Government officials to withdraw from the floor of the house, an act which was received with hearty cheers by the members and the spectators in the galleries. The omission by the Czar of any promise of amnesty for political offences created the greatest disappointment, and the peasant delegates were eager to have the President at once visit the Czar with a demand for the liberation of those who had sacrificed themselves to secure the rights that the people were now permitted to exercise. The Constitutional Democrats, however, effected a compromise with the peasants by making the amnesty question the first in the reply to the speech from the Throne. To prepare this a committee of eleven was appointed, on which the Poles, Jews and peasants were represented. With the exception of 40 very radical members, the peasant delegates are voting with the Constitutional Democrats, and a test vote for the two Vice-Presidents of the Chamber showed a majority of 361 out of 428. The peasants are evidently tremendously in earnest. They voted against a recess for dinner, and a holiday on Sundays because of the need of haste. Many of them wear the peasant costume of colored smock and high boots, on all occasions, and 122 refused to attend the banquet given in honor of the Duma by the City Council because they did not approve of the expenditure of so much money, \$3,500, when the poor were starving. The Duma adjourned on the 14th, the Russian May Day. The reply to the speech from the throne now before the Duma makes the following demands:

(1) General amnesty. (2) The abolition of the death penalty. (3) The suspension of mar-

tial law and all exceptional laws. (4) Full civil liberty. (5) The abolition of the Council of the Empire. (6) The revision of the fundamental law. (7) The establishment of the responsibility of ministers. (8) The right of interpellation. (9) Forced expropriation of land. (10) Guarantees of the rights of trades unions.

—Vice-Admiral Kusmitch, commandant of the port of St. Petersburg, was stabbed in the back by a workman, and a police captain in Warsaw was slain by a bomb. The report of the assassination of Count Ignatieff is denied.

**The Council of the Empire** The upper house of the Russian Parliament, the Council of the Empire, met at the same time as the Duma, but with much more pomp and ceremony. Half of this body is appointed by the Czar, and it consists chiefly of members of the aristocracy and Government officials. The only members not in uniform or wearing decorations were the Liberal professors, who will work for the abolition of the body of which they are members. Count Witte's appearance in the Council as a working member created much surprise, as his name had been omitted, either by accident or as a slight, from the list announced the day before. He and Mr. Manuklin, former Minister of Justice, had been appointed by a special ukase. Professor Bagaley proposed that the Council begin by expressing its intention to work in harmony with the Duma, and that they suggest to the Emperor that it was a fitting occasion for amnesty, praying that his manifestation of mercy be limited only by the greatness of his heart. Dmitri Shipoff, representative of the Moscow zemstvo, advocated including in the reply to the speech from the throne, a request that the Emperor revoke the fundamental law, limiting the scope of the Duma, which he promulgated just before it assembled. Ex-Premier Witte approved of the proposition of Professor Bagaley, but held that it was not proper for the Council to make such a recommendation to the Sovereign as that advocated by Shipoff. He made a long speech in explanation of his official acts, admitting that he had been compelled by the force of circumstances to do things of which he disapproved.

**Peace Proposals in the British Parliament**

Mr. Henry Vivian, Labor member from Birkenhead, introduced a resolution into the House of Commons declaring that it was the opinion of the House that the growth of expenditure for armaments was excessive, and calling upon the Government to take drastic steps to reduce the drain on the national income and to press for the inclusion of the question of the reduction of armament by international agreement in the program of The Hague Conference. Mr. Carlyon Bellairs, Liberal, held that the only hope of stopping the present mad race was an Anglo-American alliance. These two Powers, he said, could guarantee each other against attack and could both reduce their armament. He moved an amendment to the last part of Mr. Vivian's resolution to the effect that British naval supremacy must be maintained, and it was inadvisable for the Government to initiate a discussion concerning the armaments which foreign Powers deem necessary for the defence of their territories. Sir Edward Grey, Foreign Secretary, said that in behalf of the Government he welcomed Mr. Vivian's resolution. The Hague Conference could do no greater service to the world than to make the conditions of peace less expensive. There were certain offsets to the horrors of war, he said, but there was nothing to offset the expenditure for war, which remained a dead weight, lowering national life and the standard of a country's vitality long after the excitement and passion of conflict were over. Indeed, in a sense that depression of vitality was perpetual in Europe, owing to the enormous expenditure for armies and navies, altho peace was not broken. The nations were all waiting for each other to take the first step in reducing. Somebody must do it some day. He opposed the amendment of Mr. Bellairs on the ground that Great Britain ought not to be precluded from taking the initiative in favor of a reduction in armaments. The resolution was passed with cheers. —The Education Bill on its second reading was hotly discussed on the lines we have previously given in this "Survey." The Irish members united with the Conservatives in opposing the bill on

the ground that it would extinguish the Catholic character of their schools. Twenty-two hostile amendments had been prepared, but after discussion the bill passed its second reading by a vote of 410 to 204 and was referred to a committee.

**Austro-Hungarian Politics**

The Hungarian election passed off peacefully, and at last Hungary is to have a government legally and properly supported by a majority in the Chamber of Deputies. The Independence party, whose leaders—Count Andrassy, Count Apponyi, Herr Polonyi and Francis Kossuth—are in the Wekerle Cabinet, will have a majority in the new Cabinet over all other parties. The Liberal party, under Count Stephan Tisza, which for thirty-nine years was in power in Hungary, dissolved just before the election. Of the 413 seats in the Chamber the Independence party will have 240, the Constitutional (Andrassy) party 74, and the Clericals 30. A new factor and one that will offer some embarrassment to the dominant party, is the non-Magyar group, which consists of 38 members—Saxons, Rumanes, Slovaks and Serbs. —In Austria Premier Gautsch von Frankenthurn was obliged to resign because he found it impossible to carry thru the Government project for general suffrage. All parties are willing to agree to it except the Poles, who insist that suffrage reform gains go hand in hand with the extension of the provincial self-government, and demanded for Galicia 110 representatives. Prince Conrad zu Hohenlohe Schillingsfürst, Governor of Trieste, will endeavor to form a new Cabinet. Altho the new Premier is only forty-two years old, he has had great experience in executive work, and is very popular on account of his Liberal sympathies.

**Turkey Yields to England**

In accordance with its usual policy the Porte held out till the last moment against the demands of Great Britain for the delimitation of the boundary between Egypt and Turkey by a joint commission, and the evacuation of Taba by the Turkish troops during the negotiations. The rapid assembling of

the British Mediterranean fleet at Phalerum Bay, under the command of Vice-Admiral Sir Charles Beresford, convinced the Sultan that Great Britain was really in earnest, and that in case he delayed action beyond the ten days allowed by the British ultimatum, expiring Sunday, the 13th, there was danger that one of his cities would be bombarded or a few islands seized. On Friday a note was sent to Sir Nicholas R. O'Connor, the British Ambassador at Constantinople, announcing that Turkey was willing to comply with some of the demands of Great Britain. Ambassador O'Connor, however, insisted upon an unconditional surrender, and on Sunday night received a communication informing him that Turkey would comply on all points. Accordingly the Turkish troops have been withdrawn from the port of Taba, and the boundary line will be located by a joint commission of English and Turkish appointees. The boundary will run from Rafah in a southeastern direction to a point not less than three miles from Akaba. The effect of the incident has been to strengthen in the eyes of the world the dominance of Great Britain in Egypt, since it is apparent that no one of the Powers, not even Germany, is prepared to back Turkey in a contest with England. Since the boundary commission will not be international in its membership and will not even contain an Egyptian representative, it involves a decided recognition of Great Britain's sole responsibility over Egypt. It is reported also that Great Britain will demand the recall of the Turkish Commissioner at Cairo, Ghazi Ahmet Moukhtar Pasha, who is considered responsible for the anti-British agitation in Egypt. The British Government will probably fortify El Arish on the Mediterranean, and place Egyptian garrisons along the boundary on the desert routes. Turkey has come into conflict with Germany over the boarding and detention of the German ship "Odysseus" while discharging a cargo of benzine on the Bosphorus. The Turkish officials searched the ship, suspecting she was carrying explosives. The German Government demanded an apology, the punishment of the officials and an indemnity of \$3,500 on the ground that the seizure of the

"Odysseus" was an act of piracy. The Porte has apologized, promised the punishment of the officials, but asks for a reduction of the indemnity.

#### The Zulu War

The rebel chief Bambaata is receiving accessions from the disaffected natives in many districts. In order to prevent Chief Kula from joining in the revolt he was arrested and imprisoned in Pietermaritzburg, but a war party of several thousand from his kraal have gone to join Bambaata, who is reported to have crossed into Natal. The Natalian troops, under Major Murray Smith, had a fight with Kula's tribe, in which the rebels were beaten with a loss of thirty. An efficient weapon of a punitive force is the searchlight, which the Zulus regard as a new and potent witchcraft of the whites. The natives, on their side, are resorting to a witchcraft of their own for protection, and the witchcraft doctors are reported to be sacrificing children for the purpose of concocting medicine with which to anoint the warriors to render them invulnerable. The outbreak is said to have been forced against the judgment of the elders of the tribe by the young men, who were anxious for a war in which they could display their valor, as a young Zulu is not able to marry until he has killed an enemy. The Premier of Cape Colony has offered the Natal Government a mule battery of six Maxim guns, fully equipped and manned, free of all cost to Natal. The Transvaal has also offered assistance and so has the general commanding the Imperial forces in South Africa. The Governor of Natal, while cordially thanking the neighboring colonies for these offers, declares himself convinced that the Natal troops are sufficiently strong to put down the rising. A battalion of Imperial troops has been sent to Pietermaritzburg at the request of Natal for the purpose of impressing the natives with the fact that Great Britain would support the colony in case of need. The Natalians are, however, very unwilling to call upon the British Government for any considerable assistance unless absolutely necessary, because of their resentment at the recent interference of the British Government with the execution of twelve native rebels.

# Is "The Jungle" True?

BY UPTON SINCLAIR

["The Jungle" is to be considered not merely as one of the most popular novels of the day, but as raising an issue of national importance. President Roosevelt was so impressed with the book that he sent for Mr. Sinclair to come to Washington and give in person his evidence as to the conditions in the Chicago Stock Yards. The President has since sent as his personal commissioners, Charles P. Neill, Commissioner of Labor and James B. Reynolds, to investigate the situation, and their report will shortly be published, which is likely to result in Government action.—EDITOR.]

"THE question is," says THE INDEPENDENT reviewer, "how seriously shall we take this story of life in the packing house district of Chicago?" That seems to be the question with a great many people. For the past year, ever since the story began appearing serially, I have been receiving half a dozen letters a day, asking it; so that if a public answer serves no other purpose, it will at least help to lighten the burden of my mail.

"Of all the recent literature of exposure," says the New York *American*, "'The Jungle' is at once the most astounding and the most convincing. It rings with truth in every paragraph." On the other hand, the Chicago *Inter Ocean* thinks that it is "too hysterically sensational and furiously denunciatory." "Common sense should tell the reader," the review continues, "that conditions in the world's chief source of meat supply cannot be as 'The Jungle' portrays them." Perplexed between opinions such as these, people are writing me letters such as one I have received today from a Jewish clergyman in California: "I wish that I might know the truth about this. How is one to know it? Will you tell me yourself, what you believe about the book? Can it be that you think it is true? Can you assure me that it is true? If I can have your assurance, it will go a great way with me, because no man can read this book and fail to be convinced that you yourself are honest." My answer to this correspondent, and to all others, has been as follows: "I in-

tend 'The Jungle' to be an exact and faithful picture of conditions as they exist in Packingtown, Chicago. I mean it to be true, not merely in substance, but in detail, and in the smallest detail. It is as true as it should be if it were not a work of fiction at all, but a study by a sociologist; it is so true that students may go to it, as they would to a work of reference. I have exercised none of the ordinary privileges of the writer of fiction. I have imagined nothing, I have embellished nothing; I have simply dramatized and interpreted. In the portion of the book that deals with other parts of Chicago I have invented several incidents, such as the story of how Jurgis loses the hundred-dollar bill, and how he gets into the millionaire's palace—the artistic purpose of which is evident to any one; but in the earliest portions of the book, which deal with conditions in Packingtown, I have not invented the smallest detail. Everything that has been there described has, to my own positive knowledge, happened to some one in that neighborhood. And likewise every fact or figure which I have given is absolutely accurate and exact, the result of patient inquiry and investigation. I spent seven weeks in the stockyards district alone, living with the people, meeting them in their homes, in the places where they worked, in their saloons and clubs. During that time I talked with hundreds of workingmen; I talked also with every other class of persons to be found in the district, with bosses and superintendents, with doctors and lawyers and merchants,

with saloon keepers and policemen, clergymen and criminals. Everywhere I took note of what they said, testing the statements of one by those of another, and verifying every minutest detail; and afterward, when I came home, I kept up a continual correspondence with many people in Packingtown—in cases which I could name I wrote several letters in order to make sure of a single statement which I was making in the story. So I am not disturbed when people who know nothing whatever about Packingtown declare, either in reviews or in conversation, that the book “cannot be true.” I know that every honest man who takes the trouble to go out there and investigate will find that it *is* true, and true in every sense of the word. Among the (literally) thousands of letters that have come to me about this book, and the hundreds of reviews which have been written, I have been impeached upon but one single *fact*: That fact was that I made my immigrants pay \$8.40 interest instead of \$7, as it should have been: An error due to a miscalculation, and that not a miscalculation of my own, for I wrote the figures exactly as they were given to me by one of the agents who rented houses upon the plan which I have described. The blunder being his, and one that he might just as readily have made in a real transaction, my helpless immigrants might quite possibly have had to pay the larger amount after all.

As a writer of fiction I could be required to be true only in the way of art, and not in the way of a newspaper; but, as it happened, I was able to be true in both ways, and the book might as well have the credit for it. Therefore, let me show in detail exactly what I mean when I say that “The Jungle” is as true as a work of reference. I will take up some of the questions that have been propounded by my correspondents. A woman writes to ask me whether there can be any truth in my picture of the midwife in Packingtown and of the horrors which she perpetrated. I answered: “Upon one mile of a single avenue in Packingtown, Ashland avenue between Forty-seventh and Fifty-fifth streets, I counted over forty physicians; and I talked with one of them, a Polish doctor,

and one statement which he made to me I remember as follows: ‘I have been practising for thirteen years in this district, and during that time never a week has passed that I have not been called in to two or three cases of women who have been mangled and mutilated by midwives.’” Again, Jack London, referring to the book in the course of a speech, was challenged by a man in the audience who said it was absurd to represent a child as being drowned in the streets of Packingtown; and London replied: “I myself, while in Chicago, talked with a settlement worker who buried that child.” I, for my part, had clipped the incident from a Chicago newspaper; as I also did the one concerning the little boy who was locked in an oil factory at night and devoured by rats. To take another case, in the course of my story, I described a certain “forelady” who ran her department in connection with a house of prostitution downtown. Any one who knows anything about the yards knows that this sort of thing is common, but I had no particular forelady in mind. However, in a report upon “The Jungle,” prepared by the legal department of Armour & Co. (which I had the pleasure of reading) I found that they took it for granted that I had in mind a certain particular forelady in their establishment; and only the other day I met a man who had been, for twelve years, a superintendent with Armour & Co., and who thought the same thing, and wondered how I had managed to get the details so exact. One of the curious things in connection with “The Jungle” is that I keep learning new facts continually, and they are always valuable. If I had met this superintendent before I wrote the story I could have made it a great deal blacker than it is at present.

Tho I meant to tell the truth, and to tell it relentlessly, and without in any way considering conventions or proprieties, I must confess that I should have shrunk from picturing the facts which I described in the casual conversation of this man.

All the facts which I put into the book I obtained from persons who were qualified to know about them; the medical facts were given to me by physicians,

the political facts by politicians, and the conditions in the different departments by the men who worked there. The whole story of the buying of the house was outlined for me by a man who had been in the business for many years. The little intimate details of stock yards graft were narrated to me by men who had been, or still were, members of the Wati-ta League — the "War - Whoop League" of "The Jungle." The diverting stories of election procedures were narrated to me by a man who had himself voted seven times at one election, and who had become a regularly enrolled citizen of America when he was only three months out from Bohemia. The exact description of the treatment of newly arrested criminals were all written down for me by a young physician who had been put in jail for practicing without the license, which had been refused him because he would not pay graft. And all this, of course, leaves out of consideration the things which I saw with my own eyes, by far the greater portion of what I have described. For I went among the packing houses, and into every corner of them, from the roof to the cellar. Being a contributor to the *Appeal to Reason* and other Socialist papers widely circulated in Packingtown, I was intimately known to many of the men in yards; and they took me in charge and introduced me to their friends, and I was passed from hand to hand and shown everything that I wanted to see. One man left his work altogether for three days, and having lived and worked in the district all his life, and knowing all the watchmen and spotters by their first names, he would introduce me, and start up a conversation about family affairs, while he piloted me into places where strangers had seldom come before. In this way I saw the rendering of condemned hogs into lard; in this way I saw the doctoring of spoiled hams with chemicals pumped thru a hollow needle; in this way I saw the rooms where sausage meat is stored, where the rats run about and poisoned rats are shoveled up by the men and dumped into the hoppers—and, by the way, this incident of the rats is one upon which I was challenged, by a person who was supposed to know; and as I was dissatisfied

with my own evidence I commissioned a friend to make inquiries for me, and learned that these storerooms had been cleared out for use as lodging houses during the strike, and that after the men had dined there and thrown scraps of food upon the floor, the rats would come for the food in the day time, and were so thick at night that the men would have to put their cots up on top of the tables in order to sleep. Also I learned that there is a new place now being built by one of the packers, who is determined to keep rats out of his storerooms, and is building his walls with iron sheeting upon each side, and layers of concrete next, and a packing of cinders in the center. I might add that all these precautions do not mean that conditions are being reformed, but simply that the rats get into the chilling rooms, where the carcasses for export are stored, and they eat into the carcass and all the way down the tenderloin, thus ruining many hundreds of pounds of prime beef at one meal.

I have explained in "The Jungle" the whole system of graft in the use of condemned meat for food; and perhaps it is about this that the reader is most anxious to know. I have been getting my evidence together, but I cannot even outline it in an article of this length. Suffice it to say that it contains no allegations of my own, but consists of affidavits and court testimony, of chemists' analyses, and the signed declarations of persons of responsibility and authority: all proving my assertion that hundreds of millions of pounds of diseased and tainted meat are sold to the American people every year; that our national system of inspection is a farce, maintained for the packers' benefit, and paid for by the people of the United States in order to certify to the governments of Europe that no diseased meat is sent there; also that the Government inspector is without authority to follow meat after it has passed the post mortem examination, and that there is no provision in our law to prevent the greater number of the abuses which I have described in "The Jungle": the doctoring of spoiled ham, the re-grinding of old sausage, and the use of "everything in the pig but the squeal"—including the gullet and the stomach to

make "deviled ham," and the skin to make "headcheese." I can say no more about this evidence at present, except that it will constitute itself a challenge to the honor and manhood of every newspaper reviewer who has said that "The Jungle" is not true.

I come back again to the question of the things which I saw with my own eyes. No one who knows anything about literature will need to be told that I saw the wedding feast with my own eyes. It was about four o'clock one Sunday afternoon. I had been over to inspect Tom Carey's dump, and had narrowly escaped a clubbing at the hands of a policeman who had been posted there for the express purpose of preventing what I attempted—the taking of a photograph of it. I noticed a crowd in front of a saloon, and I pushed my way in, and behold, there was the opening scene of my story, a gift from the gods. I stayed there until seven o'clock; and then I went away and had a little supper, and returned and stayed there until two o'clock in the morning. My habit of working is such that I can carry long scenes about in my memory for days, and then write them down word for word; I seldom write anything about which I really care without having done this for a long period. So I sat there and wrote that whole chapter in my mind—every tiniest detail of it and every emotion of it; I watched the people there and imagined their lives, and little by little the whole story took shape. Everything which I had previously planned seemed in some miraculous way to fit in with them, and when I came away I was so exhausted that I could scarcely walk, but I knew that I had my whole book. That was two years ago, yet even now I cannot hear a child whistle "In the Good Old Summer-time," without feeling the tears start into my eyes.

I have nearly got over the emotions of it now, thank heaven! During the time that I was actually in Packingtown it used to make me ill; I would go into the settlement to supper, and the people would remark that I was as white as a sheet. It was not merely the sights of human degradation and misery, it was not even the physical horror, the stenches and the blood; it was a spiritual thing—

it was the sight of tyranny and oppression. The Beef Trust is a thing which presents itself to my imagination as a huge castle, a fortress of knavery and fraud. It towered above me, insolent and triumphant, mocking at all opposition; and I was poor, and alone, and helpless, with nothing but my cry of anguish.

That is the way everybody comes to feel who knows anything about Packingtown; and when they try to put it in words, the public says that they are hysterical, and unreliable as witnesses. For instance, I asked Robert Hunter to write me his opinion of "The Jungle," and this is the way he replied:

"Having lived for three years in that hell called the Chicago Stock Yards, I can say that you have given a full and true picture of the life in that community."

And in the same way, John Burns, when he was in America, declared that Packingtown was "a pocket edition of hell," and later modified his statement by saying that hell was "a pocket edition of Packingtown." A few weeks ago there came a letter from the Rev. Artemas Jean Haynes, who said that he had been for three years the pastor of Mr. Armour's own church in Chicago, and I said, "Now, at last, I shall be given a calm and dispassionate opinion of 'The Jungle,' by a man who knows." And here is the opinion:

"It seems to me that I have a certain concrete right to speak, for in some ways I have been closer to the sheer deviltry of the thing than even yourself. Men will say that you have overdrawn the thing; it is not so. Words utterly fail and break down in the attempt to tell the story. Terrible as is 'The Jungle,' it falls far short of the awful reality. You had the novelist's rights, of course, but you have not misused them. Your book is true—true as life—true as death. Men who do not know should keep still. Men who do know and deny it are liars. Men who know and say nothing are cowards. I hope the men who will hate this book will speak out. What we want is the naked truth!"

There is another class of critics, who grant the existence of the facts as I have described them, but who say that I have erred in my interpretation. They admit all the misery and the hunger, the heat and the cold, the filth and the stench, the disease and accident, and death; but they say that the people who live among these

things have grown used to them, and do not mind them, and feel none of the emotions which my poetic imagination has attributed to them. Here is the reviewer of the *Louisville Post*, for instance, who thinks that

"One of the strangest and most aggravating things in literature is the effort of novelists to put themselves in the places of other people. . . . The point is that neither Mr. Upton Sinclair nor any other man of his type is going to feel as the man in the slaughter house. What we want is a book from that man himself—written with his own blood, telling his own tale. He will speak with authority—and we shall believe him as we cannot believe any other."

Now let me point out to this reviewer that, counting from the age of twelve, when many of the stockyards children go to work, I have been fifteen years getting the education to enable me to write "The Jungle." During twelve of those years I have actually been practicing at writing, and during that time I have written certainly not less than five million words. During the same time I have read certainly four or five thousand books, including all the worth while novels in the five languages which I succeeded in acquiring during the same period. To enable me to write the first chapter, I had to spend nearly three years studying the violin, and to attend many hundreds of concerts. To enable me to write other portions of it, I had to get married and become a father. The cost of the whole equipment could certainly not have been less than \$20,000; and including the labor incidental to the earning (or borrowing) of this sum, it took sixteen hours a day during the whole of the twelve years period described. And, finally, I spent two years in writing the book, and came out of it more dead than alive—so close to being a nervous wreck that I shudder whenever

I think of it; and now the glib reviewer surveys the product, and with one breath rebukes me for the one obvious fault which the book contains, and in the next breath finds fault with me because I am not a stockyard worker, and, therefore, cannot possibly know how stockyard workers feel!

No, the two things do not go together, and it is mere folly to talk of their going together. There are thousands of men in the stockyards who feel as I felt while writing "The Jungle." But their knowledge is of no avail, for they cannot write novels; if they have ever written anything at all it has been some pitiful cry which has appeared in some obscure socialist newspaper, and was never heard of by any interviewer. On the other hand, there are many men who know how to construct a novel better than "The Jungle" is constructed; but they do not know anything about the stockyards workers, and they do not care to know. The people of Packingtown had to wait for their deliverance upon the strange coincidence of a novelist who had all the training which the schools could give him, but was so bent upon writing things which the world did not want to read that he was willing for himself and his whole family to descend into the social pit and to experience all the degradation, physical, mental, and moral, of the wage-slaves of the stockyards; and who then had left enough strength and iron resolve to gather himself together, and stake his life upon the final cast, and put it all into a book into "one terrible heart-rending, menacing cry, materialized in black and white, the anguish of a great multitude made articulate!" I quote the words from the review of *Life*, which seems to me to cover the case.

PRINCETON, N. J.

# Personal Impressions of Luther Burbank

BY HUGO DE VRIES, Sc.D.

[The meeting of Hugo De Vries, Professor of Botany in the University of Amsterdam, and Luther Burbank is of peculiar interest because the two men are working in the same line, yet differ so widely in their methods and aims. Both are engaged in creating new species of plants, but Professor De Vries's sole purpose is the discovery of the scientific laws of growth, while Mr. Burbank's aims are practical and commercial. We published some time ago from Professor De Vries an account of his experiments on primroses, carried on in the University of Amsterdam, which were the foundation of his mutation theory of evolution, the most important extension that the theory has received since Darwin.—EDITOR.]

THE significance of ameliorations in horticultural and agricultural plants can hardly be overestimated. It seems quite possible to breed a new wheat, barley, oats or corn, which would produce one grain more to each head or a variety of potatoes which would surpass the ordinary kinds by one tuber to each plant, or a tree with one apple, pear or nut more on its branches.

The results of such apparently slight changes can easily be calculated. Without effort and without cost such corn would produce annually, in the United States, 5,200,000 extra bushels, wheat 15,000,000 bushels, oats 20,000,000 bushels, barley 1,500,000 bushels and potatoes 21,000,000 bushels more than the varieties cultivated at present. Year after year these benefits would fall into the lap of the agriculturist, not only of this country, but everywhere on the earth, where the ameliorated varieties could be cultivated. Who can estimate the influences which such improvements could have on society at large? They would be felt in all classes of the population, and even by those who were not aware of their immediate causes.

Besides the increase of wealth by the culture of ameliorated useful plants, the same principles could be applied to flowers, with their graceful forms and bewitching shades and combinations of colors and exquisitely varied perfumes.

Thus for many men life would be brightened as well as bettered. The earth would be transformed, man's thoughts turned from the base destructive forces into nobler productive ones which will lift him to higher planes of action.

Such are Burbank's ideals; such is the aim of his work. A single instance may suffice to show that his results are equivalent to his conceptions. His very first contribution to the wealth of the United States was a new potato, which now bears his name. According to an official statement of the United States Department of Agriculture at Washington, made a few years ago, this Burbank potato is adding to the agricultural productivity of the country an annual amount of \$17,000,000. To convey an idea of the enormous number of Burbank potatoes, some one has calculated that if all the tubers produced in one year were arranged in a row, touching one another, the line would be thrice the distance between the earth and the moon.

Potatoes, however, are not his chief line of work. Neither do the grains or does the corn attract his attention. They have been improved by others, and are almost everywhere the object of much work and care in this direction. Among fruit trees, on the other hand, many valuable species have hardly been given any endeavors to improve them in the same way. Apples and pears, of

course, have to be excepted, but plums and many of the smaller kinds, such as brambles, have simply been left to themselves. The old types are cultivated everywhere, and the question, whether by the ordinary methods of hybridizing and selection, better and more yielding varieties could be won, has hardly ever been proposed.

Why should this be so? Simply on account of the idea that trees want so

bringing together from all continents and from all countries all the forms that might usefully be combined with the old types. When plums are to be ameliorated no species of the large genus should be left out of consideration. Types from foreign lands, or rare sorts, or long forgotten cultivated varieties may conceal characters that will prove to be the sources of desired ameliorations, or even, as in the case of the stoneless

Luther Burbank.

many years before the seedling may be judged by its fruits, and that selection is a slow process, requiring a large number of generations to produce remunerating results. The lifetime of one man would not suffice to gain any definite progress.

This, however, is not Burbank's principle. Try everything is his prescript; it holds good as well for living organisms as in the realm of electricity. He only adds: Try it on the largest possible scale,

prune, bring wonders which nobody could expect.

The man who fosters these ideals and who devotes his whole life to their realization lives in a little town of California, Santa Rosa, about fifty miles northerly from San Francisco. During the summer session of 1904 of the University of California I had the privilege of visiting him twice. The effects of heredity and environment on plants

had for years been the main subject of our studies, by Burbank, with the practical view of improving horticultural varieties and by myself in order to get a clearer insight into the processes by which species originate in nature. For some time I had had as lively a correspondence with him as our duties would permit, and in the summer of 1899 we had planned to meet at the Hybrid Conference of the Royal Horticultural Society at London. His experiments, however, did not allow so long an absence at that time of the year, and so he did not come, and I lost a precious chance of making his personal acquaintance.

Among the books which I had studied on behalf of the development of my views concerning the origin of species was Burbank's "New Creations in Fruits and Flowers" of 1893. It is partly a catalog for his customers, to be kept for reference, but, on the other hand, it is a treatise and guide for the breeder, and contains much valuable information for the scientist interested in the broad questions of evolution and hybridization. It is a representative of the new lines of work in plant improvement. Everybody knows that Darwin relied in his conceptions of the origin of species partly on the results of the agriculturists and partly on those of the horticulturists of his time. The latter information had been brought together, in three small pamphlets, by Carrière, Verlot and Vilmorin, and up to the present time the botanical student of Darwin's books appreciates these three booklets as the ultimate source of his information concerning horticultural evidence.

Burbank's "New Creations" are to be put on the same line with those fundamental and celebrated works. It is a book of reference, which provides to the scientist many valuable arguments for his conceptions. It will, in the long run, prove to be a foundation stone for many kinds of discussions, especially concerning the prospects and effects of hybridization.

Moreover, I had studied a series of articles, prepared by Edward J. Wickson, of the University of California, and published in the *Sunset Magazine*. They give an appreciation of the man, of his methods and his achievements. They

are, as far as I know, the most complete survey of his various experiments and as valuable for scientific as for practical purposes. They are only incomplete on the industrial side of the results, and definite statements concerning the magnitude of the services rendered by Burbank to American horticulture are difficult to obtain. Everybody knows the name of his new plums, as e. g. the Maynard plum, or the stoneless prune, the Primus berry, the spineless cactuses and the Shasta daisies. But in order to tell the exact amount of the value of these improvements extensive statistical inquiries would be necessary.

By these studies I was well prepared to enjoy my visit and to profit by it. But it is only fair to state that such a study is a definite requirement. Every one who wishes to visit Burbank should prepare himself thoroly, because only in this way he may have real profit of his trip and, moreover, enjoy the consciousness that his visit will not be a burden to his host. Hundreds of visitors are yearly going up to Santa Rosa to have a talk with him, and Burbank is kind enough to give at least some of his precious time to as many of them as his occupations will permit. But he enjoys your visit only when he perceives that your eyes are quick at the small differences by which he selects his new types. Visitors who expect to see long rows of beautiful plants will not find what they supposed, but instead will see a workshop, with its utter chaos of tools, the tools being the individual plants with their almost imperceptible differentiating marks. If you have no practice in the appreciation of such small differences don't try to pay him a compliment; your praise will miss its aim, because by the choice of the plant you mention he will instantly see how much you know about methods and results in plant breeding.

As long ago as 1893 Burbank described in his catalog how much he dreaded to be overwhelmed by an avalanche of visitors and of letters. Since that time his fame has steadily increased, and in the same measure the crowd of visitors is yearly increasing, but only those, who either come to buy his novelties, or who warmly sympathize with his work and his ideals are welcome. Price-

less hours are lost by the demands made upon him, priceless not only for himself but also for humanity, which profits by his work.

Many times Burbank has been urged to write regarding his work, and volumes could be written on the wonderful display of life-forces in plants and the astonishing results obtained by his experiments. But he prefers the work itself to its record, and the practical achievements to their theoretical description and discussion. He is no author, and in his conversation, after having clearly exposed the facts, readily indulges in speculations of a poetical nature, thereby discovering the wealth of life-enjoyment which the intercourse with the living children of nature affords to the student, and which is his principal reward for his labors. Burbank is a man who takes knowledge seriously and enjoys it, who, believing in the truth of human experience, trusts his life to it, and has the courage to use it in his business. His method is simplicity itself. Every one can do the same things in his garden. Selection is the choice of the best and the destruction of the others; nature does the rest. But you have to arrange the conditions, and this is one of the finest of all arts. It is the work of the genius, and the heaping up of unexpected results is a favor, which nature throws only in the lap of very few men. The commercial as well as the scientific value of Burbank's work is great, and can hardly be overestimated.

In person, Burbank is slender, almost to frailness. It is now nearly thirty years ago that he came to California from Massachusetts, where he was born. He is about sixty years of age. He is a tireless worker, spending many hours each day at his experimental grounds. The finer experiments he conducts at Santa Rosa, on the farm where he lives, but he owns other grounds in the neighborhood, at Sebastopol, where his larger cultures are to be found. Twice a week he mounts his bicycle and rides to this larger farm in order to inspect the plants and to make the necessary selections. His house is a little cottage, where he lives with his old mother, a lady of about ninety. It is approached thru closely trimmed box borders, which remind us

of old-fashioned New England gardening, and is to be considered as a reminiscence of his youth. Contiguous to the house are some greenhouses and sheds and the other necessary buildings for the work of the farm. But there are no elaborate appliances for research, because the instruments for his work are of the most simple construction. His hands and his eyes and his brains are his instruments, and he hardly needs any other, except the most ordinary garden tools. We saw the wooden boxes for the sowing and the replanting of the small seedlings, the sieves for purifying the seeds and some other contrivances which interested us.

In 1878 Burbank purchased a tract of four acres near Santa Rosa, and upon it he maintained his residence and business headquarters until the present time. Thirty years ago it was waste ground, grown all over with wild oats and other useless plants. The soil was very fertile and the grasses were so tall as to overreach a man's height. He had the ground cleared up and planted with orchard trees. He began his business as an ordinary gardener, cultivating fruit trees, shrubs and flowers for sale. In the beginning he had a big nursery, and won money enough to increase his business rapidly. But he preferred the improvement of his varieties and the production of new ones to the more advantageous multiplication of the ordinary sorts, and as soon as his means allowed, he sold his nursery and limited himself to the study of his choice. He now sells only novelties, and leaves their multiplication for trade to other men. For some of these novelties large companies have been founded, since from the one seedling which Burbank won and sold, hundreds of thousands of trees have to be produced, before the novelty can advantageously be brought into trade. This long but profitable work he wholly abandons to others, keeping for himself only the more difficult, more arduous and more hazardous part of the task. The making of money may stimulate others, the gratifying feeling of contributing to the wealth and the happiness of the nations is the real stimulus of the genius.

On my first visit to Burbank I was in the company of two renowned scientists,

Professor Arrhenius, of Stockholm, and Professor Loeb, of the University of California, and of two special friends of our host, Professor Wickson and Professor Osterout, both of the same university. It was on a Saturday evening of July, 1904. He had finished his work of the week and kept the evening and the next Sunday free for us. We sat down in a circle, talking of ordinary topics. But gradually Burbank pushed

previous century were wont to adorn the walls of their rooms by ears and culms, choosing those which might best represent the ancestors of their pedigree-cultures, so here we saw all along the walls numerous specimens, photographs and drawings, illustrating the principal phases of our host's work. The photographs and drawings, partly taken from his catalogs, were grouped according to the subjects they represented and framed.

Home of Luther Burbank at Santa Rosa, California.

his chair into the middle, assuming the lead of the conversation. He began to talk of his experiences and his ideals. We, of course, kept quiet, answering and asking just enough to keep up his interest and to direct his discussions to the questions, which connected his work with our own studies. In outward appearance he is a plain man, more a gardener than a savant, with clear blue sparkling eyes, full of life and fun, appreciating humor in others, telling us stories that kept us constantly laughing. Even as the celebrated originators of new cereals of the

Each time, when a special group was discussed, his sister, who lives with him, took the corresponding frame from the wall and placed it on his lap. Then he would point out the pictures, telling all about them and recovering from his memory the whole history of the experiments of which they reminded him. Gradually complete sketches of the life-history of many of his pedigree-stocks were exposed to us. We easily followed him thru the most intricate experiments, the combination of pairs of species by means of crosses, the repeated cross of

hybrids and the extension of the range of forms until all the valuable qualities of some six or perhaps eight different kinds were combined in one single plant. His eyes were glowing with the love of his plants, many of which he remembers, individually, even from remote years. He treats them like children, tries to penetrate into their peculiarities and easily discerns the profits which may be derived from each of them for the improvement of the main strain. He estimates their differences and tests their qualities so easily, that it would seem that hardly any difficulty were to be surmounted. But from time to time he would point out two pictures, almost alike, and ask us to tell him in which respects they differed. Then we became aware of the amount of special study required for the solution of his problems. Ordinary people may recognize the tree by its fruits, he knows the fruit from the simple inspection of the tree. He has studied the correlations between the characters of the leaves and the qualities of the fruits, so as to be able to select among seedlings, even in their first summer those which will probably produce the finest aroma or be the richest yielders. By this means he is enabled to reject the large majority of individuals of minor or average value. Thus he can make his selections from among hundreds of thousands of hybrids, without having to cultivate all of them during the years required to reach the age of maturity.

He is especially proud of some of his first crosses, and among these of a hybrid of the English and the Californian black walnut. Along the road, before his house, six large trees of this beautiful variety are growing, and their imposing size at once shows their prevailing character. It is the great rapidity of their development, a quality in which they surpass almost all other kinds of trees in California, altho this State is renowned for the celerity of the growth of its trees and shrubs. These hybrids are ornamental trees of remarkable value, but almost devoid of fruits. Only in later years Burbank has succeeded in getting fruits from them, and from these he is now trying to win a new improved race.

This culture he showed us the next morning, when we returned to inspect his farm. Long rows of young walnut seedlings, containing hundreds of single plants, were growing on a nursery bed. No two of them were exactly alike, and the extremes were widely different from one another. He explained to us the characters of the leaves. Some were nearly simple, others richly divided. Some plants were fast growers, others being still very small. The margin of the leaflets, the colors of their tissue and many other marks were easily appreciated, as he slowly and clearly pointed them out. But the relations of all these qualities to the nature of the fruits and the future yielding properties remained a secret for us, inasmuch as such knowledge can only be gathered from a long and intimate intercourse with the fruiting trees.

All around this bed others were seen, full of the materials for his numerous selections. Berries and flowers formed the main part, the plums and other fruit trees having already been transported to his larger farm at Sebastopol. Some kinds of flowers are his special darlings. He wants to improve them in various directions. Partly in order to make them brighter and richer, extending their blooming period over a larger season, and partly to make them cheaper, so as to bring them within reach even of the poorest people. To adorn the homes of the poor by a profusion of flowers, larger and more beautiful than those which are now seen in the conservatories of the rich, is one of his most petted ideals. His Shasta daisies are large enough to cover your whole hand, and month after month the plants are covered with dozens of these bright white stars. He selects his bulbs, such as *Amaryllis* and *Gladiolus*, not only on account of their flowers, but principally according to the number of the young side bulbs, which they may produce in the course of a year. For this quality of rapid multiplication is the standard of the price which the bulbs will have in commerce. He showed us some *Amaryllis* with from twelve to twenty side bulbs, rejoicing in the idea that these plants, with their glorious flowers, would afterward be sold for perhaps one cent apiece. To these low

prices he wants to add the aptitude of growing in the open air, because glass-houses and conservatories are not to be found around the dwellings of those whose lives he hopes to be able to cheer up with his new, bright and cheap flowers.

Altho no Californian by birth, he has a profound liking for the children of its fields and woods. Whenever the duties of his experiments will allow him, he will stroll into the free and watch the flowers and the bees. As soon as he discovers a type which is new to him, because it excels in some attractive quality, he will take the plant or its seeds and transport it into his garden. Wild flowers, as a rule, are not exactly the same in different localities, altho belonging to one systematical species. So he will bring home the best specimens of the different forms of one type, and try to improve them by crossing. Numerous instances of this kind of work we saw all around his house, and he pointed them out with a perceptible delight. Among his older achievements in this line of work are many beautiful varieties of the tiger lilies, that tall and beautiful species which grows in so many forests of California, covering the ground in large groups or elegantly hanging from the sides of the boulders along the creeks.

From his home farm we drove to Sebastopol. Here are his larger cultures, the plums, the loquats, the brambles, the Californian currants, the aron-herbs and many others. It is impossible to describe all we saw. The number of the varieties is so large and their histories are so diverging that after two or three hours of continuous listening to his clear and fascinating explications, and of tasting a great variety of plums and berries, we became so absolutely tired that it was necessary to take some rest in and around the little office, which stands in the midst of the farm.

The most curious thing we saw was the stoneless prune. He pointed to some trees, heavily loaded with small plums, very attractive by their clear blue tinge. He asked us to bite right thru the middle of the plum. In complying with his request our astonishment was great, altho we knew beforehand what would be the result. Inside the plum the seed

is naked, not protected by its ordinary tough and woody shell. The uneatable stone, which is so disagreeable in ordinary plums, especially in the cling-stone varieties, was wholly absent. We could bite thru flesh and seed without meeting with any obstacle. On a closer search, here and there some remains of a stone were to be found, little hard cell groups, such as every one knows to occur in some kinds of pears. But the total impression was that of the absence of the stone, an improvement, the value of which can as yet hardly be realized. These stoneless prunes are not yet ready for trade; they have still to be improved by renewed crosses, in order to make them as big and as fleshy and as palatable as the best of the present sorts. As soon as this result will be obtained all of the numerous varieties of plums will be subjected to the same experiment. By crossing them with the stoneless form they may acquire this new character, without losing their typical distinctions. Stoneless prunes will then become as common and as highly appreciated as are now the seedless oranges of Southern California.

I asked Burbank by what methods he had contrived to bring about this notable achievement. His answer was as unexpected as simple. By studying the literature concerning prunes he had discovered that about two centuries ago in France a fruit had been known under the name of *prune sans noyau*. He had procured specimens of this now rare and almost forgotten variety, had crossed them with some of his best sorts, and thereby won the plums we now admired. He had simply followed the rule of finding out and trying everything, and thus produced this most astonishing result.

After an hour of rest he drove us back to the station, bade us a hearty farewell, and invited us to come back and to discuss the problems, which are the foundation as well of his practical work as of our theoretical inquiries. We left him with a definite plan of profiting by his kindness, much admiring his simple and open manners, his readiness to give us all the information we wanted, and, above all, the mighty array of his experiments, the benefits of which are soon to be those of humanity.

## The Four Continents, by French

THE new custom house, which is now being erected on Battery Park, in New York, is adorned with four groups of sculpture by Daniel Chester French, representing the continents of Europe, Asia, Africa and America. The groups are carved of American marble from the quarries of Tennessee, and the sculptor, who was born in Exeter, N. H., in 1850, is more distinctly American in his work than any of our other living sculptors. He was largely self-educated, and did not study in Europe until after he had made his reputation in this country by his "Minute Man," which he designed for the town of Concord in 1873.

The four groups of the continents presented on the following pages are characterized equally by boldness and effectiveness of outline, and carefulness in the execution of the symbolic detail.

America is represented by a figure full of activity, looking steadfastly forward, alert and ready for action, seated upon a rock with the torch of Liberty in her right hand and the American eagle by her side. Behind her, looking over the rock, stands an Indian, a sheaf of Indian corn lies across her lap, and under her feet is the head of a Mexican feathered serpent, the symbol of the Aztec sun god, Quetzalcohuatl. Her cloak falling from her shoulders is caught in her left hand and held protectingly over the figure of Progress, who, bending low, is setting a winged wheel in motion, and holds in his left hand a magnet and a prism, symbolic of the mutual aid which, in this country more than in any other, science and industry have given each other.

In marked contrast to the alert attitude of America is the sleeping figure of Africa. Like the others, this figure is not an ethnological portrait, but has a suggestion of the negro in the features, attitude, and the modeling of the hands and feet. The reclining figure of the dark continent is supported on the one side by the ancient and weather-worn

Sphinx, and on the other by a lion. In the background we glimpse a mysterious figure suggesting the unknown future possibilities of Africa.

Europe is a regal figure, proud, self-conscious, and steadfastly enthroned as befits the reigning queen of the world in commerce, art and literature. Her left arm is resting upon a book supported by a globe, and her right hand grasps the prow of a ship, emblematic of European dominance in maritime commerce. Her throne is decorated with reliefs from the Parthenon and her robe is embroidered with the arms of many nations. Upon her head she wears the crown of the city and behind her is the Roman Imperial eagle. Behind her, a little to the left, History is represented as an aged woman holding a skull with a laurel crown on it and poring over a scroll, while at her feet is a pile of the crowns of the nations which are passed.

The fourth of the groups represents Asia, the mysterious mother of all great religions of the world, with the passive and inscrutable face of the Far East. In her lap is the image of Buddha, the Light of Asia, and over her right shoulder shines the radiant cross of Christianity. Her right hand holds the Sacred Lotus, around which is wreathed a serpent and from her lap falls a scroll on which is pictured the Buddhist Wheel of Life. Her footstool rests upon the skulls of men, a suggestion from one of the legends of Buddha, which relates that when some one brought him a skull and remarked that he had found it on one of the surrounding hills, Buddha answered, "All Asia is made up of the bones of previous incarnations." The Asiatic tiger rounds off the group upon the right, and upon the left are three figures, a youth with his head bowed to the ground in prayer, a slave with his hands tied behind him, and a woman with an infant strapped on her back; which indicate three characteristics of Asiatic civilization—superstition, slavery, and the degradation of women,

# The Poets' Trade Union

BY ANDREW LANG

POETS, feeling a strong sense of their grievances, and desiring to be *dans le mouvement*, have recently organized themselves into a trade union. Being invited to join this body, I paid a visit to the secretary, Mr. Baunder, a gentleman of prosperous aspect, with a strong German accent. After explaining that I had never been in regular business as a poet, and that I was content, as a laborer in prose, with my membership of the Authors' Society, I learned from Mr. Baunder that the Society of Authors was of no service to poets. It might be very useful to writers on popular subjects, such as historians, archeologists, moralists, and the like, but its methods had done nothing to raise the wages of the toilers in poetry.

"Do you mean to tell me," I said, "that poetry is less popular than history?" "Much less," he replied, "the poets are remorselessly sweated; thousands of them cannot earn any wage at all, not to speak of 'a living wage.' A guinea for a sonnet; what do you think of that?"

I replied that, tho out of practice, I could write ten sonnets a day with ease. Mary, Queen of Scots, I added, had written twelve sonnets, in French, too, on a single night—at least, if she wrote them at all, only one night could be selected as the possible date of production (April 22, 1567). If Wordsworth had got a guinea for each of his sonnets, he could have set up his carriage.

Mr. Baunder said that was all very well in the dark ages. The name of a real queen on the title page of the "Six-

teenth Century" would have been a fortune to the editor and proprietor. He did not wonder that the Queen made sonnets, and made hay while the sun shone. Now things were different. Sonnets were a drug in the market, all poetry was a drug. The poetic labor market was overcrowded. Epics went, he might say, "for a song."

I remarked that things had been not much better in Milton's time. "Paradise Lost" went for £5 down, with a deferred royalty. "I do not wonder at it, sir," replied Mr. Baunder. "Mr. Milton missed his tip. Sunday reading was out, religious poetry was not called for. If Mr. Milton had written a spicy little comedy, now, with a singing part and page's costume for Miss Gwynne, he would have raked in the dollars."

"Then why do not your starving poets write spicy little comedies?"

"Well, sir, tho I would speak favorably of my employers, they have no sense of humor; Mr. Milton himself had not much. It is poetry or nothing with them."

"Is it good poetry?" I asked.

"Well, a man in my position cannot properly speak of 'good' or 'bad.' I dare say that a very good poet, if he knew Mr. — and Mr. —" (here he named two eminent critics) "and could get the 'Pantachaeum' and the 'British Pulpit' to take him up, might do very fairly, even now. But, as I look on it, poetry is a product of toil, like any other. We have no right to ask if it is good or bad; the man has put his time and work into it; the fever of the brow is the same,

whether you are a Shakespeare or the humblest of my members. They all tell me that they are inspired; they feel it, they say, and Shakespeare could do no more than feel it."

I thought myself that Shakespeare could do a good deal more, he could make you feel it, but I said nothing. What I said was, "But if nobody wants poetry, and you say that nobody does, how can the poets expect to live by producing what nobody wants?"

"That is an old fashioned way of looking at the matter," said Mr. Baunder, with an indulgent smile. "Poetry is the men's business, they can do nothing else; a demand must be stimulated by Government, must be made compulsory. I have drafted a bill making it compulsory for every man to buy a new volume of new poetry for every £20 of income that he has over £300 a year. Say a man has £2,000 a year, he has to buy 850 volumes of new poetry, this year's poetry—this year—at a uniform price, 6s. a volume."

"When that bill becomes law I shall write a good deal of poetry," I remarked.

"That is just the point, sir," said Mr. Baunder. "I can see you are a poet born; it is in your 'air."

His eye wandered to my locks, which, I admit, do excite suspicions.

"Do you remember what Alfred de Musset said, or was it Sainte-Beuve?" went on Mr. Baunder. "'In each of us there is a poet who died young.' And why does the poet in—well, not every one of us, not in me, if I know it—die young? Sir, because he is starved out of the business, starved, no market for his madrigals. Now, in you, sir, the poet was not quite starved out, and he'll come to the top of the journalist in you, when my bill passes."

I owned that this was so; and Mr. Baunder ecstatically cried, "Sir, when my bill passes England will be a nest of singing birds; Every man and woman will let their genius pipe up! What a happy isle we shall be. Lesbos, ancient Lesbos, was not so tuneful, and I believe the poetry market was pretty brisk there."

At this moment a poet bounced in with a grievance. After being introduced to me as a brother in Apollo, he gave it voice. "Look here," he said, "years ago a composer fellow whom I never heard of asked me if he might set a little thing of mine. I said he might, on the usual terms, whatever they might be. He said a guinea, and I gave it to a crossing sweeper, and forgot all about it. Well, will you believe it, that thing is still running, awfully popular, and I never knew it. I bar music. It's a four ball game; I mean a four voice song; here it is. Now did you ever see such nonsense as the man has made of it? The first verse really runs like this," and he recited it with feeling:

Only a spook at the window,  
Only a sprite on the spree,  
But the genuine ghost  
Of the lady I lost  
Will never come back to me.

"Now look how they have printed it:

Only a spook,  
Only a spook.  
Only a spook  
At the window, at the window,  
At the window!  
Only a —  
Only a spook.

"Mr. Baunder," he went on, "I know I can get no more money out of the man, but can't I stop the sale of this monstrous bosh?"

But Mr. Baunder murmured, "No, not yet; a time is coming."

LONDON, ENGLAND.

# Parliament in Its Easter Holidays

BY JUSTIN McCARTHY

THE Easter holidays have begun and the members of both Houses of Parliament have dispersed for their short vacation, carrying with them this time something to think about. That something is the new measure which has just been explained to the House of

own cost—England was until quite recently far behind many or most of the world's great civilized States. An eminent member of Parliament, writer and thinker, who died but lately, Sir M. E. Grant Duff, who had studied the question of national education very deeply,

Augustine Birrell.

Commons for the purpose of establishing a satisfactory system of public education thruout England. Now of all the vexed questions which have within recent times perplexed this country this is about the most vexatious. In the matter of public education—I am speaking now of education for the classes who cannot afford to obtain education at their

gave it to me as his conviction some years ago that as regards public education among European States Greece came first, Holland second, Prussia third, and that the remainder, including England, it was difficult to place in the order of succession, so poor were their relative claims. Since that time England, however, has been making strenu-

Miss Ellen Terry as Lady Cicely Wayneffete in Bernard Shaw's "Captain Brassbound's Conversion."

ous efforts to establish a system of public education which shall do something to unroll the ample page of knowledge to the children of the very poorest.

An American reader might perhaps be aroused into the expression of much surprise as to the difficulty which a great and wealthy State like England could have in establishing a system of national education which should provide for the wants of her very poorest classes. But the American reader will probably not have made allowance enough for the difficulty which the religious question brings into all efforts toward the establishment of a national educational system in England. I am not now speaking of Ireland or Scotland. There could be no difficulty in providing at a cost which the nation as a whole would hardly feel an ample and sufficing system of secular education. There would be no likelihood of any party feuds or passionate public controversies springing up with regard to the education of the poor in geography or grammar or arithmetic or even some of the perplexed problems of history. But our great trouble at present

in England is that among large and powerful sections and classes everywhere there is a strong objection to any system of national education which is purely secular and in which religious teaching does not make a part of the course.

Then there is, on the other hand, a large proportion of citizens who object to the introduction of any system of religious teaching founded and carried on by the State authorities at the expense of the taxpayers. This was the problem which had to be dealt with by Mr. Augustine Birrell, the new president of the Board of Education. Mr. Birrell is a man of great and universally acknowledged capacity. He is the author of "Obiter Dicta," one of the most brilliant and successful books of our later days; he has won distinction at the bar, and has been for several years one of the most ready, humorous and eloquent debaters in the House of Commons. Every one knew that Mr. Birrell, who is an advanced Liberal in politics, would be sure to have a place in the new Government, but somehow it was not generally assumed that that

The Late Dr. Richard Garnett.

place would be found for him in the trying office of Minister of Public Education. To that office, however, he was appointed, and I am sure that the best wishes of the public in general went with him in his difficult experiment, for Mr. Birrell is unquestionably a favorite among all who know him or know anything about him. One of the great tasks which the new Government had to undertake was the introduction of a measure of education which, it was hoped, might save the country from any further succession of those education schemes which have been harassing us for something like a generation. Mr. Birrell, I believe, set himself to work in a really hopeful spirit and with a confident expectation of being able to create a measure which might satisfy all the many parties in the educational controversy. The speech in which he introduced the measure was luminous and in many passages brilliant, and even its details of exposition were enlivened here and there by flashes of genuine wit and humor. But the progress of the measure was only in its first stage when Parliament broke up for the Easter holidays, and the disappearance of most public men from London has put the whole controversy aside for the present.

The most interesting and important part of Mr. Birrell's scheme is that which he has devoted to the hoped for settlement of the controversy concerning religious and secular education. The main differences in this dispute may be briefly set out. On the one side it is insisted that no system of public education can be accepted in which the teaching of religion does not form a recognized and indispensable part. On the other side it is contended that no system can be endured in which the doctrines of the various religious faiths are taught at the public expense. The members of the Church of Rome and of the Church of England hold alike firmly to the principle that religion must form a part of every system of national education, while the Non-conformist bodies as a whole maintain that each religious community must itself provide and pay for the teaching of its own faith. Mr. Birrell endeavors to meet these difficulties by arranging that religion shall be taught

at different hours to the scholars belonging to the different faiths, and that only the secular education shall be common and simultaneous.

I do not feel in the least inclined to venture on any expression of opinion as to the likelihood of Mr. Birrell's being able to bring the mind of the community into anything like agreement or into anything even like a satisfactory compromise on this long disturbing question. But I know it is a question which will have to be settled sometime or other and which will keep on perplexing and distracting governments until it is settled, and personally I should feel very glad if Mr. Birrell could discover the way to its settlement. Of course the Administration which he represents has an overwhelming majority, but then the great difficulty is in this instance that the followers of the Government are themselves divided into various parties on this particular subject. If Mr. Birrell can discover any means of reconciling on a scheme of national education the Church of England Liberals, the Liberal Nonconformists, the Irish National Party, and the Labor Party, he will have accomplished a great work for his country, and an enduring reputation for himself.

The world of books has suffered a severe loss by the death of Dr. Richard Garnett, who was for many years one of the most prominent of the officials entrusted with the care and arrangement of the British Museum. Dr. Garnett has only just died, and in last February he had passed into his seventy-second year. He came of a family of scholars and authors, scientific and literary, and he was himself the author of successful books in almost all orders of literature, tales, poems, biographies and translations, and, I believe, it cannot be doubted that he wrote some books, among others a treatise on astrology, to which he did not attach his name. Dr. Garnett appears to have been convinced that there was more to be said for the study of astrology than grave and learned personages would in general be likely to admit and it may be assumed, therefore, that he did not desire to impair the respect due to his public office by bringing on it thru himself a volcanic eruption of indignant criticism.

At one period of my life it was my good fortune to have many opportunities of meeting Dr. Garnett. He was then in charge of the great reading room of the British Museum, and I was a resident of that quarter of London of which the Museum is the center and the intellectual inspiration. It was and is an unfashionable quarter, but it was the favorite region of authors, artists and lovers of books, and it may be said to have had an atmosphere peculiar to itself and delightful to all of those who are born to breathe in it. I could pass hours, if I did not generally happen to have more pressing work to do, in recalling my memories of those dear old days when Dr. Garnett may be said to have been the central figure of that settlement of authors and painters and scholars and musicians. Many of those who were then only at the opening of their careers have since won distinction sure to last, while some who promised brightly then have since faded out of public notice and given up intellectual work and become to dull forgetfulness a prey, and others yet have passed out of this life altogether and are sadly ranked in the memory of those who knew them among the "might-have-beens." There used to be, at one time, a very popular song among English audiences which told us that "the star of Empire glitters in the West." The star of London's fashionable empire glittered always in the West, but for a long time the region of the British Museum seems able to maintain a distinct and powerful little empire of its own somewhat remote from that Western Hemisphere. I have not lived in the neighborhood of the British Museum for many years, chiefly because it was necessary for me to be in nearer touch with the House of Commons, but the place will ever have its hold on my memory, and when I read today of Dr. Garnett's death it seemed to me for the moment as if I must miss his figure in my ordinary daily walks. I need hardly say that the neighborhood of the British Museum is still and is ever likely to be a favorite stamping-ground of scholarship, literature, science and art.

We have been interested just at present here in the jubilee of Miss Ellen Terry's dramatic career, which commemorates the fiftieth anniversary of

her first appearance on the stage. Miss Terry was but eight years old when she thus presented herself for the first time to that public over which she has exercised a growing fascination ever since. I have watched her dramatic career almost from its very beginning, and I have long had the honor of her personal friendship. I think it is not too much to say that, in her own peculiar quality of acting, she has created a dramatic figure which will ever endure in the history of the stage. She seems to have thoroly understood from the earliest days of her career what the kind of part was which her genius and her temperament most distinctly qualified her to undertake. Her impulse was not to the thrilling and dazzling impersonations of passion, of suffering, of proud triumph and of despair which we associate with the careers of some of the great tragedy queens in all civilized countries. The genius and the temperament of Ellen Terry were, to my thinking, essentially sympathetic in the human sense, and she loved not so much to dazzle her audience from some mountain hight of dramatic emotion as to bring herself home to their hearts and into affinity with the feelings of their ordinary lives. I need not, however enter here into any study of Miss Terry's exquisite qualities as an actress, for her gifts and graces are as well known and as thoroly appreciated in the United States as they are in England, and many hundreds of American names are among the lists of those who joined in the celebration of her golden jubilee. I dwell upon the event partly because it gives me sincere pleasure to identify myself with such a demonstration in honor of a dear personal friend and partly because I feel pleased to show that we are not engaged here exclusively in the discussion of political questions.

Even already the account of President Roosevelt's speech at Washington, altho only just received in England, is keenly discussed in our newspapers and in our private conversation. President Roosevelt hardly ever opens his lips in public without giving the world some subject for earnest thought, and this time he has touched upon a question which is to all thoughtful minds becoming more and more serious. The vast increase in pri-

vate fortunes threatens grave social peril in Europe as well as in the United States and most of us have already got far enough on the way toward some legislative intervention as at least to ask ourselves "can nothing be done." President Roosevelt, at all events, believes that something can be done, and with characteristic courage and straightforwardness he suggests some remedial principles.

He is one of the few men now living whose every published word is instantly read and taken to account in all civilized countries. Already indeed some of our newspapers here are suggesting that President Roosevelt's recent words are an encouragement to Socialism, but I do not suppose that he will be much disturbed by that sort of criticism.

LONDON, ENGLAND.

## From Portsmouth to Algeciras

BY SALVATORE CORTESI

[Mr. Cortesi, who has been our valued Italian correspondent for some years, has just returned to Rome from Algeciras, and sends us the following interesting personal comparison of Algeciras and Portsmouth, at both of which conferences he took a distinguished part.—EDITOR.]

THE Algeciras Conference, which lasted almost three months, was much more interesting to those few of us who had already assisted at the Russo-Japanese Conference at Portsmouth, N. H., which lasted over four weeks, than for the world at large. It is difficult to say which of the two has been more important; for that held in America was to conclude peace between two worlds, the Muscovite and the Nipponic, while that held in Spain was to prevent a European war which might have assumed the vastest proportions. Indeed it may almost be said that Morocco and the different questions connected with that Empire were merely the pretext for the Conference, which had in reality a much graver task.

The delegates of Europe, America and Morocco did not really meet to discuss how to collect Mulai Ab-del-Aziz's taxes or to regulate his customs and patrol his coast, but to decide whether there should be a paramount Power in Europe and which Power it should be. Germany, which, after 1870, had always favored France's colonial expansion, as a species of distraction from her national policy of *revanche*, especially helping her to occupy Tunis in 1881, and assisting her in the Tonkin war, strongly resented the policy of M. Delcassé, and wished to prove that the Government of the Republic could not accomplish anything of

an international character without an understanding with Berlin. Moreover, Germany wished to sever the *entente cordiale* with London. In other words, the ancient hatred between France and Germany was coming to an issue, complicated by the racial and commercial antagonism between Germany and England.

Still it was not possible to have any statement of the kind from the able diplomatists gathered at Algeciras. The Duke of Almodovar, who with so much tact and courtesy stood as host to the Conference, the Marquis Visconti-Venosta, the doyen diplomatist of the world, who was Minister of Foreign Affairs forty years ago; Mr. Henry White, who, thru his long career, is the ablest representative of the United States abroad; M. Révoil, fresh from his fencing with Prince Radolin in Paris; Herr von Radowitz, assisted by Count Tattenbach, who accompanied the Kaiser in his famous visit to Tangier, and all the others, seemed bound to repeat the identical and insignificant statement regarding the love of all for peace, and the efforts which their Governments were making to maintain and strengthen it. When, however, they spoke confidentially and "not for publication" their music had quite a different tune. You would then have heard that France is now no more the country of April, 1905, when Ger-

many threatened her with impunity. Now France is ready, her artillery is superior to that of Germany, her cavalry is more numerous and better equipped, her war organization is the most perfect possible. Besides, she is not alone; for Russia, notwithstanding her troubled internal condition, is bound by the dual alliance to attack Germany if the latter provokes the Republic to war; and her understanding with England goes so far as to guarantee England's naval assistance, which would mean the immediate destruction of the German fleet and coast, including, perhaps, the landing of a British contingent on German soil, which, even if it failed, would have the effect of subtracting part of Germany's forces from the western frontier. Moreover, France has a secret treaty with Spain, which insures, if not the assistance of Spain's army, at least a sympathetic attitude; and finally the Mediterranean agreement with Italy, granting the latter a free hand in Tripoli, which places her as a member of the triple alliance in a most embarrassing position, as in case of a conflict either she would not maintain the pledges with the central empires or if she sent her army to the French frontier she would have to face revolution at home. To this view of the situation another was counterposed equally interesting: Germany does not fear France, either alone or with the might of all her old and new friends. Russia is not in a condition to attack Germany, because it would lead to the loss of Poland and the Baltic Provinces. Besides, England would certainly annihilate the German fleet if she could find it, which would not be the case, as, in a war with the British Empire, Germany would have her ships always protected by her forts, and the Russo-Japanese war has shown the difficulty even for an overpowering assailant to conquer, while the landing of troops is a dream. Berlin believes Italy will fulfil the engagements imposed upon her by the triple alliance, but if she did not, Austria will be only too glad to enter the Peninsula and reoccupy, after half a century, Milan and Venice. As to Germany herself, she can put in the field, not on paper, as in other countries, 4,000,000 soldiers, admirably trained, and provided with all which is necessary,

with whom she could confidently and advantageously face her enemies collectively.

It was understood that while the Conference was going on negotiations were proceeding among the Powers on the general situation, and that a success or a failure at Algeciras would indicate an agreement or a disagreement among them about much more vital points than the Morocco question. The system followed and the ways adopted were, on the whole, the same as those employed at Portsmouth. The German delegates were most resolute in stating that to no Power would be granted any privileges in Morocco, under any shape or form, while the internationalization of the police was their *sine qua non*. On their side the French representatives used all possible emphasis to convince the world that she would not yield a hair's breadth of her program, which consisted in having the control of the State bank and the organization of the police. It was the same tactics as was employed at Portsmouth when Baron Komura asked a war indemnity, the cession of Saghalin and the limitation of Russian naval power in the Far East, receiving from Count Witte the answer: "Not a kopeck or an inch of territory."

Another point of contact between Algeciras and Portsmouth was the housing of the Delegates. At Portsmouth they were secluded in the Wentworth Hotel, several miles from the town, and at Algeciras at the Hotel Reina Cristina, isolated from the village and facing the colossal rock of Gibraltar, oftencalled the *Los Dientes de la Vieja* (the Teeth of the Old Woman, alluding to England). It can scarcely be said which of the two positions is the most picturesque. The Reina Cristina stands on the promontory which divides the Gulf from the Straits of Gibraltar, commanding on one side the beautiful coast of Andalusia, and on the other the mountainous, rocky territory of Morocco, from Ceuta to Tangier. Whoever had been at Portsmouth missed at the Reina Cristina the bright, chatty and vaporous "summer girl" of the Wentworth, but in exchange there were plenty of Señoritas, with their mantillas, and the inevitable flower in the center of their luxuriant black hair, the

characteristic touch being given by the Morocco delegates, in their picturesque and striking costumes.

The first delegate, Mohammed El Torres, was especially interesting because of his patriarchal figure. He is descended from the Spanish Arabs who once occupied Southern Spain, and he still preserves the keys of the house inhabited by his ancestors at Cordova. When he appeared with his long, spotless, white beard, bowed over his stick with its ivory top, dignifiedly draped in his "caftan" (white wool mantle) he seemed a biblical apparition. One of the objects of the Conference seemed to be that of losing time, evidently to enable the Powers to carry on their negotiations, and the Moroccans seemed made especially to serve this purpose. Each delegation, now and then, before agreeing to a certain point, wished to ask instructions from their Government, which could not be denied to the delegates of the Sultan also, but each message of theirs, to reach Tangier and return, took nearly two weeks. Besides, now and then, El Torres, or the second delegate, El Mokri, rose in the middle of the sitting to deliver a speech in Arabic, which of course, no one understood, whereupon, the President, the Duke of Almodovar, proposed that as the representatives of his Sheriffan Majesty had spoken it was better to adjourn to have the speech translated. To this work were immediately set the interpreters, of whom almost every delegation had one, but as no two translations were the same, more time was lost in their coming to an agreement. For instance, one held tenaciously to his view that the expression, "European concert," in Arabic,

meant "European performance," and then when at last a medium draft had been evolved, and it was taken to the seat of the Conference in the Ayuntamiento, the Arab delegates promptly stated that, of course, their colleagues could make as many translations as they liked, but they would only recognize as official the original text.

The fall of the Rouvier Cabinet caused another delay of about two weeks, as M. Révoil was not authorized to make a single concession during the crisis, and the new Sarrien Ministry took some time before becoming thoroly acquainted with all which had been done and what they wished to do.

America was often spoken of during the Conference. Besides the delegation from the United States, the American press was well represented, and some of the delegates, who had been in Washington during their career, recalled, with satisfaction, the pleasant time spent there, especially M. de Margerie and Count Cassini, the Russian Ambassador, who, above all, preserves the kindest remembrances of everything connected with his sojourn in America. The conviction was unanimously expressed that America, thru her power and thru her growing interests in all parts of the world, is so unavoidably connected with international politics that she will soon need, as the other countries, a permanent body of trained and experienced diplomats. A prominent statesman remarked that the service rendered by America, at Algeciras, was invaluable, because she was the only country that had no direct interests which she wished to see triumph.

ROME, ITALY.

## The Spring Days of the Year

BY SUE E. HOWARD

THEY may come in the Autumn,  
These days so rich and rare,  
They may come in the Winter,  
When all is white and fair;  
In March with the first blue crocus.  
In Summer with harvest gold;  
When the year is just beginning  
Or when the year is old.

They come to us unexpected  
And life grows full and glad,  
Hope seems so near fulfillment,  
That nothing can makes us sad.  
Joy is in every atom;  
Perfect to us each thing.  
For 'tis not the time or season,  
'Tis the Soul that makes the Spring.

BURLINGTON, VT.

# The First Municipal Street Railway in America

BY ADELLA M. PARKER

[Our readers should be very much interested in the following article, which tells of the first experiment of municipal ownership and operation of a street car system by a city in the United States. The successful experiment of West Seattle has scarcely attracted any attention yet thruout the country, and we are therefore very glad to be the first magazine, as far as we know, to publish the facts.—EDITOR.]

WHILE cities East and West have been wrestling with the problem of municipal ownership a small municipality on the shores of Puget Sound has solved it. West Seattle owns and operates its street car line.

private subscription. West Seattle has scored a success.

It is not, however, chiefly because West Seattle has made a good investment that she is entitled to favorable comment. Nowhere is the fight for mu-

A Street in West Seattle.

Its cars have been running for more than a year; its fares are the lowest in the United States; its income is far in excess of operating expenses; its employees are better paid than those in the adjoining city; its road is being extended by

municipal ownership a fight to make street cars pay. Everywhere it is still a struggle for the mere privilege of trying the experiment, and this small city has earned the enviable distinction of being the first, and at present the only, city in

Elliott Bay, the Ferry Slip and the Trolley Approach.

the United States to gain this vantage ground.

This privilege of spending their own money in an enterprise for their own convenience was not won by the citizens of West Seattle without a struggle. Not only was a strong minority in the municipality hostile to the project, but the street car interests of Seattle—the Seattle Electric Company—opposed it at every step. Law suits had to be fought and injunctions set aside, but up to date pluck and persistence have won.

West Seattle is beautifully situated on a peninsula known as Duwamish Head at the entrance of Elliott Bay, the harbor of Seattle. The peninsula is a high bluff and the city is built on the plateau and can be reached only by climbing a long, steep hill. This suburb is reached from Seattle by means of a fifteen minute ferry ride across the harbor. In the "boom" times following the Seattle fire there was a cable car connecting with the ferry and running up the hill. During the panic following '93 the suburb

was almost deserted; the street car service was discontinued and ultimately the track was taken up and the power house was torn down.

With the influx of population after the Klondyke rush West Seattle began again to develop. Property values advanced, the ferry service was good, and the citizens were extremely anxious to have a street car line, as it was impossible for the suburb to improve rapidly without it. The Seattle Electric Company, which owns a blanket franchise on all Seattle lines, was urged to extend its service to this suburb. This could be done either by building a line across the tide flats or by building to connect with the ferry. The electric company promised to build a line.

Time passed, but the promise was not fulfilled. There were occasional rumors afloat that a line was about to be built, but the West Seattle resident continued to climb the hill.

Climbing a long, steep hill at the close of the day's work makes a man think,

and these suburbanites, after repeated delays, threatened to establish a municipal service unless something more substantial than rumors was speedily forthcoming.

To forestall a municipal service the Seattle Electric Company then put up a cash forfeit of \$2,000, promising to construct the road before January, 1903. When that time arrived the company secured an extension to July, 1903, but at the later date no effort had been made to fulfill the obligation.

Actuated partly by necessity, partly by revenge and partly by a real civic interest in the enterprise, the citizens now decided to declare the \$2,000 forfeited and to carry out their threat of municipal ownership if a sufficient vote could be obtained.

West Seattle was at this time a city of the fourth class, having a population of more than three hundred and less than fifteen hundred. The Populist Legislature of 1897 had enacted a statute authorizing cities of all classes to "purchase or construct and operate" "lighting

plants, water works and street railways." A vote of the council was necessary to submit the question to the people and a three-fifths vote was necessary to authorize bonds.

It was estimated that \$20,000 would build a mile of track, purchase two cars and install the electric power. Besides the \$2,000 forfeit there was \$1,600 in the road fund available for grading, so an election was called to vote \$18,000 bonds.

Meantime bitter opposition to municipal ownership developed in the community. It had its center in the West Seattle Land and Improvement Company, which owned the water system, and desired to secure a street railway franchise. The opposition was supported by a few wealthy residents and by all those whose sympathies were with corporate interests and who desired to forestall any such possible example of civic opportunity as a municipal street car system would afford. A hot campaign was fought and the bonds were carried by but a single vote.

The Cheerfullest Strap Hangers in America.

Meanwhile the fact developed that the \$2,000 cash forfeit was a \$2,000 check and that the Seattle Electric Company had stopped its payment. A suit to compel payment was carried to the State Supreme Court and won.

The first contractors who undertook the grading worked two days and abandoned the job. The company that finally performed the work wanted to stop short of the mile, but the full mile was constructed. Two cars were built in Portland, Ore., and the service was installed.

The ferry company, which is popularly supposed to be identified with the land company, now refused to give commutation tickets with the cars, insisting on a five cent fare. The city made the claim that the ferry slip was on a street and was therefore city property and again proved its claim in court. This brought the ferry company to terms and an arrangement was made to furnish for \$1 ten round trips on both the ferry and street car—half to go to the ferry and half to the city, making the fare on the street car  $2\frac{1}{2}$  cents—the lowest fare in the United States.

The first car carrying passengers over the line was run on Christmas Day, 1904. After a few days' run the service was interrupted for a short time to make needed alterations in the plant. Since February 1st, 1905, the service has been continuous.

For the first three months the enterprise lost money, and during the second three months it paid expenses, but during the third quarter it made \$667 above operating expenses. In the winter the travel is not so heavy, but the plant is now paying, even at the very low fare, while the rise of values and the convenience to the residents form a large credit balance.

The ferry runs once an hour. A car meets the ferry, and makes the run up and back before the ferry leaves. During the evening rush two cars are run for an hour and a half. Cars run regularly only in connection with the ferry, but a car will go up any time five fares are paid. The work is light. There are two crews, each with a nine hour run—6 a. m. to 3 p. m. and 3 p. m. to midnight. From 5.30 to 7 on alternate weeks the

crews work an hour and a half overtime. The men are paid \$60 per month and 25 cents an hour overtime.

Two engineers are employed at the power house and the town marshal is superintendent of streets and superintendent of street car service as well.

Last spring some real estate men offered the city \$20,000 to be used in extending the line three miles to a certain tract of land. This extension would have taken the line outside the city limits, so it became necessary to enlarge the city before undertaking it.

In Washington a city of the fourth class is limited in area to one square mile and cannot annex territory. West Seattle now claimed to be a city of the third class, with a population of 1,500. A city of the third class may annex territory, and an election for that purpose was held. Annexation was carried in West Seattle, but in the outlying territory was lost by a tie vote—4 to 4. As both sections must consent the question was lost.

A month later the council again proposed this question and another election was held. An injunction was now served on the City Council, ordering it not to hold the election, on the ground that West Seattle was not a city of the third class. The land company was behind this injunction, as it owned most of the land in the territory to be annexed, and did not wish to be subject to increased taxation for improvements.

When confronted by the injunction the city attorney took the ground that after an election had been called the Council was powerless to prevent its being held, and that while the election officers might be enjoined from acting it would still be the right and the duty of the people under the law to choose others and to proceed to cast their ballots. He held that while an injunction might be used to prevent carrying into effect the results of an election it was not possible by this means to prevent the people from casting their votes in a regularly called election. He advised the people to proceed with the election. They did so, and annexation carried in both sections by a much larger vote.

On the day following the election the city officers were cited before the Supe-

rior Court for contempt. The city attorney was fined \$100. All the councilmen, excepting two who opposed the election, were fined \$1 each. At the same time an action was brought to set aside the results of the election. The latter action is still pending in the State Supreme Court. An appeal from the contempt proceedings was also carried to that court, where the verdict was recently confirmed.

West Seattle had meantime rapidly increased its population. Cheap land so near the center of Seattle and a site unequalled in beauty needed only a convenient car service to attract many residents from Seattle. The school population increased 10 per cent. during the summer vacation. That its status as a city of the third class would soon be unquestioned was a foregone conclusion.

The opposition now shifted to new ground. Annexation to Seattle was proposed. Old party lines were abandoned, as was true in nearly all the Washington towns at the fall election. The "Taxpayers Annexationists" ticket opposed the "Citizens" ticket, and the "Annexa-

tionists" were defeated by a good majority.

The privilege of municipal experiment therefore still belongs to West Seattle, and as the city is attracting many young professional and business men who are interested in civic enterprise, further developments may be looked for. Last summer a private subscription of \$500 was raised to extend the street car to the schoolhouse—a distance of three blocks. At the last school election free text books were adopted on a distinctly unique plan. The school principal had proposed that the people buy the books this year at prices the school district could obtain—about three-quarters the retail price—and that these books then become the property of the school—the district renewing them in the future. The plan has been carried out. Bonds of \$9,000 have recently been authorized to build an electric lighting plant and the plant is now being installed. The ferry company has asked for a fifty year franchise of the valuable ferry slip, but there are those in West Seattle who think a ferryboat would be a good investment for the city itself to make.

SEATTLE, WASH.

# The Norwegian National Anthem

BY PASTOR FELIX

Upon the accession of King Haakon and Queen Maud to the throne of Norway, a public banquet was given in their honor, at which the National Anthem was sung. From a free translation given in the *London Times* the following rhyme is rendered:

We love our own Norse country,  
Her thousand homes we love;  
Furrowed and weather-beaten,  
Her front doth forward move;  
We love her—she's our mother,  
Who gave us noble birth!  
We love her songs and sagas,  
Her dreams that gild the earth.

The country saved by Harald,  
With his rankéd warriors;  
The land that Haakon guarded—  
Our love and praise be hers!  
Where Oivind once recited  
The runes of ancient time,  
The glory of her captains,  
Her men of deeds sublime.

We love our own Norse country—  
For her our fathers stood—  
The land where Olaf painted  
The hallowed cross with blood;  
Where from the hights spake Sverre  
Against enslaving Rome:  
We love our rugged country,  
We'll guard our Northern home.

EAST BOOTHBAY, MAINE.

# How the Earthquake Felt at San Jose

BY EDWIN GLENDINNING SHOUP

[The spot of greatest intensity of the California earthquake was at San Jose, and the following extract from the letter of one who went through the experience gives a graphic account of how it feels to be in an earthquake.—EDITOR.]

WHEN it came I was up and fully dressed, standing at the dresser. Suddenly there was a great, full sound, like the passing of wind thru trees, or, rather, like the sudden rush of a great volume of water. Then the ground rose right up, slowly at first; then it went down, and jerk, jerk, jerk, sideways and up and down, fast as tho some mighty giant was shaking the earth, after the manner of the school ma'am with the bad boy.

I had a lighted lamp standing on the dresser; the first shake brought the dresser on top of me and the lamp to the floor, spilling the oil, that flamed into a great ball of fire. Now, to keep your feet on a piston rod in action is as easy as to catch a flaming lamp rolling about on the floor and dodging under the bed; but I finally did catch it, and the next question was, how to get rid of it. I couldn't go to the door, as walking was impossible, and there was a screen in the window near me. I turned to it, intending to put my foot thru it, and saw it falling from its fastenings. I threw the lamp out and grasped the sill and watched.

For the space of two blocks, or as far as I could see, the ground was rolling and jumping like mad. A milkman's horse, hitched to a pole in front of the house, was down flat. Three times he tried to get up, and each time he was thrown again. Have you ever heard a horse scream in mortal terror? Well, that was what frightened me; before that I had been too busy to be scared, but that horse, and the sight of a great brick warehouse crumbling, frightened me terribly. In the meantime, I thought the house was going over, and all the while I thought the next jerk would be the last. It finally came to a finish, having lasted thirty-eight seconds.

Then came clearly the awful sound—the falling and crashing of the city. I suppose this was just the tail end of it, but it seemed as if it would never stop—crash on crash, followed by clouds of brick and plaster dust.

By this time I had run over to the car barns, which had partly collapsed. Some of the men were already there. We stood for a minute, too frightened to speak; then, without a word, started on a run for down town. Now and then we would come to a brick residence partly or wholly demolished, and the nearer we came to the large buildings the more complete the destruction. The streets were full of people in night clothes, some stupefied, and some busy putting out fires. By the time we were halfway to the business district (about half a mile) we could see three big fires, and heard the alarm sent in for the militia. When we got there the whole city looked as if what was left would surely burn, but, fortunately, none of the engine houses was wholly demolished, and, best of all, there was never any great shortage of water. Everybody fought fire, and with the exception of about two squares, and several scattered houses, we saved the town—or what was left of it.

Now, what seems miraculous is that only about thirty people in San José were killed, for, altho nearly every building in the business district, and any brick building without a steel frame, was badly damaged, still, in nearly every instance, just the outer walls fell away from the more elastic frame inside. For instance, nearly every outside bedroom, from the second floor up, is exposed.

San José has not only taken care of itself, but of a great many persons from San Francisco besides. San José is really just a residence town for wealthy San Francisco people. I have been up to San Francisco since the shake, and no one who has not actually seen it can realize it—the great, splendid, wealthy city a charred ruin!

San José got the worst shaking. We are in ruins because of nothing but the shake; San Francisco in far worse ruins because of the fire, altho the damage done by the shake was comparatively light, except as to the water mains. If there had only been a little water, San Francisco would be standing yet.

SAN JOSE, CAL.

# Literature

## Lady Baltimore

WE are too much attached to the word "great" in this country. It has become the mammoth tag of all our efforts to cover the whole situation with everything from a railroad system to a romance. Evidences of the latter fault are especially convincing. Too many of our authors have been laying the tails of their genius over our literary dashboard in their efforts to produce the "great" American novel. We have felt the strain of the performance without benefit. This is why we should be grateful now to Mr. Wister, who has come to the rescue by writing a good story of American life\* with the "great" left out—just as he has omitted the West—and so the result is not the shouting hallelujah of national glory which we have been trained to expect, but it is what we really need—a sound drubbing administered in good English, and in a polite, conversational tone.

The scene is laid in old King's Port—that is to say, Charleston, South Carolina—just as a contemplative man takes a quiet corner from which to observe what is going on about him. A young man from the North comes there ostensibly in search of a royal pedigree, but doubtless the author had in mind to retaliate upon the New Englanders who have made too much of their Pilgrim ancestry. What he really discovers, however, is that South which is watched over by its elderly Colonial dames, and which has

not yet been profaned by too much publicity.

The prejudices and pretensions of this section have been frequently caricatured in fiction, but it is doubtful if any other author has so accurately touched the keynote of the real South, or contrasted it so shrewdly with that of the North. So far her very advocates have been too loud-mouthed in their praise, too ill-bred in their own self consciousness to reveal her delicacy, her silence and her pathos

to the world. Above all, they have not been willing to confess this truth, which explains everything, from her lassitude to her pride: These people suffered, their men fought bravely, they saw their land desolate, their children beggared, and they died by the tens of thousands for what was *wrong!* They sinned one of the greatest sins in history, passed unrepentant, calling upon God with all the confidence of Christian heroes. Mankind has never witnessed a greater moral tragedy. And now,

being dead, the "Daughters of Dixie" cherish them the more dearly, the "Sons of Veterans" are the more jealous for their honor. Such organizations would be absurd in any other than a defeated country. It is the pathetic army which still stands with drawn swords above the graves of Southern heroes. Mr. Wister has interpreted the spirit of these 'memoried troops with compassion and understanding. And while dealing with the very characteristics which stand for the passions of the Southern people, he has made a decent

New Portrait of Owen Wister, Author of "Lady Baltimore," etc. Macmillan.

\* LADY BALTIMORE. By Owen Wister. New York: The Macmillan Co. \$1.50.

concealment of every one's emotional nakedness, a distinction lacking heretofore in Southern fiction.

The charm of the story as a story is indescribable. The author has a manner of standing hat in hand before the faded rose wreath of old ladies in King's Port which intimates at once the beauty and absurdity of their attitude to life. He makes a June ballad of their exclusiveness, he crowns their primness with the poetry of old fashioned words, and at- tends upon their shortcomings with irresistible gallantry. The hero is worthy of special attention, because the young man of the South has suffered more at the hands of the novelist than any other. He is usually represented as a bully or a cad in broadcloth or jeans, and always with a bad reputation. But the real young hero of this section is not to be described in the essayist's style. You may live with them and learn as Mr. Wister knows how to impersonate one, but you cannot flatten out his nature and disposition into a reading book lesson or use him to illustrate a tract on, say moral education. He has his morals, to be sure, but with him virtue must always be a "moral elegance," a politeness of the spirit. He cannot achieve it merely as a matter of conscience, but he must come at it as a grace of character. It is his final expression of manners, and he can hold to it even while his morals are, to say the least of it, unformed. These are distinctions which will seem absurd to those who have not the spirit, breeding or imagination to comprehend them. But they exist, and Mr. Wister has embedded them into one of the most admirable heroes to be found in this year's fiction.

And finally, the story is so constructed as to enable the author to pay his compliments to the "yellow rich" of the North in some phrases that are likely to stick to them longer than their dollars. As a class no other people in this country are so despised and reviled. Nothing but the innate brutality of their breeding enables them to be indifferent to such contempt. But Mr. Wister has made a satiric contribution to social science when he names them the "Replacers," locates them in the scale of things as having stocks and bonds for ancestors, and by their predilection for

the automobile. It is especially adapted to the disposition of the "yellow rich." The "Honk! honk!" of it is the natural voice of the Replacers as they ride ahead in the race. It expresses their cultivated rudeness, their constitutional vulgarity, in the terms of high priced speed. It is the imitation of that sporting instinct which makes aristocrats fond of mettlesome horses. And it is as offensive as all their other imitations.

### Palestine Exploration

The description of *The Jordan Valley and Petra*<sup>1</sup> by a Princeton professor and a well known American resident in Beirut, Syria, of a forty-one days' tour from the Lebanon to the desert south of the Dead Sea is pleasant in style, clear in description, and, without attempting to be more than popular, conveys much valuable information for all, from the Bible student to the mere sportsman, with genial humor sprinkled thruout the pages.

In connection with their visit to Jerash, the authors point out the important part which the Circassians may probably play when the Turkish Government begins to demand taxes from them. When at Jerash in 1904 as the guests of Abdel Hamid Bey, the head of the Circassian colony, we were told that they had been exempted from taxes for a term of years, the close of which was not then far distant, so that the trouble, if really coming, may be soon at hand, unless the Circassians are more willing taxpayers than the Arabs, which is not probable.

An interesting feature of the book is the discussion of the Madeba map, which is well reproduced, altho we regret that it is given in sections only, which makes it difficult for the general reader to reconstruct. The second volume deals for the most part with Petra, and, speaking from familiar knowledge and frequent visits to the scenes described, the descriptions seem to the reviewer to be accurate and the observations, on the whole, just, tho for the student breaking no fresh ground. The excellent and numerous photographs add much to the account of what may be seen in this city of wonders.

<sup>1</sup>THE JORDAN VALLEY AND PETRA. By William Libbey and Frederick Jones Hastings. New York: G. P. Putnam's Sons. 2 vols. \$6.00.

The authors' identification of Petra with Sela, mentioned in 2 Kings, 14:7, Is. 16:1, is scarcely tenable, for the parallel passage to 2 Kings, 2 Chron. 25:11, does not refer to a city called Sela, but simply to Sela-rock, and the reference in Is. 16:1 is more correctly referred to the rocky country of Edom.

After an account of the enchanted City of the Dead, covering about 250 pages, the writers deal somewhat briefly with the remainder of their interesting journey. They seem somewhat impressed by their own temerity in traveling, altho accompanied by soldiers and armed to the teeth. The reviewer has always found the protection of a penknife and a camera amply sufficient over the same ground, tho he and his party have been forced to submit to the company of a single soldier from Shobek to Petra!

The little list of travelers given in Appendix III. might have easily been increased by many well known names of visitors to Petra in the first and second half of last century and since 1900, as may be seen at a glance in Vol. I. of the sumptuous work by Brünow and von Domazewsky, "Die Provincia Arabia," 1904.

The book is profusely illustrated. Some of the photographs might even have been omitted as superfluous, especially some of the often repeated pictures of camps and of scenery little different from others already given. The type and paper are well chosen. We should perhaps read, on page 106, Vol. I., Sahem ej Jaulan, for *et* Jaulan in text and foot note.

The Eli Lectures, delivered before the Union Theological Seminary in 1903, are published under the title of *The Development of Palestine Exploration*.<sup>2</sup> Union is not apt to make a mistake in the choice of lecturers and we find that the author has carefully gathered together the main facts from all the important documents, ancient and modern, which bear, in any sense, upon the exploration of Palestine. The author devotes an entire chapter to Robinson, which, altho most interesting, might have been shortened, with advan-

tage, by the omission of the disproportionate biographical sketch. Dr. Bliss regrets that Renan, whose work he deservedly praises, did not make "the most of his unique opportunity for actual excavation" (p. 254), but the "*Mission de Phénicie*" will remain an enduring monument so long as Palestine has any interest for mankind.

The history of the origin and executive of the English Palestine Exploration Fund might have been omitted, as it does not add anything to the subject of the book, while, to the work of the German Palestine Society, which has been in existence for about thirty years, but twenty lines only are devoted. In the treatment of the early monuments we are surprised to find the famous Madeba map dismissed in a single sentence, while, *e. g.*, to the pilgrimage of Paula several pages are devoted.

The book is full of important information, not only for the Bible student, but also for the modern traveler, who incidentally receives some good advice.

Madame Loyson relates a journey<sup>3</sup> made eleven years ago, thru Algiers and Egypt, to Palestine, in the company of her husband, Père Hyacinthe, who was on a lecturing tour. She discovers many things, judging from internal evidence, mainly communicated by her dragoman, whom she sometimes confuses with a "fellah" (or agricultural laborer), and sometimes writes a "cavass," the liveried servant of a dignitary. She discovers that Arabs never "barter" (? bargain) about payment, that the children never ask for money, that the request for "backsheesh" is a compliment dictated by affection—doubtless the desire to possess a personal souvenir—that Arab ladies do not use mirrors (the harems are *lined* with them!), that the donkeys are beloved and treated as members of the family, that widows are not allowed to leave their houses, that there are no sects in Islam, that an Arab sheik carries a scepter about with him, which on one occasion he resigned, willingly, to Madame Loyson (probably to beat her donkey with), and, most remarkable of all, that the Bedu (who are depicted as

<sup>2</sup> THE DEVELOPMENT OF PALESTINE EXPLORATION. By Frederick Jones Bliss, Ph.D. New York: Charles Scribner's Sons. \$1.50.

<sup>3</sup> TO JERUSALEM THROUGH THE LANDS OF ISLAM. By Madame Hyacinthe Loyson. Chicago: Open Court Publishing Co. \$2.50.

living in a neatly furnished house dressed like the townspeople) are in the habit of wearing a turban of *lard*, a high, white flattened mass, weighing at least a pound. This pig's fat, which, contrary to preconceived notions (history, for example, relates that its use was the final cause of the Indian Mutiny), is very acceptable among Moslems, as it is very pure and white, and, again contrary to preconceived notions, does not melt in the sun. She discovers many remarkable Arab words, as *feleen*, plural of *fellah*, that *Medersa* (? Madrasee) means a Moslem university, etc., but this is pardonable, and the quality of her grammar and spelling may also be overlooked in an old lady who has lived long away from English-speaking people on the continent of Europe. Mme. Loyson is tolerant of everything except Christianity, other than that of Père Hyacinthe; of Germans, who, it seems, yoke their women with donkeys and drive them in carts, and have sabre cuts across their "university noses," and of tobacco, of which the first fruits are "disobedience of parents and law, lying, stealing, revolt, ruined health, blindness, ataxy, sterility, debauchery, infidelity, war, and murder."

A few pages, 278-325, are devoted to Jerusalem, the subject of the book, where the author's observations are quite as remarkable and original as those made in Egypt. It is, however, pleasant to find that she speaks with very just appreciation of the members of the "American Colony," who, tho they have the disadvantage of being very much Christians in life and work, nevertheless win the heart of Mme. Loyson by their relations with the Moslems, who hold them in a degree of respect perhaps unique in any country, and have confided to them their government school for girls and the education, in an admirable kindergarten, of great numbers of their own children.

## John Wesley and William Booth

IN the popular imagination John Wesley is the founder of the Methodist Church, and this is unquestionably the most important fact concerning him, despite his declaration made a year before his death: "I live and die a mem-

ber of the Church of England, and none who regard my judgment or advice will ever separate from it." But Wesley the man, the most indefatigable worker of the eighteenth century, the keenest observer of his time of the traits and tendencies of the English middle and lower classes, the courteous gentleman and accomplished scholar, the religious genius and the iron-willed master of men and of assemblies, is fully as interesting and profitable as a subject of investigation. The sectarian point of view has been prominent in the biographies of Wesley, of which there are nearly a dozen, but the most recent one,<sup>1</sup> by the Professor of English Literature in Wesleyan University, is a study of the man, rather than of the originator of a denomination, altho the religious leader does not suffer from being considered in relation to the great movements of his time nor from comparison with the great men who make eighteenth century history so fascinating and instructive. Professor Winchester's work is in every way to be commended. It is written in excellent style, and is marked by thoroughness of information, fairness of judgment, and that sanity and balance which come only with extensive knowledge. It should take its place at once as the best biography of Wesley for general use, and Wesley is certainly one of the men every one ought to know about, and the more one learns about him the greater becomes his admiration for his character and work.

Professor Winchester rightly makes much of Wesley's Journal, and it may be hoped that this biography will tend to make that most human and entertaining book more popular. The Journal is one of the best devotional manuals in existence, perhaps the best first hand authority on English social and religious conditions in the eighteenth century, and a marvelously frank and open revelation of one of the noblest, greatest souls that ever served its fellow men.

One is surprised at Professor Winchester's acceptance of Whitefield's figures as to the size of his audiences, 80,000 at Hyde Park Corner, etc. That the famous evangelist's numbers need

<sup>1</sup> THE LIFE OF JOHN WESLEY. By C. T. Winchester. New York: The Macmillan Co. \$1.50.

considerable discounting is shown by his mention of preaching to 6,000 in the Old South Church, a building which then had a capacity of 1,200!

No one would care to disparage the devoted founder of the Salvation Army, yet it must be said that the likeness between Wesley and General Booth, with which Mr. Coates begins his sketch of the latter,<sup>2</sup> is more superficial than real. Wesley's work was more with the middle classes and less with the proletariat than is often supposed, and he remained the Oxford gentleman and scholar to the day of his death. Mr. Coates's book is largely compilation, and one will turn to it in vain to find broad grasp of the relation of the Army to other religious and social efforts of the time, or even vivid portrayal of the personality of its subject. It fails also in arrangement of its material, has no index, and is not in any way satisfactory as a biography of General Booth.

**My Little Boy.** By Carl Ewald. New York: Charles Scribner's Sons. \$1.00.

Not often does the father of a little boy write his biography so humorously, tenderly and sympathetically as does Carl Ewald, in telling the story of his little son. The two are comrades, bound together by many common interests and pursuits. Nothing could be prettier than the conversations between the little boy and his larger playmate, confidant, and friend.

"Father," he says, "what is life?"

I give him a tap in his little stomach, roll him over on the carpet and conceal my emotion under a mighty romp. Then, when we sit breathless and tired, I answer, gravely:

"Life is delightful, my little boy. Don't you be afraid of it!"

The little boy, who, as his father ingenuously tells us, "is not a pretty child, but is charming," teaches his father a few lessons, altho the wise man needs fewer than most parents; and the little lad learns many lessons, as all boys and girls must, only most of them are not so fortunate as he in their instructors. "Our little boy must learn to know the power of money and the joy of money. He must earn much and spend much," yet he

must be taught strict honesty, and respect for the rights of others. The father teaches these things as well as many others, truthfulness, fidelity to a trust or to a promise, the cruelty of race prejudice, in a way of his own, which is always sympathetic and respectful of a child's feelings.

"And we go to a place we know of, far away behind the hedge, where we lie on our backs and look up at the blue sky and talk together sensibly, as two gentlemen should."

It is the sweetest biography we remember. And it ends when the father with a pang more often felt by the mother, or, at least, if that is not fair, more often expressed by her, "hands him over to society," in other words, sends the little boy to school.

"Where they will tell you that two and two are four!"

"Mother has taught me that already," says he, blithely.

If a man can read the book without a tender smile hovering about his lips and eyes that sometimes dim a little, we would not care for his acquaintance; or else, he is one of those unfortunate people who have never had, in fancy or in fact, the blessing of a little boy of their own.

**The Country Town.** A Study of Rural Evolution. By Wilbert L. Anderson. New York: The Baker & Taylor Co. \$1.00.

This book is a serious study of the present day social problem presented by the condition of the country communities in their relation to the alleged degeneration of their inhabitants. It deals with the decay of the industries of the soil, and the migration of the best young blood to the large cities. In order to be of real benefit this book should have been cast in such form that it could be easily read and comprehended by the better class of country people, whom it particularly concerns. It is involved in style; is loaded with quotations and citations having no particular bearing on the case, full of repetition, and not clear in its manner of reaching conclusions, which are, however, sane ones. The author looks for the salvation of the country town to the more liberal education of the youth of the present day, and to the changes made in rural life by the trolley and telephone and improved farm ma-

<sup>2</sup> THE PROPHET OF THE POOR. The Life Story of General Booth. By Thomas F. G. Coates. New York: E. P. Dutton & Co. \$1.50.

chines. His hope for the country lies in the great middle classes. Much has been said and truly of the removal of the upper stratum of the country population to the cities. Mr. Anderson sets forth in contrast to this fact the statement that the lowest stratum of society is likewise driven from country to city, thus leaving the middle class, which is the hope of society, in greater force in the country. Improvement of conditions of living in the rural town will surely elevate those already affected by its environment, as well as attract a better class of people to agricultural pursuits. Mr. Anderson concludes his book with this solution for the problems which he presents: "In every community the issue depends upon generous deeds, tireless diligence and steadfast patience."

**Sir Walter Scott.** By Andrew Lang. *Literary Lives.* New York: Chas. Scribner's Sons. \$1.00.

Mr. Lang's volume is not in any sense a contribution to the literature of Scott. Nor is it even a plain, straight-away narrative of his life. It is altogether too conscious of the authorities that have preceded it to be a satisfactory substitute, as it pretends, to a reader who knows nothing about them. But it contains some rather good bits of appreciation—in those parts particularly where Mr. Lang is concerned to reassert Scott against the superciliousness of our later day criticism and to rescue him from the invidiousness of a comparison with our literature of ignorance and presumption, as he calls it. This is lively and amusing, and not wholly unjust perhaps; but at all events it serves to animate a book which does not otherwise make very good reading.

**From the Book of Valentines.** By Bliss Carman. Boston: L. C. Page & Co. \$1.

Mr. Carman's sincere admirers will be glad of his return to Parnassus after his late excursions into prose. The *Book of Valentines* is another of those volumes of light handed verse which he does so well that it is pity he should ever leave them for the essay. It is marked by his usual qualities of cheerful seriousness and quick and delicate sentiment. Of all the pieces perhaps the best is the

"Players," an excellent variation of the familiar comparison of the world to a stage.

"Before our eyes as we come on,  
From age to age,  
Flare up the footlights of the dawn  
On this round stage."

**Carthage of the Phoenicians in the Light of Modern Excavations.** By Mabel Moore. With numerous illustrations. 16mo.; pp. vi, 184. New York: E. P. Dutton & Co. \$1.50.

The author has had the advantage of a personal visit to the site of ancient Carthage, and of full conference with Father Delattre, who has had charge of the excavations under the support of the White Fathers of Cardinal Lavigerie. Her book is less a study of the Carthaginians than it is an account of the diggings and their result. Carthage is not particularly rich in relics. There are sarcophagi, some of a much superior art to that which we call the Phœnician from Cyprus; and the bronze razors are handsomely engraved and are the best that have been found. The Punic inscriptions are not particularly interesting, except to the decipherer. As an account of the diggings in three principal necropolises, the book is of real value to a student of archeology, altho it contains no great treasures. When the author wanders from her immediate subject into parallel fields, apart from the instruction of Father Delattre, she is likely to fall into error. Thus we are surprised to find three times on p. 19 "Ishtah" for *Ishtar*, and similarly "Athtah" for *Athtar*; on p. 20 "Tainat" for *Tiamat*; on p. 54 "Melgart" for *Melqart*; and on p. 24 the extraordinary statement that the "ubiquitous name of John" comes from the source of Ea-Han, or Oannes.

**The Inward Light.** By Amory H. Bradford. New York: Thomas Y. Crowell & Co. \$1.20.

Dr. Bradford is a teacher of spiritual religion. A warm hearted and devoted man, alertly sympathetic with every forward and benevolent movement, appreciative by natural instinct of the needs and temper of the times, he cast off long ago slavish appeal to the letter of book and symbol, and gave himself to the

study of truth which a man can utter with no other authority than that of the truth itself. He has not had the time, and perhaps not the inclination, for original research, but he has the faculty of almost unerring appropriation of the best work of the best students and writers in widely separated fields of knowledge, and his literary skill enables him to present some of the best thought of the day in very attractive form. His present work is a series of essays, from different points of approach, of the light that lighteth every man, and the chapters on "The Inward Light," "The Inward Sinai," "The Continuous Leadership of the Holy Spirit," show Dr. Bradford at his best as a teacher of spiritual religion. Altho these papers were written before the publication of Sabatier's "Religions of Authority and the Religion of the Spirit," they may be regarded as the doctrine and message of that remarkable book adapted to the religious situation in America.

**The Abolitionists.** Together with Personal Memories of the Struggle for Human Rights, 1830-1864. By John F. Hume. New York: G. P. Putnam's Sons. \$1.25.

This book is, in a sense, a reply to some sweeping generalizations about Abolitionists made by Theodore Roosevelt in one of his early biographical works. The author comes from an Abolitionist family of Southwestern Ohio, and was himself active in the anti-slavery crusade. During the war he was the editor of the radical *Missouri Democrat*, and he attended as a delegate the convention which renominated Lincoln for the Presidency. It is a deeply interesting series of sketches which he presents. His purpose is to justify the Abolitionists in their policy, and to depict them as he saw and knew them, to a later generation. One may sympathize with his fervent defense of them without agreeing with all his claims in their behalf. It is evident that he pays too little attention to the great social forces that made the war inevitable, and attributes overmuch to the personal efforts of his heroes. Nevertheless, he has given us a great deal of valuable information, both political and personal, and has furnished some new lights in which to judge the men and

events of that stormy time. His view of Lincoln is somewhat critical, but, on the whole, we should say, just; and his account of the political squabbles in Missouri, and of Lincoln's attitude toward the various factions, is extremely interesting. It is unfortunate that dates and exact particulars are often missing and are sometimes wrongly given. The date, for instance, of Elijah Lovejoy's coming to St. Louis is put two years subsequent to his murder at Alton, Ill. But, for all defects, it is a collection of reminiscences well worth reading.

**Pam Decides.** By Bettina von Hutten. New York: Dodd, Mead & Co. \$1.50.

In this sequel to "Pam," we find her twenty-seven years old, on the third floor of a Bloomsbury boarding house, and the author of twenty-two novels, written since we saw her last. Caliban, the familiar spirit of the earlier book, is dead, and not regretted by the present reviewer. We grew weary of the monkey "to whose eyes those of his mistress bore a startling resemblance." Pam, however, is one of those loving souls who must have a pet, and she finds one suited to her need in a dapper young diplomat, whose smallness, and daintiness, and exquisiteness of attire are much insisted upon, in contrast to the dingy people about her.

"He was such a dear. Even his perfect clothes and the small seal ring on his little finger added to her complete satisfaction in him."

He is at first a friend, then a lover, and his name is Lensky. James Peele, M. P., Charnley Burke, and the incomparable "Ratty," love her also, and all of them figure in Pam's story, making or marring her happiness in unexpected ways. The title of the novel, *Pam Decides*, indicates that the readers of "Pam" will be relieved from the strain that has been on their minds for over a year, for the most experienced novel reader could not anticipate the decision of this most capricious of women. We have seldom had a heroine on our hands, an attractive heroine, eligible in every way, who gave us so much trouble to marry off, and we were so relieved to have the matter settled in the last few pages of this volume that we do not care to question whether

her choice was the wisest she might have made.

**The Long Arm.** By Samuel M. Gardenhire. New York: Harper & Brothers. \$1.50.

Le Droit Connors is an American Sherlock Holmes, with the addition of Indian blood in his veins, cleverly mixed with Anglo-Saxon and Irish. This combination gives him some advantages over the ordinary or even extraordinary detective. He can recognize a footprint in the yielding surface of a velvet rug or on the grass of a lawn, knowing them to be identical, and he can cauterize his arm with stoicism if his need require such an effect upon a woman's nerves. His adventures are many, and the mysterious crimes he undertakes to unravel are worthy of his unusual powers. *The Long Arm* of his intuitive insight into character, more perhaps than into clews of circumstance, reaches out and grasps some very clever criminals.

**A Maker of History.** By E. Phillips Oppenheim. Boston: Little, Brown & Co. \$1.50.

Mr. Oppenheim might have called his book the "Odyssey of a Sheet of Paper," as it is the wandering of a written page at the will of the wind, which brings a young Englishman, his beautiful sister, the Hero, the "Friend of the Hero" and several other people into serious and even dangerous difficulties, and gives a romantic explanation of the reason why there was no war when the Russian fleet fired on the British fishermen. The secret service police of three countries exert all their cleverness in thwarting the efforts of an English nobleman and his friend, a seasoned newspaper correspondent, to find a brother and sister who have both vanished out of Paris as completely and mysteriously as tho they had stumbled upon the key to the fourth dimension. Mr. Oppenheim handles his material cleverly and makes of it a good story of adventure. If the love theme had been left out, it would rank with the few fascinating romances which boys adore "because there is no foolishness in them." DeFoe wrote one, Stevenson more than one such story. We believe Mr. Oppenheim could do it, and gain an immortality as a narrator of perilous ad-

venture rather than in the worn path of sentimental heart interest. Love stories are well, and there is no danger of a dearth of them, but their place is later in life, after the wander-years are over and the desire for adventure and moving accidents by flood and field has been satiated. The women had better be safely out of the way—say, between the covers of a gentler novel by Alice Brown or Mary Wilkins Freeman, who delight in purely feminine society—while the fighting is going on, and the days of hardship and dangerous exploits endured. That women may have perils and adventures of their own is very likely, but that should be another story.

**Poultry Farming.** Some Facts and Some Conclusions. By "Home Counties." New York: E. P. Dutton & Co. \$1.50.

A careful reading of this book should prove a sure specific for that most dangerous malady, Chicken Farm Fever. Tho written by an Englishman, it would be equally efficacious for the afflicted ones in this country. It proves, at least to the satisfaction of the author, that, while a limited number of barnyard fowls on a farm may show a good balance of profit in their favor, the increasing of the flock to the dimensions of a business in itself adds to the expense in a much greater ratio than to the profits. If one hen earns a dollar a year for her owner why will 5,000 hens probably lose their owner \$1,000 in the same time? The fatal law of diminishing returns comes in here. The few fowls can be kept on a farm, or small place, with almost no appreciable expense of food or housing or marketing. The average man establishing a chicken farm is too much attracted by the venders of patent poultry supplies and foods, and by the allurements of fancy breeds. The dangers of disease increase immensely as the flock grows. Our author does not say that a paying chicken farm is impossible; he only cites many cases which go to show its extreme improbability. He pretends to have weighed all the chicken farms of England in the balance and never to have found one whose accounts showed a fair profit for any consecutive number of years. This in relation to regulation chicken farms. He finds much profit to

the farmers from their small flocks of birds and also good profits in a system much practiced in England, of poultry fattening. The birds are bought from the farmers when nearly grown, and fattened for market by experienced feeders. We feel not the least hesitancy in recommending this pessimistic book to our chicken loving friends. It is good reading and our faith in the hen that lays the golden egg is undaunted, whatever may be the logic of her detractors.

### Literary Notes

IN our issue of May 3rd, the familiar name of Nathan Haskell Dole, author of "The Building of the Organ," was accidentally printed "Pole."

....We recently called the attention of our readers to *Everyman's Library* as affording an opportunity to get standard books in a handy and attractive form at a low price. In the advertising pages of this issue is given the list of the volumes so far printed in this series.

....Some interesting reminiscences, tho too largely of a personal nature, of Hawaii in the early days are given by Dr. Henry M. Lyman in his new book, *Hawaiian Yesterdays* (McClurg, Chicago, \$2.00). The author was born in Hilo in 1835 and describes missionary, native and naval life in a pleasant way with abundant detail. The volume is well illustrated with old prints and recent photographs.

....William Edgar Fisher, of Wellsville, N. Y., will presently issue a fourth collection of signed and numbered artists' proofs of a dozen of the more recent book plates designed by him. These proofs will be printed on Japan vellum, 7x10 inches in size, and will be uniform with those previously published. Five of the plates will be hand colored by Mr. Fisher, and there will be included a number of copper intaglio engravings. The edition will be limited to 100 copies and will contain none of the designs included in the previously published collections. The price of this fourth collection has been fixed at \$250.

....The American Copyright League, organized more than twenty years ago, is now active in the matter of securing a general revision of the copyright laws of the United States. The movement to revise the copyright laws was begun on the initiative of the Librarian of Congress and is now in progress. Several conferences have been held during the past year and the League has steadfastly advocated the safeguarding of the author against loss of copyright thru the error or omission of any administrative officer or thru any failure to observe the prescribed formalities which is not due to his own negligence; and the establishment of an alternative term of copyright, namely, forty-two years, or the author's life and twenty-one years in addition, whichever period may prove the longer.

....The addresses given at the Third International Council of Unitarians and Other Liberal Religious Thinkers and Workers, held in Geneva last August, have just been published in a volume sold by the American Unitarian Association, 25 Beacon street, Boston, for 75 cents, in paper. Reports of liberal religious movements in Germany, England, France, Italy, United States, Holland, Belgium, Hungary and India are included. Among the most noticeable papers are "*Le Monotheisme et ses formes*," by Père Hyacinthe Loyson; "*La Separation des Eglises et de l'Etat en France*," by Prof. Réville; "*Montre-Nous le Père*," by Charles Wagner, and "Religion; Its Changing Forms and Its Eternal Essence," by Rev. Minot J. Savage. The next Congress will be held in Boston in May, 1907.

### Pebbles

"MY dog took first prize at the cat show."  
"How was that?" "He took the cat."—*Judge*.

HOW THEY SING IT IN BOSTON.

EVERY one labors except our distinguished progenitor.

He reposes in a recumbent position within our residence thru the day,

His pedal extremities idling upon the bronze of the steam radiator,

Serenely engaged in extracting nebulous atmosphere from a tobacco receptacle of mundane matter.

Our maternal mentor receives soiled linen for the purpose of cleansing it,

And in this connection I should include filial Ann.

Indeed, everybody is engaged in some variety of occupation in our domestic habitat—

Excluding, as primarily suggested, our distinguished progenitor.

—*Springfield Republican*.

AFTER a few weeks at boarding school Alice wrote home as follows:

"DEAR FATHER: Tho I was homesick at first, now that I am getting acquainted I like the school very much. Last evening Grayce and Kathryn (my roommates) and I had a nice little chafing dish party, and we invited three other girls, Mayme and Carrye Miller and Edyth Kent. I hope you are all well at home. I can't write any more now, for I have a lot of studying to do. With lots of love to all, your affectionate daughter, ALYSS."

To which she received the following reply from her respected father:

"MY DEAR DAUGHTER ALYSS: I was glad to receive your letter and to know that you are enjoying yourself. Uncle Jaymes came the other day, bringing Charls and Albyrt with him. Your brother Henrie was delighted, for he has been lonely without you. I have bought a new gray horse whose name is Bylye. He matches nicely with old Fredde. With much love from us all, I am your affectionate father, WYLLYAM JONES."

The next letter was duly signed "Alice."—*Woman's Home Companion*.

# Editorials

## The Railway Rate Bill

INTEREST in a personal controversy as to the accuracy of Mr. William E. Chandler's report of the President's remarks about three Senators should not divert public attention from what the Senate has done and is about to do. It has quite notably strengthened the Railroad Rate bill which it received from the House, and it will soon pass the bill with the improvements which have been added. These additions are decidedly of a radical rather than of a conservative character, in the meaning which has been given to these words when they have been used to define the attitude of Senators toward the bill. If the amendment relating to judicial review be temporarily laid aside—and we shall speak of that later—all the other amendments are clearly the work of the radicals, and the radicals appear to have become an overwhelming majority of the Senate. By the evidence of recent investigations and indictments the so-called conservatives have been converted or silenced.

These amendments restore the old penalties of imprisonment for those who give rebates, impose extraordinary fines upon shippers by whom rebates are accepted, in the interest of prosecutors prolong the period of the statute of limitations, forbid the granting of passes, make the owners of pipe lines common carriers and subject them to the authority of the Commission, place also under the supervision of the Commission the express companies and the sleeping-car corporations, and seek to confine the railways exclusively to the business of transportation by forbidding them to carry from one State to another commodities which they manufacture, mine, produce or own, or in which they have a direct or indirect interest.

It should be observed that all these provisions have been added to the House bill substantially without opposition manifested by votes, altho a little was shown in argument. Here we see the wholesome effect of publicity, for the attitude of a considerable number of Senators has undoubtedly been affected

by the results of recent official inquiries concerning the coal interests of railways, and the unlawful conspiracies of the railways with the Standard Oil and Sugar Trusts, as well as by the public discussion which the evidence procured by these inquiries has caused.

For many weeks before these amendments were taken up for action, the chief subject of the memorable debate was a question of which the average citizen could know little or nothing—the question whether the courts should be restricted in their review of the Commission's rate orders. Those were enjoyable days for the experts in constitutional law, whose usefulness in our national legislature we would by no means underestimate.

For various reasons, the decisions of the Commission in the past had frequently been made ineffective by delays in the courts. It was natural that the advocates of legislation enlarging the Commission's power should desire to prevent such delays and to provide for a prompt and effective use of the greater power which was to be granted. Hence their desire and attempt to restrict the scope of the courts' action. At the same time, some who opposed any grant of rate making power sought, in the interest of the railways, to preserve those methods or conditions which had caused delay and thwarted the purposes of the Commission. Over this question, whether the scope of judicial review in rate cases should be broad or narrow, the contending factions fought for a long time.

It has seemed to us that a broad or unrestricted judicial review of rate orders was not to be feared by advocates of rate regulation, if due provision were made for expediting decisions and for full justice to both shipper and carrier pending the final settlement of each controversy. Our courts deserve the confidence of the people. Many of them have much more work than they can fairly be required to do. Thru no fault of their own, the administration of justice is sometimes delayed. One remedy is more courts and more judges. To limit the

power of the courts with respect to complaints concerning freight rate orders seems to indicate distrust of the tribunals. The world has no courts which better deserve to be trusted than our own.

Mr. Roosevelt and a certain number of Republican Senators desired that the scope of the court's review should be in some measure restricted, in order that the Commission's orders should surely and promptly be effective. It appears that for some time the President thought a majority in support of his view—and a majority against attempts to make the bill one of no real value—could be obtained only by a combination of the Democrats with a minority of the Republicans. But Mr. Tillman's own figures show that at the time when the Allison amendment was approved by the President, a trustworthy majority of this hybrid character had not been surely procured.

Mr. Roosevelt naturally preferred that the bill should be passed by Republican votes, if enough of them could be found, and that thus it should be credited to the Republican party. He also desired to prevent such a division of that party as might be caused by an attempt—possibly successful, possibly futile—to pass the bill by a combination in which there should be more Democrats than Republicans. The Allison amendment was produced and submitted to him. He turned from his original project and grasped this opportunity. Whether or not in turning he observed all the rules of courtesy in his treatment of the Democratic Senators is a question to be settled only after all the evidence is in.

Was acceptance of the Allison amendment a surrender? Was it an abandonment of the contention for limited review, and a submission to senatorial representatives of railway interests? Let the vote on this amendment answer these questions. The main part of the proposition was adopted without a division; the accompanying provisos by a vote of 73 to 3!

No one cared to be recorded as voting against the part relating to the action of the courts. Not even Mr. Bailey, who had asserted that it opened the door for the "broadest possible review." Nor

Mr. Rayner, who had called it a trap in which Mr. Roosevelt had been caught, and who had congratulated the railroad presidents upon the victory they had won in the acceptance of it at the White House. And all who could be found to vote against the remaining part were Messrs. Morgan, Clarke and Pettus, who had scarcely been heard in the debate.

We do not undertake to say how much of a review the amendment permits. This may not be determined until a case under the new law comes into court. But we do point out once more that when the amendment was brought to a vote no one of those who had bitterly denounced it as a "cowardly subterfuge," a surrender to the railways, and an acceptance of that unlimited review which they had strenuously opposed, asked that his vote be recorded in the negative.

### The Birth of a Free Nation

PAUL had a way of addressing his converts as "saints," but when he wished to be more exact he said they were "called to be saints," which is not quite the same thing. It is by a similar prolepsis that we can speak of Russia and its people as now free. We believe that freedom is assured, that the sun is arising, that his chin is on the orient wave, that nothing can hold him back from his zenith, but there are yet giant clouds that he must fight and conquer before he can rejoice to run his mighty race.

The Duma is actually in session and council. Its authority is limited, but yet its power will reach beyond its credentials. It represents the people, and when it speaks Czar Nicholas II cannot but know what the people want, and he will be a daring ruler who will not grant the demand. Now the nation has a voice, clear, insistent, ominous. That will be enough, whatever the bureaucrats may say or do.

The Russian constitution is in the making after the pattern of the British constitution. It is no changeless document to be fought over by Senators and interpreted by a court of judges, but will develop itself, which is just as well. There are two Houses, whether we call them consultative or legislative. The

superior one is, or will be, as in Great Britain, the inferior one. The House of Lords has to bow to the House of Commons, after some delay; but it must yield or perish when the people speak. So the Upper House in Russia. The Council of the Empire consists almost wholly of men selected and appointed by the Czar. They represent the old ruling class. It is their business to pull in the breeching. The lower House is purely representative, its members all elected, altho some of them thru several stages of election, as we elect our Senators and President. Not now, perhaps, but in the end the power will be with them; and they have begun their work with cool wisdom, for nowadays people of intelligence have learnt, even Russians, how parliaments must do their work.

It is true that an attempt was made to restrict the powers of the Duma, and to control the will of the people by the device of the Council of the Empire. But that is not a serious wrong. It was in 1253 that the first representative Parliament assembled in England. It has not yet abolished the hereditary Upper House or the hereditary head of the nation.

The peaceable way in which the Duma opens its work, after the serious riots of a few months ago, is full of hope. Altho our forefathers had witnessed the operation of parliamentary government for several centuries, we were unable to arrive peaceably at the present operation of this principle in our own affairs. The people of America had to force the hereditary ruler of England to let us have representation in the Parliament which passed on our affairs; and then we had to go thru an awful civil war before we learnt how to make proper use of this right of representation.

With these facts in mind we will be better prepared to grasp the significance of what has just taken place in Russia.

The Emperor was in possession of more extreme powers than George III. had under the English Constitution. He was surrounded by a determined company of what may be termed the "ruling class." A fixed conviction of this class is that the people are incapable of governing either the nation or themselves individually; and those particular repre-

sentatives of this class, who surrounded the Emperor, had a very severe case of this hereditary disease.

Nevertheless, the Emperor decided to consent, without civil war, to the creation of a Russian House of Representatives, and on the day appointed for its first assembly, he appeared in person to meet the representatives of the people, and spoke a few simple words full of meaning to those who have the mind to comprehend them, in the light of our own progress toward sound parliamentary government. His address was hopeful and wise. He laid down no hampering restrictions. He said:

"May God bless the work that lies before me in unity with the Council of the Empire and the Imperial Duma! May this day be the day of the moral revival of Russia, and the day for the renewal of its highest forces!"

That is pacificatory and hopeful.

It is plain, after reading this historic address, that the Emperor of Russia has taken his stand on the side of progress. Henceforth he is committed to the policy of co-operating with the forces that have proved irresistible in all America and in practically all of Europe. Having called into being a Russian House of Representatives, he pledges himself to its preservation. And the most casual survey of history will persuade any one that this body will proceed continuously along the road which will enlarge its powers. Even the efforts that will be made to destroy it will only increase its force.

## Will Education Do It?

THE Hon. Andrew D. White, ex-university president, ex-Ambassador, author of "The Conflict of Science with Theology in Christendom," in an interesting address on "Education and Democracy," delivered to the faculty and students of Cornell University the other day, made the prediction that America may yet be saved from the fate that has overtaken nearly all republics hitherto. The means of salvation he discovers in a better education of the people.

For more than a hundred years we have been trying two very interesting experiments. We have entrusted the work of creating and developing a great federal nation to the common people, and

we have been developing a great system of popular education to help the common people to know what they are about.

Most Americans believe that both of these experiments have been reasonably successful. They suppose that we have demonstrated the practicality of democratic politics working thru republican institutions. They take it for granted that our common schools prepare the young American to play his part wisely as a voting and office holding citizen.

Yet here comes Dr. White with an intimation that the republic stands in need of salvation, and that, in order to save it, we must make some change for the better in our popular education.

We are sincerely glad that Dr. White has seen that republican institutions in these United States are in danger. THE INDEPENDENT made this discovery a good while ago, and it has been trying to awaken the American people to a realization of their situation and of their duty. We are glad to welcome all recruits to the good company of those who still believe that republican institutions are a priceless possession, and at the same time have sense enough to understand the full meaning of the good old axiom, that eternal vigilance is the price of liberty.

The power that threatens republican institutions in the United States is Mammon. A good book told us long ago that the love of money is the root of all evil. The history of the American people has been a remarkable verification of this generalization. The love of money prevailed in the Constitutional Convention against those far seeing statesmen, like Jefferson, who wanted to prohibit slavery. The love of money impelled our Southern citizens to try to extend the area of slave labor, and it thereby precipitated the Civil War. The love of money led the Northern manufacturers to enlarge a policy of protection that was intended only to shield infant industries temporarily from a destructive foreign competition into a system of privilege, log rolling and greed, which has debauched our politics and undermined our national morality. The love of money has tempted the organizers of corporate industry to obtain by bribery many unjust privileges and to shield themselves

from a just control by the courts, while they have built up vast monopolies that thrive by extortion. The love of money has created in this country a money power, which seeks to substitute the rule of a plutocratic oligarchy for the republican form of government that our forefathers established.

Yet all this while the common schools have been educating the people. They have taught American children the Declaration of Independence, the history of the struggle for liberty, and that of the war for the preservation of the Union. It is not because American youth have not been indoctrinated with ideals of liberty and good citizenship that they have grown up to be givers of bribes and sellers of votes. Their loyalty to high ideals has been impaired by the subtle influence of that materialism which pervades our American life. They have been caught in the struggle for dollars, and have forgotten the things that are worth more than money.

So, when Dr. White expects that a better education will save the republic, we find ourselves asking him what kind of education he means. It must be one, he says, that will lift the people above buffoonery, party cries, wiles and chicanery. Above all, it must "develop in the majority of the people sobriety of judgment which will be above all bribes, trickery and hysterics."

This is excellent as far as it goes. So, too, is Dr. White's further insistence upon something which he calls religious instruction in the public schools. For by this term he does not mean any denominational teaching. He means that inspiration and uplifting which is imparted by the noblest writings of the sacred books. All great and worthy minds in all generations have paid their tribute to this influence, and Dr. White is entirely right in assuming that no people can fulfil a high destiny which does not pay regard to this element in the education of its youth.

Yet when we have acknowledged the reasonableness and the excellence of all these suggestions, we have but exposed the inadequacy of Dr. White's prescription. Because in none of these things has our American education failed. The public school has been supplemented by

a training in the home, in the church and in the Sunday school, which a vast majority of Americans have enjoyed. Dr. White, in telling us what American education must be in order to save the republic, is but describing what American education on the whole has been. Why, then, is the republic in danger? Why, then, must the republic be saved?

We will tell Dr. White. Something besides education is necessary. We must re-establish that approximate economic equality which, all human experience has shown, is quite as necessary as political equality, and equality before the law, and quite as necessary as education for the maintenance of a republic. We must abolish those privileges—unjust, immoral, un-American—which have created our arrogant, un-American, plutocratic oligarchs. So long as we maintain these privileges we shall create men whose god is money. So long as we create Mammon worshippers we shall have a nation of bribe givers, gift takers, tricksters, vote sellers, gullibles and buffoons.

When besides education we have the square deal the danger that threatens the republic will be safely passed.

### Earthquake Cures

NATURE, even in her most grievous moods, always has unexpected compensations. Very probably one of the most interesting features in the recent reports from the scene of the earthquake has been the announcement of the cure of a number of a people who were suffering from supposedly incurable ailments. The shock of the earthquake itself and the subsequent terror from fire has proved sufficient to arouse dormant energies and people have been able to walk and to talk who have been afflicted with incapacity in either or both of these senses for many years. In one case that has been reported in some detail, the paralytic had been absolutely bedridden for over fifteen years, yet has been able to walk perfectly since the earthquake and to take part in helping others, so that he is quite rejoiced over the change in life that the otherwise sad misfortune has brought to him.

Some time ago it was announced that

one curiously interesting result of the earthquake and the subsequent hardships was the celebration of a number of marriages that otherwise were not to have taken place for a considerable period. The mutism that was thus overcome was of a very different order from the total inability to talk, which was cured in several cases by the shock and mental fright, yet was not entirely unrelated to it. Such cures are always a subject for surprise and comment, and yet are not at all rare in the medical history of humanity. As long ago as Herodotus's time there was a story of a young Persian prince who had lost his ability to talk entirely, and for many years had been absolutely mute, yet who on seeing his father about to be murdered in his palace by invaders regained his voice sufficiently and cried out at once to warn him and to halt the murderers.

With regard to the cure of paralytics emotional shocks are frequently of great therapeutic importance, and especially whenever the paralysis is of functional and not organic origin. If a man is paralyzed because the brain centers that rule over co-ordination of motion are affected by a blood clot or some other result of a recent apoplexy, no shock to the nervous system however severe will bring about recovery. If, however, the paralysis is due to lack of control over the nervous system such as sometimes develops in the course of hysteria, or—to use a less objectionable term because of the bad odor into which that word has come—in the course of a neurosis, then a shock may prove eminently curative, and may indeed be the only agent that will ever enable the patient to regain control of the rather complex mechanism by which locomotion is accomplished. Not infrequently sufferers of this kind are so influenced by the occurrence of a fire that they are not only able to walk immediately, tho immediately before it they are quite bedridden, but are able also to give important aid in rescue work of various kinds requiring the exercise of considerable strength and agility. The emotional strain that causes the cure need not necessarily be of the nature of a fright. An intense religious feeling or devotional emotion may bring about such a reassumption of nervous control. Some

of the cures that are supposed to be miraculous are really of this nature.

Occasionally such a relief from paralytic symptoms occurs also in persons whose ailment originally was of the nature of a serious pathological lesion. A patient, for instance, may suffer from hemorrhage into the brain that causes such complete loss of nervous control as to make it impossible for the sufferer to walk. He may become accustomed to lying in bed, and in spite of the fact that there is a gradual restoration of the nervous system, may not be able to awaken sufficient courage to attempt to get up and resume his ordinary life. Nearly always, when there is an organic lesion of the nervous system, certain hysterical or neurotic symptoms are noted in connection with it, because of the emotional state which develops. Sometimes, then, such patients, tho capable of movement, have not actually moved, and think themselves absolutely paralyzed. A severe emotional shock would, in these cases, have just the same effect as on patients whose paralysis was originally only of functional origin. In a word, the analysis of such cases requires very careful individuation and special attention must be paid to the symptoms of the patient.

Of course, not a few of these cases of supposed cure of serious conditions due to emotional shock relapse before very long. Many of them are an illustration of the power that the human will has even over a diseased organism that will enable it, under stress of circumstances, to overcome even serious pathological conditions. Most of these will give out before very long, and when they do so will collapse completely and rather suddenly, because their store of vitality has been so absolutely exhausted by their almost superhuman efforts to accomplish the immediate purpose. On the other hand, not a few of the patients so cured will remain in good health for the rest of life, or at least until some harassing mental strain, long continued and gradually cumulative, finally steals away from them again the control of their nervous systems.

While these cases then are not so curious or rare as some of the newspaper reports would seem to make them, they

serve to bring home very forcibly the influence of the mental conditions over many of the bodily functions. Perhaps in nothing more than with regard to human health is it true that people go out and borrow trouble. They fear the occurrence of certain symptoms so much that by their very perturbation they actually invite the development of them. On the other hand, deliberate neglect of many bothersome bodily feelings causes them to disappear. At any given moment there comes streaming into the human consciousness a whole boiler factory of sensations which we have learned to neglect. If any person at any time thinks of a particular portion of the body immediately a special sensation will be felt in that part, usually of a more or less unpleasant nature. It is easy by concentration of attention so to exaggerate this as to make it a source of serious annoyance or even of pain. This morbid exaggeration of attention may go to such an extent as to cause inhibition of function. It is this that is overcome absolutely and at once by the fright or sudden emotional strain which thus becomes curative. There is a lesson in it all which he who runs may plainly read; and it was never more needed than by our over introspective generation which pays entirely too much attention to its passing feelings. A goodly proportion of the ill men and women think they have to bear might be thrown off if they could only forget themselves and their intense preoccupation in their feelings, as is the case when, in a moment of intense emotional excitement, their normal selves resume sway.

### Prosecutions for Heresy

THE court which tried Dr. Crapsey has given sentence that he be suspended from the functions of a minister of the Church. This is no more than was to be expected.

In his argument for the prosecution against Dr. Crapsey, Judge Stiness said that the question at issue was not whether the teaching of Dr. Crapsey was true or false, but whether it was what the Church required him to teach.

This is a very serious statement, and we see that it is controverted by the lead-

ing Episcopal Journal of this country, altho we think most of the others would accept it. Is it true that in the Episcopal Church, or other Churches, the question on a trial for heresy is not, whether a doctrine promulgated, such as the virgin birth, or the resurrection of the body, is true, but whether it agrees with the formularies of the Church?

It is very easy to show that in any such trial it ought to be a perfect defense that the teaching complained of is true; for the truth ought to be the only thing sought, as for hid treasure, but unfortunately the fact is otherwise. For this is a court, not a seminar, nor a laboratory, nor any sort of investigation of searchers after truth, but a trial for heresy, a court, the last thing that ought to exist in the Church; and the purpose is not to seek the breadth of the possible Christian faith, but to discover whether the view held by the man on trial is such as can be allowed in this particular fraction of the Church Universal? And how is this to be settled? Not by discovering how broad the Universal Church may be, much less what the truth may be, but what are the limitations which the men who composed the written constitution of the denomination have put on the range of its faith.

That is the reason why a denomination has creeds. To be sure, such a creed is an impertinence, but sects have them. They have them for no other purpose than to limit the range of belief. It is not truth; it is not even the Scriptures that are to be the test, but the particular interpretation of the Scriptures, or the particular view of truth which the denomination has held. The Creed is formulated and promulgated on purpose to be used in such a case as this. Otherwise it would not be necessary to add anything to the Bible.

The Presbyterian Church, for example, has a Book of Discipline, adopted in 1885. Dr. Elijah R. Craven was chairman of the committee that devised it. He fully believed that a Church trial should be solely on the Bible, and not on Creeds, but he could not control the method of trials in his Church "for heresy and schism," which must be based on the failure of a minister to keep the oath he made at his ordination, which was the affirmative answer to the question:

"Do you sincerely receive and adopt the Confession of Faith of this Church, as containing the system of doctrine taught in the Holy Scriptures?"

It is not the Bible, nor the truth, which the candidate gives his sincere adhesion to, but the interpretation of it as found in the Confession of Faith. It is on that that a Presbyterian minister charged with heresy must be tried, no matter what Dr. Craven may have believed. Indeed, we have sometimes suspected him with being half a heretic himself. In the Protestant Episcopal Church the accused heretic is equally hedged about, not by the truth, nor the Scriptures, but the formularies of men. At his baptism he accepted the articles of the Apostles' Creed. At his ordination he promised to give "faithful diligence" "to minister the doctrine" "as this Church hath received the same"; and he is required, at every Sabbath service, to repeat the Apostles' Creed, as his statement of belief. This is his pledge; on this he is tried if faithless. If he were to be tried on his adhesion to the truth, or to the Bible, there would be no need of a fixed creed, the purpose of which is to exclude those who do not hold it, and thus to secure uniformity and permanence of belief.

We admit that this ought not so to be; that there ought not to be creeds and tests, and that the free search of truth is the ideal. But few Churches have reached that ideal, and those that have should guard their privilege.

**Carl Schurz**

Carl Schurz was one of the brave derelicts of the stormy revolution of 1848 that were cast upon our shores. He had tried, and failed, to establish a free republican government in Prussia, and with General Sigel and other soldiers he fled to this country. Never did a man more completely assimilate himself with the new but congenial institutions of his adopted country. He learned the English language so that he possessed its idioms and its intonations as one born among us. He volunteered in our Civil War and obtained distinction as a soldier. After the War he was called in the councils of the President, both as Commissioner of Indian Affairs and as a member of the Cabinet, and was Senator of

the United States. But he was always independent and always looking for the highest interests of his adopted country. He was a great power in the successful movement for civil service reform, and did much to organize the new system. As editor of the New York *Evening Post* he was still critical, but always patriotic and unselfish. He fully believed, at least until his later days, that the people, well instructed, could always be trusted to do right; and they did right in the acquisi-

Carl Schurz.

tion of Porto Rico and the Philippines from Spain, and the attempt to create freer institutions in the Philippines, where Mr. Schurz was utterly against our policy, believing it selfish and unjust. He was a brave, honest, eloquent and noble man, one of the noblest of our adopted citizens, and worthy of comparison with the best of our best men of native birth. Why be jealous of immigrants?

#### The President and Mr. Tillman

policy, and one unimportant personal matter, were brought to the public in the

One serious criticism of the President as to public

statement written by ex-Senator Chandler, and read by Senator Tillman to the Senate. They charged that the President had not shown good faith with the Democratic Senators, whose help he had sought, to secure the adoption of a narrow review by the courts of decisions of the Interstate Commerce Commission as to rates; and that, when he had secured their adhesion, he went back on them and gave his approval to the broad review. On this charge of bad faith the President is naturally sensitive. His letter to Senator Allison utterly denies it, and should be satisfactory. It is a question on which he should have the benefit of his belief and that of other first class lawyers that the right of review has not been widened. The only trouble about it is that the Senators who were favoring the side of the railroads seem to be satisfied. The other matter is the personal one. Senator Tillman, reading from Senator Chandler's statement, declared that, in seeking the support of the Democrats, the President said that Senators Knox, Spooner and Foraker were trying to defeat or injure the bill by ingenious constitutional arguments. Senator Lodge, who holds it his special duty to defend the President, regarded this as a most damaging assertion; and after telephoning to the White House he reported to the Senate that the President had characterized the statement as "a deliberate and unqualified falsehood"; and now Mr. Chandler repeats that it was true. This seems to be a case in which the President is injured by his too officious friend. We take it to be probable that the President had expressed some form of dissatisfaction to Mr. Chandler as to the course of certain Republican Senators. He talks with a great many people, and he talks very freely. He could not believe that he had used the indiscreet language credited to him, and he denied it with heat. Then Senator Lodge, who ought to have reported the denial in more diplomatic terms, as a misapprehension, or misunderstanding, blurted it out in its most offensive way, as the President in his first heat uttered it. It is a small matter, purely personal, but it may make trouble, as it affects personal honor; but the indiscretion is as much that of Senator Lodge as of the hasty President.

### Our Protectorate in Panama

Our authority in Panama has received a very considerable extension by the announcement by Secretary Taft that the Government of the United States would regard an insurrection in any part of the Republic of Panama as so endangering the interests of the United States in the Canal Zone as to warrant our intervention to suppress it, and that a request by the President of Panama would be the best evidence that such intervention was warranted. This means practically that President Amador will be kept in power by the arms of the United States, for it is quite apparent that he would be defeated in a fair election and it is almost equally certain that he and his party would not give up their present position of power and profit without a struggle. The Conservatives are and always have been in a minority in Panama, and they can only keep in power by fraud and force. There is excellent evidence that the first method is being used and the second being prepared for. It is reported from many places that the Liberals are being prevented from registering for the elections of June and July, and the President of the Republic is using his almost unlimited power of removal and appointment of local officials to secure the counting in of the Conservatives. Mr. George W. Jimenez, formerly of the New York police, who has been employed by the Panamanian Government in the organization of the police force of the Republic, states that explicit instructions have been given to the police to prevent the Liberals from voting. The difficulty of the position assumed by Secretary Taft is that he either goes too far or not far enough. He has stated that he will prevent the opposition party from resorting to the customary method of contesting elections in South and Central America—that is, an insurrection—but he has given no assurance that he will intervene to prevent the party in power from resorting to the equally customary methods of maintaining its position by official coercion. He should in fairness exert his influence over President Amador, an influence which so far has had no visible limitations, to insure a fair and peaceable election in the North American sense of the

term, even tho it should result in the selection of a President who is less tractable than the present incumbent.

### Telephone Competition

There is now pending before the Board of Estimate and Apportionment in New York the application of a telephone company for a franchise in order that it may compete with the existing company, which conducts the largest municipal telephone service in the world. In our opinion, the desired franchise should not be granted. The telephone business in a city is a natural monopoly. In such a field the competition of two or more companies, with the attending duplication of plant and organization, causes economic waste that should be avoided. Duplication of service is a nuisance to the business men of a city. The cost of telephonic communication is increased by it so long as two distinct plants are in use. The present service in New York is very good, and the tendency of rates has been downward for some time past. At the time of the thoro investigation made by the Merchants' Association (which was followed by a voluntary reduction of rates), the company definitely committed itself to the policy of regulating its charges by a limitation of its net earnings and of submitting to a supervision of its accounts by public authority. It is possible to regulate rates by legislation whenever the people are convinced that discipline of this character is needed.

### Chancellor Day

Chancellor Day, of Syracuse University, has published a savage invective against the President for his action on Mr. Garfield's report as to the Standard Oil. He charges the President with "monstrous abuse of justice," nothing less than "anarchy," for which perhaps he should be impeached. This is an amazing outbreak, which those who know are ready to explain from the fact that Syracuse University has been receiving large gifts from its trustees who are high in the management of the Standard Oil interests. What is the Chancellor's complaint? He says:

"It means anarchy if judges are to be set

aside and their verdict is held up for criticism by the President."

But judges have not been set aside and their verdict is not held up for criticism. Indeed, the matter is not yet before the courts. He says:

"Mr. Garfield's report is not a verdict. . . . The act of the President in naming a business and its officers in a proclamation, and thereby judging their cause by a brand of infamy or guilt upon an ex-parte statement is a monstrous abuse of justice."

Nonsense. Of course, Mr. Garfield's report was not a verdict. His investigation was by order of Congress, not of the President. When received, it was the President's duty to give it to Congress, with his advice. There is no anarchy or abuse of justice in doing what Congress ordered and the Constitution requires. He charges the President with "interference with the co-ordinate legislative branch of the Government," and cries out that here is an "issue between representative government and autocratic government." This is more nonsense. Congress may be trusted to be jealous of any interference. What did the Senate do when it suspected the President of trenching on its authority in the Dominican matter? The President is a co-ordinate legislative officer. He is directed to advise Congress. All laws must be submitted for his approval. He may give all the advice he pleases and use all his influence. Chancellor Day has simply gone wild. Bishop McCabe says—and we cannot deny it—that his action is "violent, unjust and silly."

#### **Punishment for Lynchers**

It has been published about the country that the Springfield, O., lynchers were let off with a dollar fine. This is not quite a fair statement, altho some were let off easier than that. Two years ago there was a lynching, and there was no special punishment, and the result was that certain vicious elements were waiting for another chance. This came when a disreputable negro shot a brakeman. The first night the mob was led by determined men, and their actions proved that they were working on some well defined plan of vengeance against the more vicious elements. The second night was filled with as wild scenes as

the first, but the mob was composed of a different element. It was made up largely of young boys, "toughs," of whom Springfield has more than her share. The second night the attack was made on good and bad alike, in different parts of the city, wherever there was any considerable number of colored families. It was then that the first arrests were made of twenty-seven men and boys. These were put on trial in police court next morning. The police judge, whose leniency in dealing with criminals is thought by many to be the indirect cause of the reign of anarchy, was appealed to by the Mayor and the chief of police and other officials to make an example of these captured lawbreakers. Three men were convicted of carrying concealed weapons and were fined the limit, \$200 and costs. Nine pleaded guilty to the charge of disorderly conduct, and were fined each \$50 and costs. The remaining thirteen were all, with one exception, mere boys. It was proved that these boys were with the rioters on the second night, but only eight of them were convicted of complicity in any acts of violence; the other five were acquitted. It was these boys who were fined one dollar each and the fine was remitted. We believe this was a weak leniency. But the final chapter is not written. The grand jury, now in session, has made a partial report, and as a result of this report five of the real leaders of the riots are lodged in jail. These, with others that will surely be indicted, will be tried, and the law-abiding element in the city feel that such a lesson will be taught the disturbers of the peace that the recent deplorable scenes will become impossible in the future. A strong and influential Citizens' League has been organized, and is now working, planning and paying for just such a consummation of the matter.

#### **Coming Together**

The vast majority of the people of the United States can be divided religiously into two parts, of whom about sixty-five million, more or less, are nominal Protestants, and fifteen million, more or less, are called Catholics. The Protestant denominations have of late been coming into a closer unity; can a union of Prot-

estants and Catholics be expected? The rector of St. John's Catholic Church, in Altoona, Pa., says, in a printed sermon, that he believes it can be achieved in this century. He declares that already Protestants have mostly ceased to antagonize Catholics, and are dropping the militant elements in their creeds. He speaks of the co-operation of Catholics and non-Catholics in temperance, sound politics and charitable and civic work; in the cordial invitation extended from time to time by the heads of various Protestant educational institutions to representative Catholic clergymen to explain some points of Catholic doctrine. He tells Catholics that there is very little use nowadays in bombarding Luther, Calvin or Henry VIII. It does no good and plenty of harm; that what is wanted is good example, first of all; less boasting of Catholics' past achievements, and more proof of the present power of the faith that is in them; candor in the discussion of historical questions; fairness and courtesy in controversy, especially in speaking of the "Protestant" Bible, which "as a book teaching heresy" belongs to the past. This is a kind of advice whose spirit we would equally commend to Protestants. We need fewer hammerers of heretics and more welders of Christians.

The ten million dollars which Mr. Rockefeller has given for carrying on the work of the Ogden Educational Board will not be "tainted money" long. The work of the Board thus far has been in the South, and has been carried on at the cost of a million dollars given by Mr. Rockefeller. Of this new ten million gift only the interest is to be used to advance education, and it will go to the North as well as the South as needed. The purpose seems to be to make this Board a sort of educational clearing house for the country. It will have to expend about the same amount a year as is now expended by the American Missionary Association.

We do not propose to investigate too closely the reasons why the Mormon Church, or its rulers, has deposed two fugitive polygamous apostles and elected three monogamists to fill vacancies in the

board. It may be that they would not have done this if Senator Smoot were not in danger of losing his seat after a prolonged investigation, the point of which is to show that the Church is insincere in its condemnation of polygamy. We think it very likely that interest has something to do with this expression of virtue, but we remember that hope and fear, rewards and punishments have always had their part in divine and human governments. So we accept the thing done, recognize it as good, believe that it is a step in a reformation that cannot go backward, and put the best construction on it.

That is a most beautiful proposal for reduction of armaments which the British House of Commons said the other day should be referred to the coming Hague Conference. Is it too much to hope that something may then be done? Is it more Utopian than a court of arbitration was when the first session at The Hague was held? A certain disagreeable fact is that all the so-called "Christian" Governments of Europe will be very slow to act, while it is the international Socialists and their allied advanced Liberals that can be depended on to urge the policy. Where does true Christianity lie?

The New York Presbytery has dared to take the ban off from Union Theological Seminary, and has voted to allow its theological students to attend that seminary. They did it anyway, and it is just as well to allow it. But since the condemnation of Professor Briggs, by the General Assembly, and the withdrawal of the seminary from the control of the Assembly, Presbyterian students have not had the liberty to expect aid if they went to Union.

The charge that slavery is still maintained in Portuguese Africa, about Benguela and Loanda, should be closely investigated by the neighboring British authorities. The statements made by Henry W. Nevins, as the result of his own observations, are definite, abundant and terrible. Even America has some responsibility in the case, for some of these slaves are carried in vessels to the neighboring islands.

# Insurance

## The Mutual's English Business

IT is evident that the British public is inclined to skepticism in regard to American insurance matters. This fact is emphasized by very recent happenings in London in which the Mutual Life Insurance Company, of this city, is vitally interested. Incidentally, it may be stated that the Mutual has done, in the past, a very considerable English business. The company was formerly represented and managed in London by D. C. Haldeman. The developments regarding the management of the Mutual and the expenditures of Andrew C. Fields and certain other extravagances and gross abuses created a feeling of distrust on the part of the English policyholders in the Mutual, which has not been allayed by the present reform management. The result has been the withdrawal of Mr. Haldeman as London manager, and of his affiliation with the North British and Mercantile Insurance Company, of London, which company now seeks to take over the Mutual's English business. Cables to *The New York Times* indicate that the so called process of "twisting" is meeting with much success and there appears to be a considerable number of persons now holding policies with the Mutual who are now and will be eager to avail themselves of the North British and Mercantile Insurance Company's offer to reinsure them. The text of the circular issued under the inspiration of Mr. Haldeman, as printed in the *Times* (New York) is given below:

"Each policyholder is to surrender his policy in the Mutual to the North British and Mercantile Insurance Company, and in exchange, upon payment of the same premium as provided in his Mutual policy, is to receive without medical examination and free of all expense, a policy on the same lines as his Mutual policy, but with the usual liberal privileges and

conditions relating to the North British and Mercantile Insurance Company's policy, provided a sufficient number of policyholders assent at once to this arrangement, so as to avoid selection against the office.

"Under participating policies issued since 1898, with fifteen or twenty years' distribution periods, the North British and Mercantile Insurance Company will provide assurance of the same amount as at present and for the same premium, with immediate participation in profits, under the following tables:

"Ordinary whole life premiums during life; ordinary whole life premiums limited to twenty payments, if there are five or more still to pay; endowment assurances for ten, fifteen, twenty, twenty-five, and thirty years.

"In other classes and under all ten year distribution policies, in order to give full face value from the commencement, it will be necessary to defer participation in the profits for an equivalent period, unless the policyholder prefers to pay a slightly increased premium carrying immediate participation.

"Regarding any policies not embraced in the above or those which have no surrender value, a fair and liberal proposal will be made."

The Mutual Life Insurance Company, thru Harrison Hogge, its new London manager, has issued a circular letter warning its policyholders against "the folly of allowing themselves to be carried away by the specious offer" of the English company.

THE present administration of the Mutual Life has decided upon the reduction of its maximum line on any one life to \$250,000. Prior to the reform movement now in progress in the Mutual the company had no policy limit, contracts for \$1,000,000 having been granted to George W. Vanderbilt and some others.

WE very much regret the mistake made last week in the spelling of the word "Central" in the note regarding the American Central Insurance Company of St. Louis, of which George T. Cram is president.

The following table shows the total losses at San Francisco in relation to capital, surplus, etc., of various companies, according to figures submitted to the Insurance Department of New York State:

# Financial

## Railway Earnings

RAILROAD gross earnings for April show an increase of a little more than 11 per cent., which may be compared with  $9\frac{1}{2}$  per cent. in March,  $25\frac{1}{2}$  per cent. in February, and 19 per cent. in January. Returns from a majority of the roads for the first four months of the present year confirm these monthly figures by indicating an increase of 16 per cent. for that period. All this is very favorable, as there were gains in each of these months last year, February excepted. It will be remembered that a long and unbroken series of monthly increases was interrupted in the early months of 1904, to be resumed in August of that year. Since that month there has been a succession of gains (except in February, 1905), and those of this year are unusually large.

## Tin and Copper

SINCE 1878, the price of tin has been multiplied by four. In that year sales were made at £52½ per ton in London, where the price rose on Monday last to £215. Since 1899, the price has not fallen below £100 in that market, which governs the markets of the world for this metal. Supply increases slowly, and the cost of production has been growing. The high price should cause a thorough investigation concerning the tin deposits of Alaska. Tin was found there some years ago, and up to the present time about 400 tons have been produced. A vessel carrying supplies for men engaged in the work near Cape York sailed from Seattle last week. Miners returning to California last year asserted that abundant deposits had been discovered not far from Bering Strait.

Copper in the New York market is now nearly 19 cents a pound. Since ten years ago the world's output has been more than doubled. But while the average price for 1895 in London was £51, it rose to £69 in 1905, and the metal was quoted in that market on Monday last at £87. We produce in the United States more than half of the world's supply and export nearly two-thirds of our output. There is evidence that demand for consumption has not recently been met

by the increase of supply, but the high price should bring into the market mines in which the cost of production is much above the average. The demand is due mainly, of course, to the constantly growing use of copper in connection with the production and utilization of electric power and for the transmission of messages.

....Net earnings of the Steel Corporation for the quarter ending on March 31 were \$36,634,490, or \$13,600,000 in excess of the earnings of the corresponding quarter in 1905.

....Five minutes after the opening of the new Night and Day Bank at Forty-fourth street and Fifth avenue the deposits exceeded \$500,000. At the end of the first twenty-four hours they were more than \$1,000,000.

....Control of all the electric traction, power and light companies in the lower Willamette Valley of Oregon (Portland included) has been purchased by a syndicate of New York capitalists, the sum involved being about \$30,000,000.

....April's output of pig iron was 2,073,645 tons. March, with 2,165,632, still holds the record. In October last the output for the first time exceeded 2,000,000 tons, and in only one month (February) since has it fallen below that quantity.

....Mr. Bell, a British Commercial Agent, in a recent report to the Foreign Office in London upon trade in this country, says there are no signs at present of a decrease of the great activity which prevailed during 1905. On the contrary, he adds, there is every indication that "the present year [1906] will be quite as prosperous as the past, or more so."

....Dividends announced:

International Salt Co. (quarterly), 1 per cent., payable June 1st.

International Silver Co. (first mortgage), coupon, payable June 1st.

N. Y. Cent. & H. R. R. R. (R., W. & O. Division),  $1\frac{1}{4}$  per cent., payable May 15th.

Amer. Express Co. (semi-annual), \$3 per share, payable July 2d.

San Luis Min. Co., 1 per cent, payable July 5th.

VOL. LX

NEW YORK, THURSDAY, MAY 24, 1906

No. 2999

## Survey of the World

### Passage of the Railroad Rate Bill

By a vote of 71 to 3 the Railroad Rate bill was passed in the Senate on the 18th inst. The negative votes were cast by Messrs. Foraker, Morgan and Pettus. A grant of rate-making power had been persistently opposed by the Senator from Ohio, and the two Senators from Alabama held that the bill was unconstitutional, partly on the ground that it violated State rights. Reports, to the effect that if they were present they would vote in the affirmative, were received from all of the fifteen absent Senators, three excepted. No word came from Mr. Depew, or from Mr. Gorman, who is very ill, or from Mr. Burton, who is under sentence on a criminal charge. The bill was reported to the Senate on February 26, and it had been the subject of discussion since March 12. It is generally admitted that in no other Senate debate of recent years has greater ability been displayed. We spoke last week of the important amendments adopted. Since that statement was made there have been very few changes. Pipe lines carrying oil on the Isthmus of Panama have been excepted from the amendment relating to such lines; the number of classes of persons to whom passes may be given has been increased; and (by a vote of 50 to 24) the words "in its judgment" have been eliminated from the clause empowering the Commission to fix a just and reasonable maximum rate. Messrs. Knox, Spooner, Bailey and others argued that these words would make the bill unconstitutional. On the other hand, Commissioner Prouty had urged that they were required to make the bill effective, and some Senators held that they would compel such a limited review by the courts as they desired. It

was understood, however, that the President did not regard them as essential. Before the final vote, brief speeches were made by several who had been prominent in the debate. Mr. Rayner predicted that before the enactment of the bill the President would "again change his mind" and withdraw his support from the Allison amendment. He did not intend to charge the President with any selfish or dishonest purpose, but he found it impossible to follow the changeable processes of reasoning through which the President reached a decision. "His mind," said Mr. Rayner, "resembles a kaleidoscope, which you must shake before its reflecting surfaces exhibit beautiful colors in symmetrical forms. And then, when you have got it adjusted and focussed, it flies into its original fragments and resolves itself into its component parts." The Allison amendment, in his opinion, destroyed the efficiency of the entire bill. The President had weakened the measure, but if he had persisted in his original purpose a few days longer, a united Senate would have passed a bill responding to the exigencies of the hour. Then Mr. Dolliver said that the bill was a perfect response to the President's recommendations. The President was coming out of the fight with every proposition he had advocated written in the statute book. There were millions who would not think less of him for bringing his party unitedly to the support of the principles for which he had so long contended. Mr. Teller said that, while the President had no right to instruct Senators or address requests to them concerning their votes, the bill would not have been passed without his initiative. Mr. McLaurin, asserting that the broadest possible court review was permitted

by the Allison amendment, said that if the President had united his party he had done this by surrendering to the opponents of rate legislation. Mr. La Follette defended the amendments he had offered, saying: "They were voted down by my Republican colleagues, who had been lined up under the leadership of New England Senators to oppose them." The question would not be put at rest, he added, until the Commission should be empowered to determine the real value of the railroad property and to fix rates giving only a fair return upon that value. Mr. Bailey said the bill was probably the best that could be had after the President receded from his original position. If the railroads should fail to obey it, some other Congress would pass a law with teeth in it. The speech-making ended with a brief address by Mr. Tillman. He would vote for the bill, he said, as the best one he could get. His acknowledgment of the President's instrumentality was heard with much interest:

"But for the work of Theodore Roosevelt in bringing this matter to the attention of the country, we would not have had any bill at all. It is true that the idea was not his; that it was announced in three successive Democratic platforms; nevertheless, he seized upon it, and whatever success may come from it will be largely due to him. I cannot congratulate him on his victory, for I think we should have had a better bill."

He would not assert, he continued, that the President had surrendered on the eve of victory. What the President did was done in order that his party in the Senate might be united for the bill. He had had no personal or selfish motive.—It is now expected that the Senate amendments will be accepted by the House. This is reported to be the opinion of Speaker Cannon and also of Mr. Hepburn, who will be an influential member of the Conference Committee.

**Controversy Over the Chandler Negotiations** After the President's statement (to which we referred last week) in response to the assertions of Mr. Tillman and Mr. Chandler, the controversy over the conferences with Mr. Tillman and Mr. Bailey was the subject of remarks in the Senate by these two Senators until the 17th. Mr. Roosevelt said

in his letter to Mr. Allison that he had been asked to see Mr. Chandler as the representative of Mr. Tillman, and that it was with the understanding that Mr. Chandler was such a representative that he asked his secretary to make the appointment. On the 15th, Mr. Tillman commented upon the President's letter, saying that the latter's explanation was "ingenious but not ingenuous." Mr. Chandler, he continued, had declared that the President sent for him for the purpose of getting into communication with Mr. Bailey and himself [Tillman], and had produced Mr. Loeb's letter to prove it:

"I now declare most emphatically that to no human being have I ever given authority, or even expressed a wish, to have any conference with Theodore Roosevelt with regard to the bill now under consideration. On the contrary, I have expressed the opinion in more than one published interview that he had nothing to do with it, that it was the business of the Senate, and while I did, at his request, enter into negotiations with the Attorney-General, it is well known to every Senator on this floor what my attitude and feelings have been, and it is most remarkable, while the President sent for Democrat after Democrat to confer with him about this measure, that he should undertake under the circumstances to assert that I sent an agent to him to begin negotiations. The statement is absurd on its face."

He made the charge that the President was "guilty of bad faith." Mr. Moody, he added, seemed to think that the code of honor among gentlemen was not binding upon the Executive and his Cabinet. On the following day he read a long letter from Mr. Chandler, in which the latter confirmed all his previous statements concerning the conferences. The ex-Senator said he could not avoid the issue raised by the President's telephonic message, altho he could not "use toward the Chief Executive of the nation language like his own":

"I did not go to the White House as a representative of Senator Tillman, but solely because the President summoned me there by the letter from Mr. Loeb, and I waited for him to express his object. It was unmistakably stated to be communication with Mr. Tillman, who had the rate bill in charge, and other Democrats of the Senate, for the purpose of securing the adoption in the bill of a court review clause limiting the inquiry to the question whether the Commission had exceeded its authority or had violated the constitutional rights of the carrier."

He then repeated his former report of

the President's remarks about Senators Knox, Foraker and Spooner. The President had written that he mentioned Mr. Spooner only to express cordial approval of his amendment. This was on March 31st. Mr. Chandler says that the Spooner amendment was not offered in the Senate until May 10th, altho the President might possibly have seen it forty days earlier.

"But if the President had on that night told me he cordially approved of it, and I had so reported to Mr. Tillman, there would have ensued no conferences looking to co-operation; therefore, the President has in mind a conversation at some other time or with some other person."

On the whole, he concluded, he ought to consider himself fortunate. If the old imperialist days had been fully revived at the White House, Senator Lodge, his friend, would have cut off his head and taken it to the President on a charger. Now he had left the power of speech, but he should never use it again "as a missionary from President Roosevelt to the Democratic party." This was the end, so far as the main controversy was concerned, but Mr. Bailey sharply denounced the *Chicago Tribune* and *New York Tribune* and their Washington correspondents for publishing a story that the President had deserted the Democrats because he had learned that Mr. Bailey was suspected of treachery by Mr. Tillman. These correspondents and the man who inspired the statement, "however high the office he holds," he called "deliberate and malicious liars," adding that it seemed conclusive that "the slander had proceeded from the White House." There was no response on the Republican side to anything said or read by the two Senators. It appears that the story complained of had been based upon an incorrect report as to the contents of a memorandum sent to the President by Mr. Chandler, a memorandum suggesting nothing whatever to Mr. Bailey's discredit.

#### For a Sea-Level Canal

The return of Mr. Carmack from Tennessee gave the advocates of the sea-level type a majority in the Senate committee, and a bill directing that a sea-level canal be built, in accordance

with the plan submitted by a majority of the Board of Consulting Engineers, was reported last week. Reasons given are as follows: that the ideal canal is one at the sea level; that it can be made probably with less hazard than one with locks and enormous dams on doubtful foundation; that it would be safer, more convenient, more easily maintained and more economically operated; and that only a little longer time would be needed for construction. A strong argument for the sea-level type is found by the majority in the object lesson furnished by the San Francisco earthquake. The Isthmus, the report says, is not exempt from such convulsions of nature, and the long and high walls of lock basins, unsupported on one side, would be especially exposed to injury. Months or years might be required for restoring locks fractured by a violent movement of the earth's surface. But the only structure proposed for a sea-level canal that could be injured by an earthquake would be the Gamboa dam, which is to rest upon solid rock and be buttressed strongly, and therefore would probably escape. The locks, however, would have less firm foundations. Moreover, in time of war, they could easily be disabled by high explosives. It is also asserted that the locks would soon be outgrown, and that the use of them, when they are arranged in flights of three or two, would be attended with great danger to the gates as well as to large ships. "The wreckage that would result from the plunging down of a great ocean steamer, and the havoc wrought to the canal below, would require years to repair." While the cost of one type would be \$250,000,000 and that of the other \$139,000,000, the higher cost of maintaining a lock canal would represent the interest upon \$40,000,000. This, with \$10,000,000 for submerged land, would increase the cost to about \$190,000,000, so that the difference would be only \$60,000,000. To transform a lock canal into one at the sea level, the report says, would cost \$200,000,000. —Letters from Secretary Taft concerning the purchase of supplies abroad have been sent to Congress by the President. Of the bids recently submitted for two seagoing dredges, the lowest, \$654,000, was from William

Sumers & Co., of Scotland, and the next, \$724,000, came from the Maryland Steel Company. It appears that the bid from Scotland will be accepted, unless Congress shall direct otherwise. More than a year ago the Secretary asked Congress for instructions as to what he should do in such cases, but there has been no response.

#### A Railway's Coal Interests

Pursuing its inquiry concerning the relation of certain railroad companies to the coal industry, the Interstate Commerce Commission and its attorneys have unearthed much interesting evidence as to gifts of coal shares to influential officers of the Pennsylvania Railroad Company. We have room for only a brief summary of the testimony taken last week in Philadelphia. It related to favoritism in supplying cars to mining companies, as well as to the large gifts of valuable stock to officers controlling the distribution of cars. The inference fairly to be drawn from the statements of mine-owners and the admissions of the railway company's officers was that there had been unjust discrimination in favor of the coal companies from which shares of stock had been received or in which prominent officers of the railway company were otherwise interested. The following facts were disclosed, in most cases by the admissions of the officers themselves while on the witness stand: R. L. O'Donnel, general superintendent of the Buffalo and Alleghany Valley division, received as gifts shares in eight coal companies while he had charge of the distribution of cars on the Pittsburg division. The Jamison Company holds 200 shares of its stock in trust for him. George W. Creighton, general superintendent between Philadelphia and Pittsburg, while controlling the distribution of freight cars, received 1,190 shares from several companies. He now owns them, and they pay from 12 to 20 per cent. Under orders from headquarters he made special allotments of cars, one favored company receiving for a time on such an order 500 cars per day. Michael Trump, general superintendent of transportation, received shares from several companies. It appeared from his testimony that in a time of traffic congestion

1,000 cars were sold by the railroad company to the Berwind-White Mining Company, and 500 to the Keystone Coal and Coke Company, of which R. K. Cassatt, the president's son, is vice-president, and in which many of the prominent officers of the railway company are interested. To George W. Clark, chief car clerk, were given 100 shares of Jamison stock, with shares in other companies. J. B. Alldred, chief clerk of the superintendent of the Pittsburg division, admitted that he had received shares having a par value of about \$45,000, the annual income of which was \$8,000. Joseph Boyer, chief clerk of the superintendent of motive power, has 100 shares of Jamison stock. To Edward Pitcairn, cousin of the president's assistant, and a freight trainmaster, were given 200 Jamison shares and also shares in other companies. For 600 Keystone shares, now worth \$30,000, and yielding 8 per cent., he was permitted to pay \$500. Mr. Jamison testified that he offered 500 shares, through an agent, to Robert Pitcairn, President Cassatt's assistant, but afterward sent a check for \$5,000 to buy back the shares, because he was told that Mr. Pitcairn preferred the money. The Keystone Coal and Coke Company, according to the testimony of its manager, is one in which a long list of the railway's officers are interested. Its president is Congressman George W. Huff. Vice-President Pugh is one of those who hold stock in several companies. It was asserted that preferential treatment of much value had been given to the Berwind-White Company at the tidewater terminals and elsewhere. President Cassatt is in Europe. First Vice-President Green has published a statement saying that these disclosures are a surprise to the management, that an investigation will be made, and that no ownership or practices tending to prevent impartiality will be tolerated.

The Philippine Islands Governor Curry, of Samar, has been authorized by the Commission to make a campaign with fourteen companies of infantry on his island for the absolute subjugation of the outlawed Pulajanes. While the regulars scour the

island, the army stations will be garrisoned by the scouts and constabulary. —All the troops in Luzon, about 3,000 men, are to take part in extensive field movements in the northern provinces, with a view to the effect of such a demonstration upon natives who sympathize with Salvador, the leader of a band of ignorant and superstitious fanatics. He is said to have 400 active followers, and it is estimated that 30,000 natives in four provinces (in a population of 1,000,000) look with favor upon him and his band. While the troops are exhibiting themselves, the outlaws will be attacked by the constabulary. Salvador and his men are enemies of all organized society rather than opponents of American rule. —Under the law of 1904, requiring that coal for the navy be transported only in American ships, the cost of shipping coal to Manila has increased about 50 per cent., the additional expense thus far having been about \$400,000. Secretary Bonaparte recommends that the law be repealed.

#### Various Topics

It has been decided by the Supreme Court that United States Senator Joseph R. Burton, of Kansas, must suffer the punishment imposed by the sentence of the Circuit Court in Missouri, which is imprisonment for nine months in jail, a fine of \$2,500, and the loss of his right to hold office under the Government. Justices Brewer, White and Peckham dissented. Sixty days were granted in which to prepare a petition for a re-hearing. This will take the case over to October. If the Senator does not resign, it is expected that the Senate in December next will declare his seat vacant. —Senator Bulkeley, of Connecticut, president of the Aetna Life Insurance Company, said to the House Committee on the Judiciary, last week, that the Armstrong investigation and the legislation due to it would not better conditions in the great life insurance companies, but would have a contrary effect. The irregularities disclosed, he asserted, had been caused wholly by the jealousy of financiers striving to obtain control. As a result of the investigation, the great companies would go into the hands of one man. He ad-

mitted that in 1896 he had given \$5,000 from his company's treasury to the Republican campaign fund, saying that he would have been justified in making the contribution \$20,000. —Ex-Governor Robert L. Taylor, of Tennessee, has defeated Senator Carmack at the primaries in a contest for the seat which the latter now holds. —It is reported in Salt Lake City that the Mormon Church will withdraw from business enterprises, and has made a beginning by selling its traction and lighting company to a corporation capitalized at \$25,000,000. —Additional land fraud indictments were announced in Portland, Ore., last week. Sixteen men are accused, and a majority of them are prominent residents of Los Angeles, Cal., among these being the president and cashier of a bank and two physicians.

#### The French Elections

The second election of members of the Chamber of Deputies took place on Sunday, May 20th, to decide the 155 cases in which no candidate received a majority of the votes cast in the election of two weeks ago. This second election confirms the result of the first, and proves that the anti-clerical policy of the present Government has the general endorsement of the people, for 140 supporters of the Government were elected to 15 of the Opposition. The Sarrien Ministry will have some 57 more votes added to its majority by the elections. The Chamber of Deputies may be regarded as divided by a vote of 407 Ministerialists to 179 Opposition on any important issue. The position of the Government, however, is not as decisively strengthened as these figures would indicate, for the chief increase has been made by the Socialists, who will naturally take a more independent attitude in the Chamber, and will refuse to join with the other radicals in support of the Ministry on certain issues. The United Socialist party increased its strength by about one-third, which will give it a total popular vote of about 1,000,000 in France. Minister of the Interior Clemenceau, who is the real leader of the Government, will doubtless have some difficulty in keeping all factions to the

support of his policy, which is "neither Clericalism nor Collectivism." The French Nationalists, especially the followers of the late General Boulanger, met with defeat at the polls. Conspicuous among them are Paul Déroulède, founder of the League of Patriots, recently returned from exile in Spain; Colonel Marchand, once "the hero of Fashoda," and Major Briant, son-in-law of General Boulanger. Maître Labori, the lawyer who defended Dreyfus and Zola, was elected. The strikes still continue in many parts of France, the most serious one being in the automobile works, which are many months behind their orders, on account of the great demand for machines. French employers are beginning to organize to oppose the organized working men. All the manufacturers of machines and tools have formed an association, with a paid-up defense fund of \$1,200,000, and are pledged not to accept an eight or nine hour day, and not to permit the interference of unions with the management of their works.

**The Italian Cabinet Resigns** The Cabinet of Baron Sonnino, which has only been in power since February 8th, has resigned on account of being defeated by a vote of 27 on a minor question of procedure in relation to the nationalization of the railroads. The cabinet has never manifested much strength, and has not succeeded in getting thru any measure except one for the relief of the poverty-stricken provinces of the south of Italy. Its defeat is due to a variety of causes. Admiral Mirabello, who, however, was taken over from the former Ministry, was under fire on account of the scandals in naval contracts unearthed by a parliamentary commission. In a strike of the employees in the textile and automobile factories of Turin, the police in defending the shops against an attack of many thousand strikers fired into the mob. The strike was settled on the following day, but the labor leaders were infuriated by the action of the authorities in ordering the use of arms, and ordered a general strike all over Italy as a protest. In the Turin affair only five

of the strikers had been wounded by the firing, while twenty-six soldiers and police had been previously injured by the stones of the mob. The general strike was called off after a day of demonstrations in the cities. The Socialist members introduced into the Chamber of Deputies a bill to prohibit the use of firearms by the police in suppressing street riots, and when the Chamber refused to consider it they resigned in a body. In consequence of these embarrassments the Ministry decided to retire without a struggle. The leader of the Opposition, Signor Giovanni Giolitti, former Premier, will be asked to form a new Cabinet.

**The Demands of the Duma** The parallel so often noted between the Duma and the French States General at the beginning of the French Revolution continues to be very striking. Emperor Nicholas II is pursuing the same policy as King Louis XVI in interposing between himself and the demands of the people the futile conventionalities of court etiquette and with the same result—that the demands of the people are becoming more definitely formulated and their representatives are coming to realize their essential unity and to recognize their real power. So far the attitude of the Duma is one which might serve as an example to many older Parliamentary bodies. It has kept its extremists of both wings in harmony with the majority and has refused to be turned aside from its main purpose by the petty provocative acts of the court party. The Reply to the Address from the Throne is a clear, consistent, though very radical, program of political reform. It was not finally voted upon until two o'clock in the morning of Friday, May 18th. The long debate was caused not by any important opposition or disagreement as to its revisions, but because almost every member of the Duma wished to put himself upon record by a declaration of his principles. Speeches were limited to five minutes each, and the peasant members of the Duma insisted upon holding the body in session almost continuously, fearing lest the Duma might be dissolved before its demands were stated. In the reply to the

Emperor the question of the demand for full political amnesty was made foremost and most emphatic as the first pledge of mutual understanding and agreement between the Czar and the people. The Duma insisted that no reform of social conditions was possible unless there was a precise law assuring the inviolability of persons, liberty, conscience, speech, the press, association, meetings and strikers. The equality of all citizens before the law must be established, all questions of national and religious privileges must be abolished, and the country freed from administrative tutelage. The death penalty must be abolished, the ministers must be made responsible to the people in order to prevent the name of the Czar being used to cover administrative acts of violence. The Duma will at once proceed to the examination of the needs of the peasantry, and its satisfaction by the appropriation to them of the Crown domain and monastic lands, and the compulsory expropriation of the land belonging to the nobility and the Church. The other demands incorporated in the Reply are that no new taxes shall be levied without the consent of Parliament, and that appropriation bills passed by the Duma shall not be altered by the Council of the Empire, and that the Duma shall have control of all loans. The chief amendment made to the Reply on the floor of the House was that providing for the extension of political rights to women, the peasants insisting upon a direct and universal suffrage. Several strong speeches were made in favor of the complete termination of the subjection of women. The address was adopted by an unanimous vote; Count Hayden stated that he and his friends of the Right, altho approving of the address in general, were unable to vote for certain details, and would withdraw in order that no opposing voice might be heard. He left the hall followed by seven members. In the Council of the Empire a Reply to the speech from the throne was of a neutral and commonplace character. The only address of significance was that of Count Witte, who spoke in opposition to a general amnesty, on the ground that it would encourage another revolution. The all-

pervading hatred which had brought troubles on Russia was in no wise connected with the oppression and misrule, but was due to purely economic causes. He would grant amnesty only to those who had been carried away by the excitement of the moment. Excesses had been committed in the excitement by both people under the authorities. If the revolutionists were released the country would be plunged into the horrors of another revolution, which would ruin Russia and make the whole civilized world stand aghast. When the President of the Duma went to the Peterhof Palace to arrange for the reception of himself and the delegation from the Duma bearing the Reply to the Emperor, he was met with a refusal. It was stated that the delegation from the Duma would not be received in person by the Emperor, but the address would have to be transmitted thru Baron Fredericks, Minister of the Imperial Household. This was regarded as an affront to the Duma, and doubtless was intended as such, but in the caucus of the Constitutional Democrats the cooler heads among the leaders succeeded in convincing the members that it would be very unwise to take direct issue upon this point and break with the Czar upon a question of etiquette. It was explained by Prof. Maxim Kovalevsky, of Kharkoff, that in both Great Britain and Germany the Address was transmitted thru the officers of the Court, altho in early days in England it had been customary for Parliament to proceed to the palace in a body to present their Address to the Throne. The Duma accordingly proceeded to the discussion of the Agrarian Bill, which provides for the partial expropriation of land at a fair price from certain private properties, which with the State, Crown, monastic and ecclesiastical lands will be formed into a State reservation, from which the peasants will be able to obtain allotments on long leases under the supervision of local committees. It was hoped that the Czar would on his birthday, May 19, issue a proclamation of amnesty liberating at least part of the 70,000 persons now imprisoned for political crimes and violence, but the occasion passed without any manifestation of Imperial clemency, an omis-

sion which has greatly increased the feeling against the Emperor.

**Chinese Nationalism** The action of the leaders of the "China for the Chinese" movement in placing the customs service under native control has been met by the opposition of all the foreign Powers. The service has ever since 1863 been under the direct management of Sir Robert Hart, an Irishman, who was made Director General of the customs in that year in order to insure the proper collection of the duties which were pledged for the payment of the foreign loans. His administration of this difficult position has been extraordinarily successful. He suppressed the Chinese and Malay pirates, erected lighthouses along the coast, and established a postal service. On account of his long service and his justice, fearlessness and honesty, he became the one man universally trusted by foreigners and Chinese alike. An imperial edict published May 9th places the customs service, including Chinese and foreigners, under the control of two Chinese who are conspicuous in the anti-foreign movement, Tieh-ling, president of the Board of Revenue, and Tang Shao-yi, the Yale graduate, who recently negotiated the Tibetan treaty with England. The object is to secure more revenue for the great northern army, which Yuan Shih-kai, Viceroy of Pechili, is developing. It is not expected that Sir Robert Hart will be immediately superseded, but it is feared that the interests of foreign bondholders will be endangered if the customs pass into native management. The representatives of all the foreign Powers at Peking are reported to have joined in a protest against the change, but the attitude of Germany is causing some uneasiness in England, since the Kaiser is known to have been giving encouragement to the Chinese national aspiration by advising them to create a strong army and throw off all dependence upon Japan. Under the circumstances it is doubtless significant that the British Foreign Office takes occasion to deny the rumor that Great Britain intends to evacuate the port of Wei-hai-Wei, which was leased to her during the

Russian occupation of Port Arthur. It is explained that this has become impossible since the Russo-Japanese war, for Japan has expressed a desire that her ally should hold that port in her interests. Wu Ting-fang, ex-Chinese Minister at Washington, has petitioned the Throne in favor of several reforms. He asks for the introduction of trial by jury, of permission for native lawyers to practice before the courts, and for the execution of criminals by electricity instead of decapitation. Wu is reported to have become a vegetarian and a teetotaler under the influence of Mrs. Henderson, of Washington, who recently poured all her store of wines and liquors into the gutter.

**German University Doctorates** The number of doctor promotions in Germany is singularly out of proportion to the attendance, as is seen by the following report for the past academic year: Berlin, 227 (7,503); Bonn, 118 (2,294); Breslau, 114 (1,770); Erlangen, 170 (982); Freiburg, 138 (1,331); Giessen, 119 (1,071); Goettingen, 145 (1,370); Greifswald, 138 (687); Halle, 119 (1,753); Heidelberg, 172 (1,359); Jena, 123 (826); Kiel, 170 (758); Koenigsberg, 72 (925); Leipzig, 545 (3,372); Marburg, 100 (1,154); Munich, 289 (4,609); Munster, 28 (1,204); Rostock, 305 (519); Strassburg, 102 (1,333); Tübingen, 107 (1,387); Würzburg, 150 (1,283). In general it is evident that the Prussian universities are most inclined to make haste slowly in bestowing the doctorate, the only exception being Greifswald, which is under a cloud in other respects, too, in matters of strict discipline. Some of the faculties are exceedingly slow with their degrees. Altho Berlin had 2,565 law students, it honored only four with degrees. The theological doctorates of all the universities together do not amount to twenty in a year. The most liberal and reckless in degrees is the smallest university in the Empire, that of Rostock, which proportionally gave this degree 1,247 times as often as Berlin. Naturally the quality of a Rostock doctorate in public estimation is any thing but the highest.

# The Cure of Graft

BY W. J. GHENT

AUTHOR OF "OUR BENEVOLENT FEUDALISM," "MASS AND CLASS."

THE thick-and-thin defenders of the existing *régime* are stoutly protesting against further mention of graft. There has been too much of this talk, they say; it destroys confidence in our institutions, faith in our commercial and political leaders, and it shakes the foundations of the Republic. Moreover, they assert, there is not so much graft at large as the exposers allege. What there is, they say, is only sporadic and incidental; and, besides, it will cure itself, or be cured by a growth in individual morality, or perhaps by an awakened "social conscience." Anyhow, let us talk less about it, and go our way in peace, firm in our faith that all things are working out for the best. The man with the muck-rake must go.

This silly optimism—when it is optimism, and not the deliberate attempt of subservient retainers to throw the public from the scent of evil—is but a reasoned form of the instinct of the ostrich. By blinding our eyes to what is going on around us we expect immunity from harm. But no such immunity will come by reason of recourse to any such method. Graft continues, ever increasing in extent and in the variety of its manifestations, and becoming ever more subtle. When restrained in one place, it breaks out in many other places; when abolished in its grosser or more obvious forms, it appears immediately in a thousand more ingenious forms. Its incentive lies in our mode of producing and distributing commodities; and while that endures, graft will endure. Ceasing to speak of it will only accelerate its growth. The motive, conscious or sub-conscious, of most of the champions of silence is their apprehension regarding the stability of the *régime*. In so far as they are conscious of their motives, they want graft-talk to cease because they want the present order to remain.

There are two main kinds of graft—public and private. The former is merely an outgrowth of the latter, and need not

here be considered. Private graft is the gain made by misrepresenting, extorting, cheating or swindling in the ordinary processes of industry and commerce. It differs from public graft in being apart from the public service, municipal, State or Federal. It is not all of it illegal, since the law, traveling with a leaden heel, cannot keep up with the increasing craftiness of men compelled to compete with one another for the means of life. And it cannot always be defined, or known for just what it is, since men's judgments about it differ in accord with their material interests. What is graft to the victim, or even to the onlooker, is usually "legitimate business" to the beneficiary.

The ramifications of graft extend virtually thruout all business. As Prof. Lester F. Ward writes in his "Pure Sociology":

"Deception may almost be called the foundation of business. . . . There is a sort of code that fixes the limit beyond which this form of deception must not be carried, and those who exceed that limit are looked upon somewhat as is a pugilist who 'hits below the belt.' But within those limits everyone expects every other to suggest the false and suppress the true."

This graft reveals itself in the "doctoring" and adulterating of food, drink and medicine; in the sophistication of virtually all other classes of commodities for personal and household use, and in the various manipulations of insurance, banking, promoting and financing enterprises. Even literature and the other arts are not free from it. They take on, despite themselves, an impress from the prevailing code, and thus reveal some of the more salient phases of graft.

The extent of graft in the making and selling of commodities would seem to be determined only by "what the traffic will bear." Where debasement or substitution is profitable there debasement or substitution is found. There are certain commodities which obviously cannot be substituted. No Loeb has yet succeeded in making an artificial sirloin steak.

Fresh fruit is also so far immune from substitution. Cheap and small oranges may possibly be transformed into blood oranges by injections of anilin, and California prunes may be expanded into "French" prunes by a treatment of glycérine; but no Burbank has yet created a "synthetic" prune or orange. That the meats and fruits of the market remain real meats and fruits, while ground pepper resolves itself into cocoanut shells, and much raspberry jam into anilin, glucose and timothy seed, is due to the fact that in the one case substitution is easy, while in the other case it is so far impossible.

It is in the cheaper grades of goods that the commodity graft finds its working field. Under the competitive system of industry goods are made primarily for sale, not for use; and the main concern of the manufacturer and dealer must lie in the potentialities of selling. The greater temptation would naturally lie in debasing the dearer commodities—if only such commodities could be sold. But those who buy the dearer commodities have obviously the means to make effective their demand for good qualities, and they will not take the poorer. It is not in the expensive cloths that shoddy is found, nor are the expensive fruit-spreads the ones that are made of glucose and anilin. It is thus upon the working class that the burden of debased commodities mainly falls. The working class produces the standard commodities, but it cannot buy them back. It must take the debased commodities, which are sold within the price it can pay.

Let us see what are some of the deceptions and debasements in the important matter of food, and their relation to the total food supply of the average working-class family. All such deceptions are not harmful to health; but they are all swindles, whether harmful or not. There may be a valid argument for "synthetic" food and drink—for eggs made of chemical albumen and for wine that never saw a vineyard; and the man of the future may come to find a ten-days' ration in a vial from a laboratory. But no one can rightly plead that the manufacturer and dealer have the right to exact profit from the consumer for a delusive commodity.

The consumer must know what he is getting, and society must guarantee him this right. If, as Dr. H. W. Wiley has suggested, he wants to eat salicylic acid or pulverized rock, let him; but it is the duty of society to see that he does not get salicylic acid or pulverized rock when he pays for tomato catsup or baking powder.

The United States Bureau of Labor in 1904 analyzed the household budgets of 2,567 working class families. They are not typical budgets, it must be said, but exceptional ones, since these families, averaging 5.31 persons each, had an average yearly income of \$827.19. The average working-class family in America has nothing like this income. Fifty-one per cent. of the unskilled shoe-workers of the nation receive less than \$300 yearly. The general run of textile operatives receive but little more. The Pennsylvania bituminous coal miners receive but \$418.15, and the anthracite miners \$684.78 (1904). The 1,300,000 railway workers, including all the salaried officials, average but \$631 (1903-4), while the highly paid steel workers receive but \$710 (1905). The normal working-class family, even allowing two bread-winners to each, will probably not average more than \$600 a year. The figures are of the utmost importance in considering the relation of household budgets to deceptive and debased foods; for the lower the income the more the family is rendered the prey of adulterations—the more it is forced to renounce the solid and nutritious foods wherein adulteration is least, and the more it is forced to have recourse to the less nutritious foods, including stimulants, condiments and the like, wherein adulteration is greatest.

Meat, salt and fresh, furnishes 28.45 per cent. of the value of the food consumed by these families. This is a high percentage, the actual one for all working-class families being more likely in the neighborhood of 20 or 23. Meat, as has been said, is not yet subject to substitution. But it is, in no slight degree, subject to debasement. If the reports of the special correspondent of the *London Lancet*, of Mr. Upton Sinclair, of the special agent of Doubleday, Page & Co., and of many other investigators are to be believed—and most persons will continue

to credit them until something is given in refutation more substantial than the wild and windy utterances of the average defender of the Beef Trust—the meat slaughtered in Chicago does not, by a large margin, meet the standard requirements. These requirements, formulated by the United States Food Standard Commission and the Executive Committee of the National Association of Pure Food Commissions, declare that standard meats should be the “sound, dressed and properly prepared edible parts of animals in good health at the time of slaughter.” The meat furnished from Packingtown is not invariably, perhaps not usually, “properly prepared,” and it is not always the “edible parts of animals in good health at the time of slaughter.” It is, moreover, subject to further debasement until it finally gets to the consumer. The Food Commissioners have been usually too busy with other commodities to bother much about meat. But one of them, Prof. E. F. Ladd, of North Dakota, has investigated the retail shops of his State, and gives the following interesting testimony:

“More than 90 per cent. of the local meat markets in the State were using chemical preservatives, and in nearly every butcher shop could be found a bottle of Freezem, Preservaline or Iceine, as well as Bull Meat Flour. The amount of borax or boracic acid employed in these meats varied to a considerable extent, and expressed in terms of boracic acid in sausages and Hamburger steak would probably range from 20 grains to 45 grains per pound, while the medical dose is from 5 to 9 grains per day. The use of these chemicals is not confined to the local butchers; scarcely a ham could be found that did not contain borax.”

In smoked and dried meats debasement is largely a matter of the use of harmful preservatives. But in canned meats the deception is carried to the extreme of outright substitution. Says Prof. Ladd:

“In the dried beef, in the smoked meats, in the canned bacon, in the canned chipped beef, boracic acid or borates is a common ingredient. . . . One might suppose that the meats offered for sale in the State would be, generally, pure and true to name, but while potted chicken and potted turkey are common products, I have never yet found a can in the State which really contained, in determinable quantity, either chicken or turkey.”

Lard, which claims 2.86 per cent. of the value of the food budget, may also be mentioned here, by reason of its sup-

posed kinship to meat. It is very generally adulterated. Forty-nine per cent. of the samples reported examined in the Connecticut report for 1903 were “grossly adulterated” with cottonseed oil. There is also a thing called “compound lard”—tho it is not likely that the qualifying word is generally revealed by the dealer to the average consumer—which is made almost wholly of cottonseed oil, tho occasionally paraffin shares its company. “Real lard,” says the report, “is a minor constituent.”

Milk, butter and cheese form the second highest number in the food budget, 16.12 per cent. of the total. The adulterations and debasements in this category are both so extensive and so intensive that space cannot be given for enumerating them. In spite of laws for the inspection of milk in most of the States, its “dosing” with formaldehyde and its adulteration are general. The cheaper grades of condensed milk are almost all frauds. Cheese is rarely the thing it pretends to be. Plenty of “imported” cheese is made in this State, and plenty of “full cream” cheese has been, in its liquid state, carefully divested of its creamy cover before undergoing transformation. Moreover there is in the market, according to Dr. Lederle, “cheese made of lard, cottonseed oil and metallic salts,” tho in what quantities we are not told. Oleomargarine is still sold for butter, and a thing known as “renovated butter,” temporarily transformed, according to Commissioner Blackburn, of Ohio, from “unsalable butter in various degrees of putrefaction,” is sold in large quantities. But a new process of “faking” butter, which is no more than the solidifying of skimmed milk, threatens an overflow of the markets, particularly in Canada, where it is now being unloaded.

Vegetables count for 9.72 per cent. of the food budget. In their native form they are, of course, impossible to substitute. The canned goods, however, are very generally “freshened” or colored with chemical salts and preserved with boracic or salicylic acid. Peas, string beans, asparagus, corn and tomatoes are all subject to this manipulation.

Sugar and molasses count for 5.34 per cent. Crystallized sugar is generally pure,

but pulverized sugar is very liberally adulterated, and most, if not all, of the popular brands of maple sugar and syrup are substitutions. Molasses and fancy syrups are chiefly glucose.

Eggs count for 5.14 and poultry for 2.90 per cent. Despite the apparent difficulty of fabricating eggs, the thing is said to have been done with a fair degree of success, tho it is believed the business has declined. As for real eggs, the deception to the consumer is largely one of pretense as to comparative freshness. There are three or four categories of eggs in the markets, such as "strictly fresh, country-laid eggs," "strictly fresh eggs," "fresh eggs" and just "eggs." But they all come to the city consumer, as a rule, from the same kind of cold-storage warehouses, and bear dates ranging from three months to twelve months, or even longer. Whether they are any the better or the worse for their prolonged hibernation is a matter not yet fully determined. Eggs, however, are sold in other forms than encased in shells. "Bottled egg" is one of these, and "eggflake" is another. These are used largely by bakers and confectioners, and they come, if the new inspection laws have not yet intervened, from Northern China and Manchuria. The antique eggs of that part of the Orient are assembled at Newchwang or Tientsin, broken, mixed and "dosed" with boracic acid (five or six pounds to the 100 pounds of eggs, says Dr. Wiley) and bottled or dried into flakes. "They are used," says Dr. Wiley, "by the most prominent caterers in making fancy cakes." Poultry, in its ordinary form, is, of course, beyond substitution or adulteration. What passes for poultry in cans, however, is another story, which has already been related.

Flour and meal claim 5.13 per cent., and bread 3.81. Not much can be alleged against the purity of the ordinary flour and meal, altho the so-called gluten flour, which is generally sold, has been shown by repeated investigations to be largely fraudulent. The case against bakers' bread is a much stronger one. The intervention of the State against the natural law of the business world has brought about marked improvements, but in spite of inspection laws the conditions under which bread is made are generally

known to be highly unsanitary. Then, too, the malt whitening process makes it easy and profitable to use inferior flour, and this is largely done. The "chalk and alum and plaster" of which it was once made, and the "human perspiration, mixed with the discharge of abscesses, cobwebs, dead black beetles and putrid German yeast," with which it was once liberally blended, have probably been largely reformed out of it, tho it is still freely "dosed" with alum.

Fruit comes to 5.05 per cent. Here is another commodity which in its ordinary form defies "doctoring." Canned or dried, however, it suffers a fate similar to that previously related of vegetables; while in the form of fruit-spreads it is subject to the most brazen and wholesale debasement or substitution. It would be idle to attempt to repeat or even summarize in this place what every Food Commission in the country has declared regarding the prevalence of adulteration and outright substitution in this class of goods.

Coffee and tea claim 4.90 per cent., of which tea represents about one-third. Virtually all sales of coffee to the consumer are fraudulent in one way or another. The average person who thinks he knows what he wants will almost invariably ask his dealer, when purchasing, for Mocha and Java, and it would be a queer sort of dealer who should reply that he had none. And yet, as 98.9 per cent. of all coffee imported into the United States comes from Latin America, it is evident that very few persons in this country have ever tasted either Mocha or Java. In addition to this wholesale deception, coffee, especially when ground or pulverized, is very generally adulterated with beans, peas, barley and other and less wholesome substitutes, while coffee "essence" and "coffee compounds" are almost invariably fraudulent. Tea is carefully inspected at the ports, and only a small quantity of really doctored leaves find their way here from abroad. But there is considerable "touching up" with graphite, adulterating and even substituting within the country. "You get tea that grew up in the Bronx woods," said Dr. Lederle recently, and it is highly probable that other sylvan regions, as well as some

more urban ones, furnish their quota of deceptive leaves.

Fish is listed at 2.45 per cent. Professor Loeb has already proceeded as far as a quasi-synthetic sea-urchin, and we may, perhaps, look to a time when our fish comes to us, not from the sea, but from a laboratory. For the present, however, despite the competitive incentive to produce a substitute, the market affords only the natural species. There is a good deal of seizing and destroying of superannuated fish by the health authorities, a good deal of transforming of one kind of fish into another by our restaurant keepers, and perhaps a certain amount of "touching up" for rejuvenating purposes by our market keepers. According to a European report, fish spoiled in spite of ice and borax is treated with salts of zinc, aluminum and other metals. Rubbing it with vaseline to give it a fresh look, and covering the gills with fresh blood or eosin—a coal-tar color—is also said to be resorted to. Whether such practices obtain in America is not reported in any of the official publications at hand.

Vinegar, pickles and condiments are listed at only 1.26 per cent. No one acquainted with the food of the poor in a great city would accept these figures as typical. The real percentage—among the city poor at least—is considerably higher. The stinting of nourishing food develops an abnormal craving for acids, spices and peppers, which the poor buy in large quantities. This whole class of commodities is subject to the most shameless adulteration and substitution. The essential oil is extracted from the clove, and the mere shell is sold for the real article. Cinnamon is subject to wholesale substitution, as are also ground pepper, spice and mace. The flavoring essences are nearly all fraudulent. Vinegar is virtually all a chemical product, olive oil is very often, either in part or altogether, cottonseed oil, and catsup is generally colored with coal-tar, sometimes with cochineal, and preserved with salicylic, boracic or benzoic acid.

A wide range of edibles is comprised in the final entry, "other food," with 6.24 per cent., or including rice, 6.87 per cent. This total doubtless includes cocoas and chocolates, candy, cake and ice cream, breakfast foods and a host of articles

such as baking powders and cream of tartar. Cocoas and chocolates are very frequently adulterated, sometimes with no more than an excess of starch, wheat flour or maize, but in other cases with foreign fats and insoluble matter. Candy, and particularly cheap candy, is largely adulterated. Said Dr. Lederle two years ago:

"It is, or was, hard to get pure candies. Years ago we found candies actually colored by poisonous colors, one of which was chrome yellow. Then terra alba, a white mineral, was used for 'loading' candy and cheapening it. So far as flavors are concerned, natural flavors have been almost entirely replaced by artificial compounds made by the chemist in the laboratory."

A more recent statement is that founded upon an investigation made in 1904-5, under the supervision of Dr. Joseph F. Geisler and Dr. E. G. Love, for the New York State Board of Agriculture. Two hundred samples of candy purchased in New York city were found to contain paraffin. Red and blue anilin and a sort of chemical varnish were used for coloring, and nearly all the cheap candies contained glucose. Glucose has its friends and its enemies. It is, according to Dr. Geisler, "a cheap vegetable sugar produced for commercial purposes by treating starch with dilute sulphuric acid. It is dangerous to health."

Still another statement, that of Paul Pierce, Superintendent of the Food Exhibit at the St. Louis Exposition, declares that:

"Saccharin, the powerful, irritating sweetening, often containing arsenic, is the sweetening element in much of the candy on the market. Foreign governments prohibit its use. Terra alba, barytes, talc, and other deleterious mineral substances and poisons are also found in candy."

Much of the cake in the cheaper bakeries is unfit to eat, and as for the ordinary ice cream it would be more appropriately named frozen starch and skimmed milk. Cream of tartar and baking powder are variously adulterated or substituted, much of the former being nothing more than plain bicarbonate of soda. A report of the New York State Board of Agriculture in 1904 declared eight of seventeen samples to be substitutes.

There has been considerable improvement in the character of food importations since the new inspection laws have

gone into effect, and the few advances in the matter of State inspection and label laws have also had a good influence. But it is, as a rule, only by State intervention that any improvement is made. Left to itself, the natural processes of competitive production result in a constant debasement of goods. Not in all goods, since there is an effective demand for the better qualities, which must be met. But below this line of assured qualities for an effective demand, the struggle invariably means progressive deterioration. Here are fourteen categories of food used by working-class families, in at least eleven of which, either by misrepresenting, misbranding, producing under vile and unsanitary conditions, "doctoring," adulterating, or outright substituting, the customer is defrauded of what he pays for. Omitting fish, poultry, flour and meal, fresh vegetables (probably two-thirds of the total under the head "vegetables") and fresh fruit (probably one-half of the total "fruit"), we have categories representing 81.51 per cent. of the food supply in which deception in one form or another is more or less common, and but 18.49 per cent. in which deception is uncommon, and then mainly because it is impossible.

Guesses at the quantitative and qualitative extent of food deception are of course hazardous. Several persons have attempted the task, and have given estimates, on the basis of cost, ranging up to 30 per cent. An estimate of Mr. S. W. Abbott, Secretary of the Massachusetts State Board of Health, a few years ago, was 10 per cent. Senator Porter J. McCumber, of North Dakota, in a more recent statement in *THE INDEPENDENT*, recalls the estimate of 15 per cent. made some years ago by the then Secretary of Agriculture, based upon reports from various sources, and says:

"He made this estimate upon reports from the Food Commissioners of the several States, and from such other sources as he could command; and then to be conservative, adopted but 50 per cent. of what the total results showed. *Considering the vast amount of misbranded and adulterated goods consumed which escapes the attention of those engaged in the enforcement of law, my judgment is that the results should be doubled rather than diminished.*"

Whatever proportion of the total, on a basis of price, we take for the deceptive

food—whether 10 or 30 per cent.—we must take a considerably higher figure for the quantitative proportion. For the greater deception is in the cheaper grades. You can buy two jars of raspberry jam made of apple cores, wormholes, glucose and anilin for the same price you must pay for one jar of real jam; and you can get two quarts of "uncertified" milk for the price of one quart of the "certified" article. This quantitative relation to price, however, must not be confused with total bulk. The unadulterable cabbage or pumpkin clearly outbulks the adulterable clove; and it is probable, considering the general bulkiness of the food commodities that cannot be sophisticated or misbranded, that if all the honest food in the nation were heaped together on one side, and all the dishonest food on the other, the former would require the greater space. What the testimony seems clearly to show is that in all the categories of food wherein misbranding and "doctoring" are possible, the amount of deceptive goods is at least equal—or was until very recently—to that of the honest goods.

There is no space here to consider the wholesale and brazen fraudulency in the making of alcoholic drink and of the so-called proprietary medicines. But the adulteration and misbranding graft, after all, is only one of many. Short weights and measures have recently come in for exposure thru the report of the New York City Bureau of Weights and Measures. It was shown that "almost all dealers" in this city were skimping their quantities when selling goods, and the devices employed were remarkable for their number and ingenuity. The short thread graft had already been the subject of a law, passed by the Albany Legislature in 1904. "Fake" or "snide" jewelry has been for upward of ten years a source of conflict between the department store owners, who sell enormous quantities of it, and the jewelers, who are trying to stop its sale, or at least to compel the makers to stamp it for what it is. Trademark and label imitation is another widespread and lucrative graft. The "fake" instalment dealers of the East Side have had their powers curtailed somewhat by a law passed a couple of years ago; but those rapacious ex-

tortioners, the "loan sharks," despite the announcement of the District Attorney's office, in February, 1904, that they had been driven from the city, are operating as boldly as ever. The quack physicians, too, in spite of the efforts of the Charity Organization Society, and more lately of the County Medical Society, are reaping daily harvests from the credulous and unfortunate. The "fake" diploma graft flourishes as ever, and the purchasing agent graft waxes fat with increase. And the daily newspapers, in some respects the most faithful reflectors of the time, continue to graft upon their readers by means of "fake" reports, "fake" telegrams, "fake" cablegrams, "fake" pictures, advertisements of "fakes" of many kinds, and finally by "fake" editions.

As for the cablegrams appearing in New York city newspapers, it is likely that more of them are written here than abroad; and as for the editions, it is perhaps worthy of note, as indicating a general tendency, that the most enterprising of the evening papers now prints its "seventh (latest afternoon) edition" at 9.40 in the morning. Most American newspapers, moreover, both daily and weekly, religious as well as secular, which print advertisements of proprietary medicines, are now known to be parties to contracts which tend to compel them, and usually do compel them, to support the interests of the patent medicine grafters against legislation in behalf of the community.

These are but hints at the range and volume of commercial graft. But then nothing more than imperfect mention can be given in the space here allotted. Graft permeates the entire range of commercial occupation. Not all men graft, by all means; but men in all classes of competitive occupations do graft. And except for the limits put upon the spread of this evil by the intervention of the State, it tends always to increase. The struggle for a livelihood grows fiercer, and he that would compete with his fellows must play the game as it is played. However scrupulous he may wish to be, he must meet, in greater or less degree, if he is engaged in a competitive occupation, the devices of the less scrupulous. Only the fittest survive, and they are

fittest who can best use the weapons of their time.

The reiterated exhortation to men to be good and not to graft is of itself, under the circumstances, a sort of graft. It is a barren counsel of perfection, given by those who earn their livings by uttering it—by ministers, teachers and various other sorts of publicists—and it serves only to blind men's eyes to the real facts of life. Nature lays upon us the necessity of making a living, and prompts us with the impulse to action. By the system of production and distribution which we ordain or accept, we set the terms of the struggle. Under the individualist, competitive mode of production, each man must seek a material advantage over his fellow. The character of that advantage cannot be moralized by appeals to the conscience of the individual. Conscience, tho a composite of many shadowy forces and influences, is predominantly a reflex of material necessities; and what the individual must do in the struggle carries with it, to him, its own sanction. Abstractly he may know graft to be wrong; and he may fervently wish that all indirection of speech and conduct might be abolished by an individual growth in morality, by a spontaneous common consent, or even by statute; but in the needs of his daily life, as a participant in the struggle, he feels that the particular graft of which he is the beneficiary is justified. Life is dear; and to take from him the means by which he lives is to take life itself. The necessary means for maintaining life are inescapably sanctioned to his conscience.

The incentive of graft is thus the individualist, competitive mode of production and distribution. Men graft because they have to, or perish; and having to, they must needs feel that grafting is right. By no appeal to the conscience of the individual can grafting be eliminated. It can be eliminated only by a revolutionary change in the mode by which we make and distribute goods. The particular and competing interests of mankind must be merged in a common interest; and society, in its organized form, must take over to itself the production of commodities, making them not for sale, but for use, and distributing them to the users without individual profit.

# The Difference Between Japan and the United States

J. H. DE FOREST, D.D.

MISSIONARY OF THE AMERICAN BOARD AT SENDAI, JAPAN.

TO begin with the far distant past, Japan was made by heat and the United States by cold. Long before the terrible volcanic activity that built up, and tore down, and uplifted, and submerged, and finally lifted again the chain of islands now called Japan, the United States had appeared in low ridges of granite, and gradually assumed its continental form with a solidity that could bear, over vast areas, accumulations of ice and snow thousands of feet thick, that sluggishly flowed south, planing off tops of mountains, digging out valleys, and piling up miles of mud and stones here and there, making at the

same time a deep, rich soil for the joy of future farmers. The cold had the upper hand in the final shaping of the larger part of our North America. The heat that made Japan the most beautiful island empire of the world still lingers underneath, making its power felt occasionally in a playful blow-off in an hour or two of the upper thousand feet of a lofty mountain, or in a magnificent shoot of black curling smoke rising 10,000 feet over the crater of a living volcano.

Standing recently on one of the rolling ridges of New England, where a lovely lake was in full view, the question jumped into my mind, Why does the

Mt. Shirane, 7,500 Feet Above Sea Level, as Seen from Kusatsu Hot Springs. Taken from upper piazza of Ichii Hotel. Sulfurous waters are boiling up in the left of the enclosure, and running off in troughs in which sulfur is deposited. The central building is the public bath house for men. Hot water boils up wherever a hole is dug, so that the hotels have private baths.

Section of Wild and Ragged Lava Bed 112 Years Old. This eruption destroyed several farming villages and buried large tracts of land. This steam-charged bed exploded into these ragged blocks, thus making a bed wholly different from those of Hawaii.

beauty of our New England lakes differ so radically from that of Japan's lakes? At once it flashed across me that the beauty of New England scenery is a glacial beauty, that of Japan a volcanic beauty. Both are indescribably beautiful—these two types that are the dominating factors in the landscapes and waterscapes of all continents and islands.

The lakes of Japan are of volcanic origin and are high up in extinct craters. While a crater lake is in the making, beauty is impossible. A crater that is just cool enough to allow a lake of hot water in its basin is about as repulsive a place as one ever sees in nature. For the peak has had no time to cover its dirty mouth and sides with vegetation. It is at best a mass of desolation; one look at which is enough. But when the once destructive crater has had its rotten walls rounded off by fierce storms and freezing winters, and the irregular sloping sides, all covered with bamboo grass and groves and spruces, are cut here and there with little valleys at the foot of which lies a deep blue lake, sometimes miles in extent, then you have one form

of volcanic beauty worth going far to see.

The lakes of New England, New York and the northern regions, where the glaciers did their slow grinding work, are mainly low down near the ocean level, and tend to run north and south. Those long, narrow lakes of Central New York show how it was done. But all sorts of shapes are in evidence, where the moraines were left zigzagging, and hard granite peaks refused to get out of the glacier's way. The giant stream had no reason for economy in lake-making. When it melted it covered large areas with thousands of lakes and lakelets. There are 1,300 in the little Adirondack corner, with mountains looking down upon them and forests encircling them. Wisconsin and Minnesota contain countless lakes and ponds, all children of glaciers. Japan can boast of nothing comparable with this in point of numbers; and, of course, since Japan does not average 100 miles across it, and is shaped much like a long roof, there is no place for large lakes or groups of smaller ones. It would be hard for a professor of geol-

A Lake in the Making. The farther lake is slowly boiling and is deeply blue. The nearer one is coolish and almost blood red. Five thousand years hence it promises to be a beautiful bit of scenery, but now it is a disgusting mud hole away up in the sky.

ogy or of geography to mention fifty lakes in Japan. The standard "Guide Book for Japan" mentions only fifteen.

Among the famous ones that charm everybody are Chuzenji, just above Nikko, from one end of which leaps out thru the overhanging trees the Kegon waterfall, with a plunge of 250 feet; the Hakone lake, 1 mile by 4, 2,400 feet high, famous most of all because Fuji looms up above the retreating walls that formed the old crater; little Haruna, bewitchingly beautiful, 3,000 feet up. Inawashiro lake, 12 miles by 12 and 2,000 feet high, is the largest in the empire, but it is known chiefly on account of its nearness to Mt. Bandai, whose bad behavior sixteen years ago astonished the world, for it blew off its top of a thousand feet within two hours, and thus dammed up the near mountain valley, making Lake Hibara, 8 miles by 1, which lies 4,000 feet above sea level.

There is one lake, however, that must not be slighted, so large that all the crater lakes of the empire might be put into it. It is justly called a lake, and yet it originally was only a part of the Inland Sea, and when that part of Japan was gradually elevated this body of wa-

ter was caught in the uplift and became Lake Biwa, famed for its eight exceptional views. It is about 300 feet above the sea and is thirty-six miles by twelve. It is the one lake of Japan whose bed was not made by fire. There are also many shallow lagoons, some of which are miles in extent, but they were until recently ocean inlets, and are not classed as lakes by the Japanese. There are over twenty of them in this Miyagi Province, all of them but a few feet above the sea. The real lakes of Japan, those that make her famous, are the children of fire, just as our New England beauties are children of ice. With all our vast territory, twenty times that of Japan, we boast of only one crater lake of importance, and so our geologists rightly recognize its unique place by calling it the Crater Lake—of Oregon.

The fire of Japan and the ice of America have left their mark on some of the customs of the two peoples. Japanese love to bathe in the hottest possible water, and Americans love to drink the coldest possible water. Both lands abound in springs, Japan's being hot, while America's are cold. If Japan has few lakes, she has a splendid monopoly

of 1,000 hot springs. Suppose New York, which is one-third as large as Japan, had 333 hot springs instead of her numerous cold springs. The people then, instead of filling themselves with cold mineral drinks, would be washing their bodies in glorious hot baths. Invalids would gather at them for months of bathing, and cities would be built around them by the lovers of these health giving waters. And so deep would grow the love of these soft, velvety baths that visitors would carry away pounds of the sulfur, salts and iron deposits that are gathered in the troughs, and reproduce the spas in their bathtubs at home. They would abolish forever the American long bathtub, in which it is impossible to have a real bath, and put in the barrel tub, in which the bather sits in water up to his neck and soaks in heat at  $110^{\circ}$  or even  $115^{\circ}$  and does it every day.

The Japanese are said to be the cleanest people on earth, and their Chinese neighbors have the reputation of being the opposite. The simple reason is that Japan has gathered into her territory the larger part of the hot springs of the earth, and has learned the delight and value of baths that are really hot. Every home that can afford it has its bathtub heated once a day and used by every member of the family, the men first, women and children next and servants last, each washing his body before getting in. In cities, every block or two where the middle and poorer grades live has a public bath divided nowadays into two parts, one for men and the other for women, at a cost of half a cent each. To wash in one of our long, expensive tubs, in which one cannot bathe, does not give a tithe of the pleasure and profit it does to sit in a Japanese tub that with fire-flue and all costs less than five dollars. The public baths of our cities would be as delightful as

the beer saloons if volcanoes, instead of glaciers, had put the finishing touches to our continent. That is one reason why the Japanese drink hot water all the year around, while we, children of glaciers, take to ice water in astonishing quantities.

The main food of the two countries is different for the same reason. Glaciers made the soil for wheat, volcanoes made the soil for rice. The rice of Japan is the best in the world, as is seen from the fact that the United States Government recently bought a hundred tons of Japanese rice and distributed it gratuitously among Southern planters. Japan, envious of our superior wheat, has imported quantities of American seed, and tried in vain to get the American crop out of this volcanic earth.

Moreover, the diseases of the two peoples differ in one puzzling respect. The *beriberi* of India has full run of Japan, and is called here *kakké*. It is pretty well agreed that this paralytic disease comes from rice eating exclusively. We wheat eaters are wholly free from it. To prevent this painful and often fatal malady wheat is one of the medicines. The army rations are a mixture of wheat and rice in equal proportions boiled together. Nevertheless, the soldiers of their recent campaign suffered heavily from *kakké*, thousands of them having been forced to return home from this cause alone. I once saw seven hundred *kakké* patients—all returned soldiers—in a single village.

Thus the effects of the fierce fires that built up Japan are seen in her invaluable hot springs, in the charming lakes that nestle in the basins of the cinder cones, and in the food the farmers laboriously raise; while the lake covered surface of whole sections of America, our cold mineral springs, and the white bread we eat come from the less noisy work of the glaciers.

SENDAI, JAPAN.

# The Titan's Tower

BY PAUL ADAM

[The well known French novelist, M. Paul Adam, visited the United States at the moment of the St. Louis Exhibition and contributed a notable series of American letters to the *Paris Temps*, the leading French daily. These letters, rewritten and augmented, will appear in volume form this spring in Paris. The author has kindly arranged for us from his proofsheets the following interesting article.—EDITOR.]

IT is customary to sneer at those square towers, erected in every American city, on sites where the excessive price of the ground compels the contractor to recover vertically the space lost horizontally. Those who glory in their good taste affect to scorn this kind of architecture. In my opinion, they are wrong. The very height of these buildings evidently exempts them from the heaviness for which they are censured. In relation to the other dwellings around them, they are like the castle keeps of former times in the middle of thatched-roofed cottages. Now, no esthete passes an unfavorable judgment on a group formed by a tower and the little houses of a medieval city. On the contrary, every one agrees to call it picturesque. The pencils and brushes of young ladies are employed in copying its details, in the hope of thereby winning fitting praise. The same young ladies would be just as well engaged in making a water color drawing of one of these structures and the houses dipped in its shadow. There are already, in fact, certain photographs in which the operator has succeeded in catching wonderfully fine pictures. The total symmetrical proportion of the lines is very satisfying.

Besides the height, the large number of windows in the façades imparts additional lightness to this class of constructions. The pilasters of stone or brick between the open wall spaces give a certain variety to the scheme of the architect. One story will be in arches, another adorned with double colonnades, another with upper and lower entablatures, etc. This diversity of forms is supported perfectly by the altitude of the building, which does not look at all as if it was cumbrous or overweighted. The Waldorf-Astoria Hotel, in New York, has, toward the top of the roof, towers, cupolas, dormers, which greatly enhance

the beauty of its silhouette. I am inclined to believe that the Americans have discovered a new type in architecture, and that this art of theirs will, before very long, attain a high degree of excellence.

*And this art belongs to themselves exclusively!*

Even at present they have reached, or almost reached, perfection in interior construction. At Pittsburg, the Frick Building supplies the visitor with some perceptions of simple grandeur worthy of the noblest masterpieces of the classical ages. From the basement to the roof of the twenty-third story, a polished white marble, whose slabs are adjusted with scrupulous accuracy, covers floors, walls, ceilings and staircases. No superfluous ornament corrupts the purity of these surfaces. Neither molding nor groove nor line disturbs the limpidity and rigorously exact coupling of the jointures. The analysis of the grandiose proportions alone suggests the idea of ostentatious magnificence. Rising from the ground floor to the ceiling, a dark grille, with several doors, displays the lovely foliage of its ironwork. Borrowed from plant forms, the motive of these patterns is in no way inferior to those created by our modelers in metal during the Renaissance. Apparently the art of the ironworker in America is able to evolve all the suppleness and all the delicate grace invented by our foremost draftsmen in Italy, Spain and France. The best part of all this metal work is simply faultless. The same may be said of the grilles in massive copper in the central hall, which inclose the offices of the agents seated behind their enormous counters in green or yellow marble. The workmanship of these grilles is impeccable. The design of the fretwork which runs along the entablature is an achievement of rare harmony. In this immense white hall a

score of offices stand thus, side by side, in magnificent propinquity—an example of luxury which the Roman Empire would have wished for in vain. The idea of their number enlarges still further the perception of this rectangular apartment, so naked and bright and polished, containing those bronze cages in which certain gentlemen, close shaven like the ancient Romans, and clad in gray, are writing on registers, inspecting bundles of documents, manipulating the keyboards of the writing machines, while the wings of the electric ventilators turn and rumble.

In the center of the square formed by the rows of these offices rises an iron house, standing apart, isolated. Two steel doors, round as the cap of a watch, open into the two extremes of this edifice, also protected by grilles. It contains mahogany tables, the desks on which are masked on three sides by opaque plate-glass, in order that the money changers may count their money undisturbed by curious eyes. This is the cash office. A thousand little closets line the inside walls. They guard the funds. Each of them has set upon its bronze door a cipher in copper, the Arabesque caligraphy of which is treated with matchless taste. These numbers are masterpieces of modeling. Altho all different, they all seem, at a short distance, identical, like a design repeated in sober tapestry. Here again the charm is dependent on the harmony of the simple forms and on the prescient ingenuity and discretion with which their proportions have been treated.

In all the offices the seriousness of the well-groomed clerks is very noticeable. but that of the women is even more intense. These spectacled eyes never turn aside for a second from the shorthand notes which they are translating on their alphabetic apparatus. Blonde heads, black heads, gray heads, direct all their attention to the task which is being accomplished. There is no *ennui*, no lassitude to be read on these colorless and immaculately clean faces, but a fervent resoluteness to execute a due task heartily and loyally, to take a pride in having their part in bringing about the triumph of the national industries, the patrimony of the entire democracy.

These offices are superimposed upon one another up to the roof, and are all identical. Flood of visitors, clerks, telegraph messengers, errand boys, ascend and descend in dozens behind the artistically fashioned grilles of the elevators. They are dumb, they think of nothing but the end of their course. They never chatter, they never smile, they never jest. All they do is to elbow one another in silence, when rushing out of the cage, so that they may reach their destination at the earliest possible moment, get thru with it at the earliest possible moment, perform the greatest possible amount of labor in the smallest possible time. Either they are conscious of this impetuosity of theirs and of what their hurry is going to win for them, or else they hurry on unconsciously, because every one around them is hurrying on, because the hurry of the crowd magnetizes their nervous system and sweeps them away in its fatal movement. No one knows. They do not know, perhaps, either, unless it may be that the extreme pride of this people animates the individual in small things as well as in great; unless, that, enslaved by this public sentiment, and well nigh seeing that the Union is almost the first to reach the historic stadium of the nations, he wishes to safeguard that glory by being the first to reach the end of the corridor.

From another point of view, the whole strength of America is combined in the twenty-three stories of this building. Managers of affairs come there to think; inventors and financiers come there to associate; there the banks buy, sell, discount, unite, look after the elections, project social laws, plan railways, stir up the appetites of the masses, satisfy them, exploit them, order mines to be dug, the desert to be plowed, bridges to be laid, docks to be built, cities to be founded, petroleum wells to be captured, the cotton of the South, the wheat of the West, the metals of the East, the leathers of the North to be cornered, an advance or a decline of a few cents in values, which means millions of dollars for some people, in view of the magnitude of the natural riches at stake, supplied by the immensity of the territory, the variety of its products, the fertility of the virgin soil, the efforts of eighty millions of in-

habitants, the prosperity of a commerce which immigration alone endows, each year with 500,000 new clients.

Consequently, in all the important cities, the quadrangular towers of the skyscrapers are erected in the business quarters, near rivers thronged with steamers, within hearing of the goods trains, the tocsins of which are ever sounding. The tower of which we have been speaking is the tower of the Titans. Its flat roof overhangs space. In his bright, large office, superbly furnished in the simplest fashion, Mr. Frick watches the panorama of his giant work, the Steel Trust, organized with Messrs. Schwab and Carnegie, but in accordance with his inspirations. For this man, who is full of life, and who bears a likeness to King Edward VII., it must be no slight satisfaction to contemplate, thru the windows of his big office, the entire nature of this country being transformed in accordance with the needs of enterprise. He feels that it is his intelligence that reigns. He knows that, in this bright tower of marble, his brain work, and, above all, his example, stimulates the courage of those thousands of earnest people who are swept by the magic flight of the elevators up to the roof or down to the basement.

In order that this strenuous labor may be interrupted as little as may be by the necessities of life, the sub-basement of the Frick Building contains a pleasant restaurant, pleasantly served. There may be seen the heroes of Wagner in decorative frescoes framed by curve patterns of native wood. A bar dispenses its creature comforts to those economical customers who are content with cold meats and beer. Not far away, in another apartment, the barbers are shaving their patrons, stretched horizontally in a mechanical armchair. The white-vested operator resembles an artificer rough-hewing a mortuary statue. Without a move, the American supports the contact of the hot napkins on the face, which is being massaged, while a manicure cuts the nails, and a crouching negro vigorously shines the projecting shoes of the patient.

Lower down still is the machinery. The different power plants are located in a series of well lighted cellars. They engender the electricity spread thru the

entire structure; they produce the cold of the glaciers; they regulate the pressure of the water sent, hot or cold, into each office; they rush forward the exhaust steam which will temper the atmosphere of the different rooms; they ventilate all the stories; they distribute the force needed by the elevators. Fourteen sedate workmen watch over the dynamometers, oil the wheelworks, adjust the transmission belts, handle the levers, scrutinize the readings of the electric boards and the indicator lamps.

The Auditorium, of Chicago, is another marvelous "sky scraper." A theater, a Protestant chapel, a concert hall, and shops of various kinds, and all in the same building, complete the hotel proper. There is a tower which gives an outlook over the vast, gray expanse of Lake Michigan, over the city, where the cars of the elevated railroads follow one another thru the abysses of the streets, half the height of the house fronts, like fabulous coleopters—heavy, rapid, stubborn. Southward, the city vanishes in fogs. It has a nebulous aspect, backed against the waters on the east, like some misty mirage tinted with the gold of an indistinct sun. The printed appeals of the advertisements and their gigantic pictures appear and vanish according to the whims of the various kinds of smokes which veil the firmament. A tower was expressly constructed in order that this apotheosis might be adored at the twilight hour by travelers. In the neighboring annex of this hostelry there is a sort of hall which would lead one to believe he was in Pompeii. Thickset, polished columns support the mosaic of the ceiling, to which the changing and subdued tones of a luminous fountain, gushing from a piscina, lend color. It is a majestic apartment, filled with silence and coolness, sacred to the meditations of the robust gentlemen whose rosy cheeks and athletic limbs are reflected from the dark marble walls. Behind the journals unfolded in front of them they are—calculating. The grand hall of the hotel, Byzantine by its wide and surbased arches, its green marble pilasters and its glistening walls, will receive them about 5 o'clock. From huge globes of purple silk the electric lights irradiate these shining foreheads and careless gesticula-

tions. Confidential acquaintances take a position favorable to intercourse on the green leather divans. Those who want to talk cross their legs and lift their boots high. Bare-headed dames of austere aspect gossip beneath historic pictures lit by special lamps. At her counter the telegraphist is reckoning the words of the dispatches. Everywhere the telephones are vibrating. Those who are writing are standing at circular desks. Certain gentlemen are introducing friends, associates, collaborators to one another. Planted on their muscular legs and with the air of being impenetrable, they indulge in mutual congratulations. They display their pride in being the favored *élite*, who meet at a fixed hour in this sumptuous but public palace, for the purpose of creating opinion and combining great affairs.

It is the same at the Waldorf-Astoria, in New York, that splendid caravansary, where the daring speculators of the South and West meet to circumvent the distrust of the East. It would be impossible to exaggerate the magnificence of this spot, with its innumerable salons, the luxury of its rooms, bars and dining-rooms, the majesty of its corridors, the millions of its profits, the fabulous figures of its purchases for the appetites of its heteroclitic guests, who loll in the depths of its easy chairs, yawn in their soft hats in the smoking-rooms, and decide there on industrial combinations that will alarm all the banks in the world.

In honor of such synthetic genius, the architects have imagined these huge abodes—this Waldorf-Astoria in reddish brick, whose pinnacles tower above Fifth avenue and Thirty-sixth street, engulfing in its revolving doors of crystal the energies of men, the elegancies of women, lodging in its chambers every frantic ambition, couching in its beds of bronze every chimerical and resolute dream, washing away in its porcelain baths all the dust collected in the long Pullman car transit since starting from the balmy coasts of California, the gardens of Florida, the forests of Canada and the gorges of the Rocky Mountains.

In these hotels the union of the States is accomplished around a table laden with all their fruits, with all their venisons, with all their choicest products. They are the temples of a perpetual communion between these *déracinés*, who testify to American strength and American supremacy among other nations, whatever our theorizers may choose to think of the rooting (*enracinement*) of a nation within its own borders, theorizers who are contradicted by the most manifest experience of the nineteenth century.

On every side these buildings have sprung up from the soil in spite of difficulties. In New York it is necessary to dig to a great depth, to penetrate thru layers of earth and reach to the solid rock, in order to insure the foundations of these Babels. A long and costly labor. Afterward, the workmen adjust the rails and columns of an iron cage, which rises to the sky in a strange and colossal fashion. Then they fill up the void spaces in the design with brick or stone. The architects like to cement, on the layers of stones, blocks of rather dark sandstone, quarried by blasting in a barbarous way, so that the erection bears some sort of resemblance to a Pelasgian wall.

These wonderful artists do everything in their power to endow their constructions with the power of suggestion. They have well understood that this should be the principal aim of their efforts. To have raised these donjons to a height of 25 feet in order to superimpose one commercial office on top of another, in order to plant high aloft above the cities the standard of the omnipotence of Money, as of yore the feudal tower soared aloft above the surrounding plains—what accurate and happy symbolism!

Up to the present moment our ignorance has been fond of sustaining the thesis that the Yankees possessed no personal art. We have the refutation of this falsehood before us. The art of great buildings marks the beginning of an incomparable architecture, worthy of the eulogies that have been lavished on all the ancient styles.

PARIS, FRANCE.

# The Olympic Games of 1906

BY WILLIAM N. BATES

DIRECTOR OF THE AMERICAN SCHOOL AT ATHENS.

THE Olympic Games of 1906 are now a thing of the past, and the committee in charge of them and the Greek people generally can congratulate themselves that they have been quite as successful as the famous Games of 1896. Then they were a revival, with all the element of novelty to arouse the spectator; now they have become a well established tradition, and yet the interest in them has increased rather than diminished. Any one who has not lived among the Greeks will find it hard to understand how deeply interested they are in these sports and how seriously

they take them. The average man feels that in these games he is being brought into direct competition with the great nations of the world in a field in which he ought to excel, and he is determined to do his best. This feeling pervades the whole Greek world, and so, as the program showed, there were among the entries Greeks from Egypt, Cyprus, Crete, Constantinople, Smyrna and Salonica, as well as from every part of Hellas.

The visit of the King and Queen of England just before the Games did much to add to the gaiety of Athens. The streets were decked out in their honor

The Royal Party Entering the Stadium.

Start of the 800 Meter Race.

with flags and banners, which gave a decidedly holiday appearance to the town, and the entertaining done by the Court was quite in keeping with the holiday spirit of the people.

The contests consisted not merely of the events usual in our track meets, but, in addition, there were wrestling bouts, throwing the javelin, fencing, shooting at clay pigeons, described by the Athenian newspapers as "shooting with hunting weapons at small mud disks," gymnastic exercises, boat races, swimming races, bicycle races and a lawn tennis tournament. An attempt was also made to revive the ancient pentathlon, a sort of all round competition, with the following events: Running 192 metres, standing broad jump, throwing the discus in the Greek style, throwing the javelin and wrestling. In the discus throw there were two contests. In one the athlete might throw it as he wished, but in the other he must assume the pose of My-

ron's famous statue. The track events, except the Marathon race, were held in the Stadium; most of the other contests at Phaleron.

The Games opened on the 22d of April, with all the splendor which the most ardent admirer of athletic sports could desire. The great white marble Stadium, larger by far than any similar building in the world, was filled with spectators long before the time for beginning, altho the only events advertised for that afternoon were in the nature of gymnastic exhibitions. On the hill of Ardetus, overlooking the Stadium, were crowded together thousands of spectators, and near the entrance were thousands more who were unable to obtain tickets. Shortly after 3 o'clock the royal party entered. King George led the way with Queen Alexandra of England. Then came King Edward and Queen Olga, the Prince and Princess of Wales, the Crown Prince and Princess of

The Swedish Gymnastic Team Entering the Stadium.

Greece, Grand Duke Boris of Russia and the other Greek princes and their English cousins who were then visiting Athens. King George seated King Edward on one of the two thrones and took the seat at his right. Then the athletes marched in by nations in alphabetical order. The most conspicuous among them were the Cretans in their picturesque national costume, consisting of a sleeveless embroidered blue jacket, baggy blue trousers with high boots and a soft crimson cap with blue tassel. The committee wanted them to put on European dress, and told them they would be laughed at, but they declared that they would not enter if they could not wear their native costume. The Crown Prince Constantine, as President, read a short speech, and King George declared the games formally opened.

A Greek team was first to compete and went thru various drill movements with much precision. They were followed by a team of young women from Denmark, whom King George had honored with

a room at the Palace. These young women made something of a sensation, they went thru their various movements well, even if they did not win a prize. Swedes, Danes and Germans followed, each having some exercise distinct from those of the teams which had preceded, and at seven o'clock the games were over for the day. The spectator's interest during the afternoon was attracted not so much by the competing teams as by the Stadium itself. As the royal party walked down the middle of the field the scene was most impressive. The seats rising on each side with thousands of gaily dressed spectators might be compared with the scene at a Harvard-Yale baseball game multiplied tenfold. On the parapets above the seats and above the passage half way up regiments of soldiers were seated side by side, and high above all, at intervals of about thirty feet, floated the flags of all nations, the Greek, English and American being in the most conspicuous places.

The athletic events really began on the

fourth day, when the trial heats in the 100 meters race began. Here the American athletes had everything their own way, beating all others easily. This is the way the morning *Acropolis* describes the defeat of Barker, the Australian:

"The great champion, Barker, who had beaten the still greater champion of the world in the contest of 100 metres, the remarkable Taffy (would Mr. Duffy recognize his name?), was beaten by the terrible Robertson, the American, coming in second only a breast behind."

But this was only the beginning, and in the finals of this event, two days later, the American runners maintained their prestige, Hahn and Moulton winning first and second places, and Barker third. Schick, the intercollegiate champion, ran in the preliminaries, but lack of condition kept him from adding to the American victories. The five mile race was also run on this day, and was the only race won by the English team. Hawtreys easily came in first in 26 m. and 11 s., with the two Swedes in second and third places.

But the event which aroused the greatest enthusiasm among the spectators was

the weight lifting contest. This is hardly a sport to enthuse over, but 40,000 Greeks turned out to see their champion win, and he did win, while the crowd shouted and applauded. The victor was a private soldier from Patras named Tophilos. In the evening he was put into a carriage, together with his mother, and dragged about the streets, accompanied by a brass band. The next day another Greek, Georgantas, won in throwing the stone, defeating the American, Sheridan, who came in second. He, too, was heartily cheered, and when he came back into the Stadium as spectator, Greeks of all degrees were glad to shake hands with him, and one man kissed him on both cheeks and dropped a gold chain into his hand.

The event which was looked forward to with most anticipation by Greek scholars in Athens was the production of the "*Edipus Tyrannus*" of Sophocles in the midst of the games. It is typical of the modern Greek spirit that no great celebration could be complete without the production of at least one of these ancient masterpieces. The play was

The Swedish Gymnasts Drilling in the Stadium.

Pole Vaulting in the Stadium.

given in the semi-circular end of the Stadium in accordance with Dörpfeld's theory—that is, without any stage. A temporary structure with three doors representing a palace served as a background. Unfortunately no attempt was made to solve the difficult problem of the dances, and the members of the chorus simply stood together and sang the choral songs. Furthermore, in order to produce a sufficient volume of sound, for the acoustic properties of the Stadium are bad, the chorus was made to consist of about thirty-five persons. The acting on the whole was fairly good, altho the performance could not in any sense be called Sophoclean. Counting the spectators on the hill, probably 10,000 persons saw the play. After the games were over the "Electra" of Sophocles, which had been played in one of the theaters, was also brought out in the Stadium.

The day after the "Œdipus" the best race of all took place, the finals in the 400 meters race. There were eight starters, four Americans, two Englishmen, an Australian, and a Frenchman. One of the Americans took the lead, closely followed by two of his team mates, and then the Australian, Barker, and the others. About half way around Barker sprinted into the lead, which he held until within about thirty yards of the finish, when the American, Pilgrim, and the Englishman, Halswell, passed him, coming in first and second.

The interest manifested by the Greeks on the first days of the games did not abate as they approached their end. Day after day 50,000 people filled the Stadium and covered the hill Ardetus above it. When the day of the Marathon race arrived, not merely were all the seats taken, but every foot of the balustrades in front of the seats, both above and below; and even the top of the wall high above the other spectators was lined with men. Besides this Ardetus and the high land to the south of the Stadium was closely packed with an enormous crowd. Even then there were thousands who could not see the finish of the race, and they lined Herodes Atticus street and Cephisia Road on both sides for five miles or more, eager to welcome the winner as he approached the Stadium.

It is hard for the foreigner to under-

stand how intense the feeling of the Greeks was about this race. They seemed to think that the reputation of their country was at stake and that as a matter of national pride they must win it. For days before the race groups of men could be found almost anywhere discussing the probable outcome. Many Greek runners had been in training for it, and when their national games were held, early in April, seventy-five men entered for the Marathon race and thirty-two actually finished. Of these the first fifteen came within ten minutes of the winner, and the time, in spite of rain, was only about six minutes behind the record. It was not surprising, therefore, that thirty-three Greeks entered for the Marathon race in the Olympic games. At the last moment a young deacon, who said he could make the distance in two hours, came forward and wished to run. The Metropolitan, thinking this undignified, declined to let him; but he declared he would run in his canonical robes, and actually went out to Marathon and lined up for the start. The committee, however, would not accept his entry, and the Stadium was thus deprived of the chance of seeing a Marathon runner enter in priestly garments.

The race was started at three o'clock, and while the runners were toiling over the hot and dusty road other events were being decided in the Stadium. First came the finals in the 800 meters race, the half mile, in which the American runners, Pilgrim and Lightbody, finished just ahead of Halswell of England. Then the hurdles followed, won by Leavitt, after a close race, from Healey of England, and Dunker, a German. Just before the hurdles three bicycle riders entered the Stadium covered with dust and almost side by side. They had ridden to Marathon and back in the 84 kilometers race. All three were Frenchmen. Meantime, the standing high jump and the discus throw in the Greek style had been going on while the excitement of the spectators was visibly increasing; and when these events were over the crowd sat in silent anticipation of the entrance of the Marathon runner. At last he came running down the Stadium, with big Prince George of Crete running beside him. The crowd applauded, altho his

nationality was not yet known, but in a moment he was seen to be the Canadian Sherring. He crossed the finish line, bowed to the King, and walked over to the exit, apparently fresh enough to run several miles more. His time was 2 h. 54 m. 23.3-5 s., an improvement upon the 2 h. 56 m. made by Loues in the Marathon race ten years ago. It was a bitter disappointment to the Greeks, but they applauded and waited patiently for the

win; but the next morning this was gone and the people were determined to regard their defeat as a lesson to be profited by.

The victory of Sherring was perfectly logical and well deserved. He came to Athens about two months before the games, studied the course carefully and ran the race in a scientific manner. A victory was the natural result. He is said to have stopped twenty times during

Finish of the Marathon Race. Showing Sherring, the Winner, Bowing to the King.

second runner, who came in almost seven minutes later, and proved to be the Swede Svanberg. Five and a half minutes later came the American Franc. Still the crowd waited, as one after another the runners came in. The first Greek to arrive came fifth. Then they collected about Loues and talked about the race of ten years ago. There was the same feeling of depression in Athens that night that one sees in an American college when some athletic team has lost an important game which it was expected to

the race and to have walked up all the hills. Franc, the American, ran the whole distance without stopping.

On the 2nd of May the prizes for all the contests were awarded in the Stadium. After the royal party had entered, about 1,800 schoolboys from Athens and the Piræus, all in uniform, marched into the enclosure and after a few drill movements took their stand as spectators. The winners were called up one by one and received their prizes from the King. A branch of bay was given to every vic-

tor and in addition a medal and usually a cup or some work of art. The Marathon runner received the finest prize, a marble statue of Athena half life size. After the prizes were awarded the royal party withdrew and the great audience, as usual with Greek crowds, slowly and in an orderly manner made its way out of the Stadium.

It is doubtful if in any other country so much interest could be taken in these games. The average attendance in the

Stadium must have been about 50,000, only an insignificant fraction of which consisted of foreigners. The fact is that the Greeks have come to regard these games as a national institution, and even now they are looking forward to the next meeting to atone for their present defeats. Of all the athletes the Americans did the best, winning six out of eight races, three out of six jumps and two of the four weight events. The appended table shows the winners:

| EVENT                     | WINNER     | NATIONALITY | TIME OR DISTANCE  | SECOND            |
|---------------------------|------------|-------------|-------------------|-------------------|
| 100 meters.....           | Hahn       | American    | 11 1-5s.          | Moulton, Am.      |
| 110 meters, hurdle.....   | Leavitt    | American    | 16 1-5s.          | Healey, Eng.      |
| 400 meters.....           | Pilgrim    | American    | 53 1-5s.          | Halswell, Eng.    |
| 800 meters.....           | Pilgrim    | American    | 2m. 1 1/2s.       | Lightbody, Am.    |
| 1,500 meters.....         | Lightbody  | American    | 4m. 12s.          | MacGough, Eng.    |
| 5 miles .....             | Hawtrej    | English     | 26m. 11s.         | Svanberg, Swede   |
| Marathon race (42 kil.).. | Sherring   | Canadian    | 2h. 51m. 23 3-5s. | Svanberg, Swede   |
| 1,500 meters, walk.....   | Bonhag     | American    | 7m. 12 3-5s.      | Donald, Canadian  |
| Standing broad jump....   | Ewry       | American    | 3m. 30cm.         | Sheridan, Am.     |
| Running broad jump....    | Prinstein  | American    | 7m. 20cm.         | O'Connor, Eng.    |
| Standing high jump.....   | Ewry       | American    | 1m. 56cm.         | Léon, Belgian     |
| Running high jump.....    | Leahy      | English     | 1m. 77 1/2cm.     | Sheridan, Am.     |
| Hop, step and jump.....   | O'Connor   | English     | 14m. 7cm.         | Robertson, Am.    |
| Pole vault .....          | Gouder     | French      | 3m. 50cm.         | Goency, Hungarian |
| Throwing stone .....      | Georgantas | Greek       | 19m. 92 1/2cm.    | Leahy, Eng.       |

## A Hymn of the Pilgrim Church

BY ALLEN EASTMAN CROSS

[Three denominations, the Congregationalists, the United Brethren, and the Methodist Protestants, are now moving toward organic union. For this the name of the Pilgrim Church has been suggested by a minister of the United Brethren, as one significant and beloved. The accompanying lines may be sung as a hymn to the tune of "Denver," as found in "In Excelsis."—EDITOR.]

THEY hailed the pillars of the Lord,  
They dared the desert sand—  
The fire, the scaffold, and the sword—  
They knelt upon the strand.

From Abraham to Robinson  
Pilgrims of God were they;  
From earth to heaven they journeyed on—  
They camp with God alway!

One Lord, one Faith, one holy sign  
For those strong souls sufficed;  
And Brethren all, like Otterbein,  
They kept the prayer of Christ.

Then not in sorrow, nor in gloom,  
Repeat the ancient word;  
It speaks of men that dared the doom  
As martyrs of the Lord.

It tells of hero and of saint  
That greet us from afar,  
To whom the sky was but a tent,  
The earth a fading star.

Pilgrims of morning, not of night,  
By dark or death unawed,  
Bequeath to us this word of light,  
O Pilgrim Church of God!

BOSTON, MASS.

### Father Rudolf Meyer

The death of Father Louis Martin, General of the Jesuits, is not only an event of great importance in the Catholic Church, but especially to Americans, for his successor will be a priest who has literally risen from the masses. The next Black Pope, as the head of the Jesuit order is termed, is Father Rudolf Meyer, who at present occupies the position of General over the members of the order in the portions of the world where English is spoken. Father Meyer's career is typically American. The son of a German farmer, he was born in St. Louis, receiving his education, as a child, in one of the parochial schools of that city. His parents decided to give him a higher education, and, when twelve years of age, he was sent to a Jesuit college, where he determined to join this order, spending the six years of his novitiate in his native State and in Maryland.

As a student, Father Meyer's intellectual attainments were so pronounced that he made a notable record in his studies, and after taking orders he was assigned as an instructor in one of the American Jesuit colleges, later serving as president of the famous College of St. Francis Xavier, of St. Louis, also of Marquette College, of Milwaukee, and finally of the University of St. Louis, where he received his final education.

Since 1892 the next Black Pope has acted as Assistant General of the order, being elected to this position by the General Congregation of the Society of Jesus at its convocation in Spain. During Father Martin's last illness, Father Meyer assumed many duties of his office, and since his death has been acting as General of the Society.

Father Meyer is 65 years of age, but appears much younger on account of his vigorous health. He is of an attractive personality and is considered one of the best informed scholars of the Catholic Church, being an authority upon its theology. He will be the first American to become General of the Society of Jesus, which, as is well known, has the world for its field of operation, being distributed in thirty-five provinces, embracing nearly every country on the globe.

# The Walking Delegate Novelist

MRS. L. H. HARRIS

THE walking delegate novelist is the literary offspring of the labor unions and the slums. That accounts for his disposition. He is a fanatical cross between the sentimentalist and the revolutionist. This makes him a Socialist. Not a reasonable scientific Socialist, but the dark-lantern kind, who burglars his material from the capitalists and trusts, then gives it an emotional glare upon the pages of his book. Doubtless, he has had his share in the discovery of that new remorse in us which is called "the social compunction," for he does not write of the poor in the conventional picturesque style of fashionable novelists, which casts a poetic glamour over poverty and ignorance—Owen Kildare just misses being a walking delegate of fiction at this point. He is a sort of stunted poet sitting somewhere upon the fire escape of an old Bowery tenement, piping the best he knows how of his dear "little party," and exciting admiration rather than compassion for the people of that district—but our walking delegate artist of life presents every type of miserable, bat-winged humanity, not as vagrants and criminals, but as men and brethren who have as many rights and wrongs as other people. He leaves statistics for the census report and shows their haggard profiles in mournful procession thru the agonies of his tale. He represents the abuse to be corrected in terms of human life. It ceases then to be a matter of police records or of indifferent ignorance, but it is a vision and a voice which we cannot neglect without doing violence to our own well-fed respectability.

And the danger is not that they will lack sufficient influence upon the dark current of affairs which they portray, but that they will have too much. A novelist is not designed by his peculiar gifts either as a leader or a reformer, least of all the walking delegate kind. He is simply the excited photographer of conditions, an agitator, a voice crying in the wilderness. But it is never safe to follow

him in real life to his enthusiastic conclusions. They always belong too far in the future, not to say in the imagination. "Uncle Tom's Cabin" is an illustration to the point. This was a very good book, and a mild one, considering the material from which the author had to choose. And it stimulated a worthy compassion for a very unfortunate class of beings, but it also sowed seeds of bitterness between the blood brothers of the North and the South, which have matured since into antagonisms that are well nigh implacable. And this is the regrettable feature of modern walking delegate fiction. Whatever success these writers win for the cause of the poor they are the knight errants who will establish a lasting hatred between the masses and the classes, because they are not really romancers, but they are the fierce scripture writers of the poor, and they are giving a permanent form to the oppression of the rich and to the wrongs of the poor.

Still, we must not confuse them with the neurotic novelists. The latter are usually women. When a man, like Anthony Hope, writes of the bad in people he does not get nervous over it, and his heroes and heroines do not. They are simply cocktail elements in the social world, to be taken gaily and without the embarrassment of conscientious reflection. But women, even as writers, have no real courage for wickedness. And they become emotional when dealing, as Edith Wharton does, with the polite evils of respectable society. They are the same evils, of course, which the walking delegate novelist records in stories of his sad, sloven, besotted humanity—only the men in Miss Wharton's novels do not lose their jobs when they steal and get drunk; they go on becoming greater and greater factors on the Stock Exchange. And the women who are seduced do not become drabs; they continue to reign as the most fascinating belles of their peculiar set. No one expects to reform such people, least of all the lady novelists who betray

them. Their stories are simply the literary neurosis of a sort of moral despair, the kind where everybody is bad and where they merely wish that they were good. Everybody is bad in the walking delegate's novel, too; worse than bad; they are not even respectable. But the point he makes is that they have a simple, sincere longing for higher forms of life and a savage instinct for virtue to match. And the everlasting difference between him and the neurotic novelist is that he exercises all his shocking gifts as a writer to create favorable conditions for their advancement in the scale of things. He is constructive as well as iconoclastic. He would destroy only half the world, the rich and powerful, in order to give his heroes and heroines in the bottomless pit of poverty and crime a chance to show better virtues.

So much for the walking delegate novelists in general. There are grades among them, of course, "skilled" and "unskilled" dramatists, so to speak. And we know that Dickens was probably the forefather of them all; but of late years, and in this country, Frank Norris was the most promising writer of this class. And no other has yet surpassed him in the power to dramatize the fact that it is possible to form a great corporation that has the will and the strength to crush competition and destroy the individuality and hope of large numbers of men who are the inevitable victims. The awful impersonality of these relentless systems took hold upon his imagination. The pity he showed, the protest he made, was an implied appeal for the redistribution of forces in society. And while it was the fashion among literary critics to write of "The Octopus" in a jocular vein, as the crude effort of a young man who had more convictions than judgment, the fact remains that he was the first American novelist to symbolize, with any degree of power, that future which the Socialists foretell when he allowed the wheat speculator, who had impoverished a whole district by his financial villainies, to be buried alive in the grain he had bought. It was a crudely expressed prophecy, to be sure, but there was an epic simplicity about it which makes it last in the memory.

Properly speaking, Jack London is a

"hobo" novelist. This is not so bad as it sounds, nor nearly so bad as it used to be. Some very distinguished men among us have been hobos of late years. It is a sporadic way they have of developing the cosmic consciousness of humanity. Formerly a man was content to be a respectable member of society; now he may wish to know how it feels to be a tramp also. Some think Mr. London has made more explorations than were necessary to fit him for his vocation of preaching the gospel of the poor. He has been "a salmon fisher, an oyster pirate, a longshoreman, a sailor, a tramp; been sent to jail, lived in the White-chapel slums, and been to the Klondike in search of gold. All these things he pictured in his books, and because he was a man of genius he forced the world to hear him," says an admiring fellow delegate. Yes, of course—one could hardly have lived in the world at all during the last few years without hearing Jack London. There were times when he was disposed to make himself the bass-drum of the whole business. But the question is whether the fact that a man is a "genius" entitles him to make so much noise. It is increasingly difficult to be born in this country at all without being a genius of some kind. We are very unhealthy in this particular. The important thing is not whether Mr. London is a genius, then, but whether he has the safe point of view for a "gospel" maker. The kind of elk-nature he has and mental obstreperousness he shows are not altogether desirable morally in their effect upon others. But nothing can be done with such people. Their splendid sense of humanity, and their abounding vitality render them adorable, especially to the enemy classes which they defend. And they have a leviathan sense of liberty which does not amount to much as the dynamo of a walking delegate novelist, but it may give trouble when assimilated by the great leviathans, the slums and the labor unions. The fact is, they are not novelists at all, but unscrupulous speculators in law and life. They are not simply the sons of their own fathers, but they are often the ramping intellectual posterity of Walt Whitman and of half a dozen other erratic geniuses. This accounts for Jack Lon-

don; he is the free born son of too many dangerous forefathers. And so soon as his disciples grasp the real meaning of his biological views of law and we begin to live accordingly, we shall have more slums than ever, but we shall at least be able to name the moral malady of which he in turn has become the literary father.

And now we come to the lowest grade, but the most useful of all the walking delegate novelists. To be one of this kind requires a natural taste for what is vicious, indecent and revolting. He must have a vocabulary that settles like a swarm of flies over open cesspools and in houses filled with vermin. He must know how to create heroes, not villains, out of thieves, how to excite the reader's sympathy and admiration for a man who "shovels guts" on the "killing beds" in a meat packing house; who sleeps in his clothes and never changes them; who drinks, suffers like an animal, fights like a fiend and sinks into the lowest leprosy of sin. He must know how to portray a saturnalia of fallen women in a light which represents them as the slaughtered lambs of a monstrous social system. He must be able to describe babies with the rickets snuffling and crawling over drafty floors. He must dull pain and dishonor into sensations that are daily commonplace; show men and women who have become acclimated to all the horrors of hell so that they do not go mad at the sight of themselves, but accept their condition with sodden indifference. He must never see a flower or blade of grass, for these would be mitigating circumstances, and it is not the business of this kind of walking delegate novelist to look for mitigating circumstances. He would not confess the sky itself except to smoke it black above the heads of his beloved demon people, who are demons of necessity, the unsightly victims of great trusts and powerful corporations.

Evidently all this requires a peculiar kind of genius, and Upton Sinclair has it. He has always had it, but never until he smelled the stench of the Chicago stock-yards, saw the "killing beds," learned the horrible secret economies in disposing of diseased and tainted meat in the packing houses, saw the offal of humanity rotting in Packingtown, has he

found the right atmosphere in which to home it. And we need these buzzard geniuses to show the decayed places in the world's life, just as we need ravens above a battlefield to indicate by their horrid circlings where the unburied dead lie. A mocking bird would not answer the purpose any more than we could depend upon Mr. William Dean Howells to portray life in Packingtown. And so, squeamish as we may feel about him, we must be thankful for Upton Sinclair, as we are thankful for any other natural scavenger. It is not a raven's fault that he prefers decayed flesh; it is his nature.

Nearly all walking delegate novelists offer the same remedy for the evils they describe—that is, Socialism. And when they come to this there is a curious, admirable change in the character of their writing. They are no longer the cormorants of social uncleanness and human woes, but they become the inspired standard bearers of a great illusion. Upton Sinclair ends his story of horrors with a socialistic peroration. He writes in terms of spiritual exaltation of what socialism means and of what it will accomplish. Neither he nor any other of his class ever realizes that they are offering not a remedy, but a theory, and an untried theory, against an order of things already established. A theory may be tenable in every particular, but it is never an actual remedy until it is possible to accept it and live by it. But that is not the point. We are accustomed to think that men are degenerated by the Christian hope; as a matter of fact a man may be regenerated by the mere offer of any great hope. Sinclair is not so far wrong when he represents Jurgis reclaimed to an honorable manhood by the hope of Socialism. Thru it escaped the outcast's sense of existence, he was "converted," and became in his own mind a man once more and the brother of men. This is the fascination and strength of Socialism; it offers consolation, comradeship and great expectations to a class of people who have nothing and no hopes of anything.

I have purposely omitted Thomas Dixon from this review of walking delegate novelists because he is walking backward. He is a sort of antiquary reformer trying to stir up revolutionary sentiment toward the past. But in one sense he is

an advanced representative of the class. They all make much use of eloquence, of lurid literary effects, but Dixon has gone a step further and discovered the conveniences of the stage for visualizing his ideas. Now, the stage has always been versatile in portraying what was decadent or even shocking in current life, but the object has been to appeal for the sake of profit to what was equally vicious in the audience. Mr. Dixon does this himself, but the oppression of the poor, the selfishness of the rich, and their combined criminality is put up on the stage for the purpose of exciting sympathy and stimulating reforms, we shall have some new and startling effects in the theaters, both on the stage and in the minds of the audience. There are scenes in "The Jungle" which, if portrayed even

in a circus tent on the edge of Packingtown, would lead to some wholesome changes in the management of the "Durham Company's" packing house business. For, of course, no one could dramatize a walking delegate's novel so that it would be fit for an uptown theater. Ladies in *décolleté* gowns would faint at the sight of the "killing beds," and of the blood-smeared strikers. They could see Sarah Bernhardt play "Camille," but the quick, merciless, unapologetic way with which a meat-house boss deprives a working girl of her virtue would be revolting, because it is so nude, so inartistic . . . and, after all, the play could not be presented anywhere, for the "Durham Company" would hire the leading ward politician to hire the city council to hire the Mayor to forbid it.

NASHVILLE, TENN.

## Administrative Influence Upon Legislation

BY FREDERICK A. HENRY

JUDGE OF THE CIRCUIT COURT OF OHIO.

SENATOR BACON, of Georgia, in *THE INDEPENDENT* for March 8, 1906, discovers a violation of the Constitution, "dangerous to the maintenance of free government," in our "steady progress in the direction of the absorption of legislative power by the Executive." This may be accepted as a counterblast to the charge, so often made, of absorption of the appointive power by the Senate. But its effectiveness depends, of course, upon the validity of his premises.

That the Executive has often exercised a great, if not, indeed, a controlling influence in legislation, is true. Andrew Jackson was the first President to assert unequivocally his right to do so. And Clay then proposed that if the Executive were to provide bills ready drawn for passage, the Government should be conducted by "ukases and decrees," without the needless cost of a Congress. President Cleveland was the next conspicuous exponent of this practice. The repeal of

the Sherman Silver Purchase Act, for example, was an "Administration measure," and without his persistent and powerful aid it must have failed. Many instances of less renown might also be cited. Their recurrence seems to depend upon the temperament of the occupant of the Presidential office and the gravity of the exigencies confronting him.

But is it true that Executive interposition of this sort violates either the letter or the spirit of the Constitution? Senator Bacon emphasizes that instrument's separation of the legislative and executive powers of our Government, and examines the three apparent, or partial, exceptions to this rule, viz., the treaty-making, appointive and veto powers. He concludes that the express vesting of "all legislative powers" in the Congress excludes the President from all participation therein, and that any attempt by him to initiate or control legislation is a plain usurpation.

Senator Bacon's scholarly and spirited

analysis of the subject is entirely worthy of the constitutional lawyer that he is, except in one particular. It ignores the one provision of the Constitution that bears most vitally upon it. Section 3 of Article 2 provides that the President "shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient." This clause, while it does not indeed authorize the President to introduce bills, has yet an important bearing upon the interpretation of the respective powers and mutual relations of Congress and the President in regard to legislation. The President is not merely to point out subjects on which legislation is required, leaving to Congress the ascertainment of the precise evil and its appropriate remedy. He is to "recommend . . . measures." Why, then, should Senator Bacon complain of Presidents who propose "Administration measures"?

But it is said that an intimation as to the employment of the Executive veto has been utilized in advance to mold legislation. And here it may be remarked parenthetically that the Senators of a State, voicing by extra-constitutional "courtesy" the will of the entire Senate, have often given an advance intimation as to "the advice and consent" of that body, and have thereby molded the exercise, for their constituency, of the appointive power with which the President is, in the first instance, exclusively clothed. One is tempted to retort for the Executive to his Senatorial critics, "The villainy you teach me, gentlemen, I will execute." A better justification, however, is available. The power of recommending measures is plenary. It may be repeatedly exercised by the President upon the same subject until Congress shall have passed "such measures as he shall judge necessary and expedient." And if Congress shall pass measures not conforming to that standard, the President may return them to the House wherein they originated, "with his objections," which shall be entered "at large on their journal."

True, a question of dignity and propriety may arise if intimations as to the President's views are conveyed unoffi-

cially to Congress; but the constitutional power of the President to influence legislation by definite and detailed recommendations seems incontrovertible. Technically, of course, the Executive has no direct power to act as a part of the legislative arm of the Government, save in the exceptional case of a "pocket veto," where, by reason of the adjournment of Congress, his affirmative concurrence is necessary to the final enactment of a measure into law. But it was well known to the fathers of our country that an Executive might indirectly influence the course of legislation without direct participation therein. The Declaration of Independence complains of the King because, among other things, "he has forbidden his governors to pass laws of immediate and pressing importance, unless suspended in their operation till his assent should be obtained, and when so suspended he has utterly neglected to attend to them; . . . he has called together legislative bodies at places unusual, uncomfortable and distant from the depository of their public records, for the sole purpose of fatiguing them into compliance with his measures," etc. Yet there is no word of limitation in our Constitution forbidding the employment by the President of any of his express powers as Executive, or his influence as a citizen, in furtherance of his recommendation of measures to Congress.

As to the dangers of this practice, it is true that it is possible so to prostitute the appointive power of the Executive, "by and with the advice and consent of the Senate," as that no recompense of legislation will justify it. But that the open exercise of Executive influence upon legislation tends to a concentration of power not contemplated by the fathers and "dangerous to the maintenance of free government," is a thesis which Senator Bacon fails to maintain. Franklin observed that absolute power, if it must needs exist, is safer in the executive than in the legislative department of a government, saying:

"A single man may be afraid or ashamed of doing injustice; a body is never either the one or the other if it is strong enough. It cannot apprehend assassination, and by dividing the shame among them, it is so little apiece that no one minds it."

## Our Representatives at the Third Pan-American Conference at Rio Janeiro, July 21, 1906.

The third Pan-American Conference will be held on July 21st, 1906, and is not expected to last longer than the 1st of September. The occasion will be made notable because an American Secretary of State will then, for the first time, visit South America in his official capacity. The chairman of the American delegation is the Hon. William Inseo Buchanan, of New York, who acted as American Minister to Argentina for six years, and during that period he was designated by the Governments of Chile and Argentina as the deciding arbiter of the commission to fix the boundary between the two States. Mr. Buchanan had charge of the live stock and forestry departments of the Columbian Exposition at Chicago.

In 1901 he became Director General of the Pan-American Exposition at Buffalo. A year later he represented this country in the second Pan-American Conference, which met in the City of Mexico. Mr. Buchanan also served as the first United States Minister to the Republic of Panama.

Associated with Mr. Buchanan are Edmund J. James, president of the University of Illinois since September 1st, 1904, and sometime of the faculties of the University of Pennsylvania and the University of Chicago, and Leo S. Rowe, Professor of Political Economy at the University of Pennsylvania and president of the American Academy of Political and Social Science. Both of these gentlemen are eminent educators and will give strength to the Commission.

Hon. James S. Harlan, a son of Associate Justice Harlan, of the United States Supreme Court, has accomplished much in Spanish-speaking countries. Mr. Harlan acceptably filled the office of Attorney General of Porto Rico for two years, beginning in 1901. Señor Julio Larrinaga, another member of the American delegation, served at various times as Resident Commissioner in Congress from Porto Rico, Chief Engineer of Provincial Works, and as a member of the Porto Rico House of Delegates.

Charles Ray Dean, at present an attaché of the Department of State as chief of the Bureau of Appointments, is Secretary of the Delegation.

# Literature

## Novels of Life in the '60's

PEACE and prosperity have little to do with literature besides furnishing a market for it. The conditions which actually produce it are war, poverty, persecution or any great disaster. At present the only people in this country who sustain a sufficiently heroic relation to affairs to conceive it in any vital way are the workers, who have neither the time nor the art of expression necessary. This explains why the best books will never be written, and why the greatest epics must remain unsung. The men and women who have them in their lives and hearts are dumb. And, coming down to particulars, this also explains why stories of the Civil War are usually so inferior. The men who should have written them died upon the battlefield, and so they are written from memory by young whipper-snappers who were not there, or by that class of literary dirt-daubers who stick the stuff of their own imagination to the rafters of historical details and think that they have really written a "romance" of the war. Usually it is a cheap parody upon one of the greatest tragedies of modern times.

Cyrus Townsend Brady is almost a poster illustration of this dirt-dauber class. His last novel<sup>1</sup> is, by all odds, the best he has ever written, but that is not saying enough to recommend it. It is a story of the Civil War, with the scenes laid in Virginia. The *dramatis personæ* are Lee and his army, with the two heroines flirting beautifully on its flanks. The reader is obliged to conclude that Mr. Brady has, at last, become a "rebel" in his convictions, his sympathies are so entirely with the South. In the preface he pays a half paragraph tribute to the character, personality and genius of General Lee, and he concludes in this sing-song style:

"I did not always think thus. Born amid the roar of battle, the son of a brave Northern soldier, trained while yet the bitterness engendered during the conflict lingered in the memory, my youthful impressions gave me

quite another idea of the great Virginian, and one that was comprehended in an ugly word."

If they keep to the domestic side of it women write the best novels of the Civil War now. A volume of five short stories<sup>2</sup> is just out dealing with life in Washington City immediately after the war. As usual, the author draws too much upon the tears of her imagination; but she has done the best she could with the kind of material she selects. Meanwhile, Lucy Meacham Thruston's new novel<sup>3</sup> is really a fine piece of work. It portrays the average Southern woman, in the average Southern home, not the grand lady in her great manor house, but a poor young bride whose husband has been called to the field, left defenseless and alone with her two slaves in the wake of a hostile army. The terror she endures when she hears the roar of battle and knows that her husband is in the front ranks is well portrayed and gives some idea of what Southern women suffered in this way. Her privations, her simple hunger and physical pain are details that have been written so often that they are now commonplace to all save the white-haired old women among us who actually endured them.

There are bright corners in the world which seem to catch and hold the sunlight even when the shadows fall thick everywhere else. Sorrow comes quietly, not with the sword, and love follows so quickly after that all the graves are green and all wounds kindly healed. Mary Dillon has found such a place and laid the scene of her story in it.<sup>4</sup> She begins with the Civil War and ends as soon afterward as she can unite the North and the South in the hearts of faithful lovers. She brightens the past with a hundred memories for the young soldiers and students who were once so gay a part of that informal society along Main street in old Bellaire, and the book should find many readers to cherish it on this

<sup>2</sup> OLD WASHINGTON. By Harriet Prescott Spofford. Boston: Little, Brown & Co. \$1.50.

<sup>3</sup> CALLED TO THE FIELD. By Lucy Meacham Thruston. Boston: Little, Brown & Co. \$1.50.

<sup>1</sup> THE PATRIOTS. By Cyrus Townsend Brady. New York: Dodd, Mead & Co. \$1.50.

account. It is so rare for a modern writer of any kind of fiction to brighten the past or future with what they have to tell.

Has the gentle reader ever observed that it is always a malicious middle-aged woman or a good little boy who eavesdrops in fiction? Tom Gaston plays this innocent rôle in Mr. Naylor's new novel.<sup>5</sup> He is a nervous little boy with thin legs, who is always hearing something that was not intended for him. He cannot stop to warm his hands, but he hears two or more men plotting death and destruction to somebody. No wonder the result is a "thrilling tale." Just let any author secure the services of an alert eavesdropper and his fortune is made. In this book the scene is laid in Ohio during the early '60's, and like all novels of that place and period, it has the famous "underground rail" running thru it for the illegal transportation of slaves to the "free States." There is a scattering population of Abolitionists, horse thieves, and enough honest people to make a contrast, and between them, they do work out a delightful old-fashioned story with many midnight turns in it. And if the reader is ever in danger of being bored he is sure to learn on the next page that the little boy is hidden in the woodshed listening to Marsh Colby's plan for murdering the Kentuckian, who is the hero, and distinguished from other Southerners in Northern novels by the fact that the author has committed the sacrilege of converting him to the underground railway business!

A reader unacquainted with Western geography might infer from the after-math representations in Frederick Chamber's novel<sup>6</sup> that the late Spanish-American war was fought in Alabama. There is the inevitable "manor" house, only this time there is a chapel in one wing of it. And this in 1898! The only son goes to the front and is killed in battle. The mother becomes feeble minded, the beautiful daughter starves without losing the flush on her cheek, and they are all taken care of by an old negro who spends a fortune in gold upon them—as if it were immediately after the Civil War

and in the middle ages to boot! There never has been such a confusion of White-caps, political graft and false sentimentality. MRS. L. H. HARRIS.

## The History of All Nations

It is by no means an easy task to write a general work for the layman in historical lore. Even the problems to be solved in such an undertaking are hard to state in definite form and to visualise. What facts should be presented; what emphasis should be laid on men, institutions, literature, industrial life and purely political narrative; should one content oneself with relating the time honored stories which, according to sacred precedent, it is a reputable thing to know; and finally just what sort of person is the general reader and in a democracy what is most worth knowing—these and other questions of the same sort press upon the writer and the reviewer of popular historical works; so impalpable and changing are the standards that the man who is honest with himself and under few delusions as to the importance of his specialty will find it hard to render a "sound" judgment. Even when checked by a wholesome recognition of the difficulties of popular enterprises, the "professed" historical student will be compelled to exercise no little charity and self-control when he turns, for instance, from the dozen or more stout volumes by Gardiner on the early Stuarts to a fifty page account of the same period.

However, there are many persons—not the public—who demand to know about the past, even in a small way, either thru curiosity or thru a desire to understand the present all the better, and no doubt the *History of All Nations*\* now being issued under the editorship of Prof. John Henry Wright is one of the most successful attempts of our time to meet the call of the hour for general history. In typography, binding and illustrations it leaves nothing to be desired.

An instalment of five new volumes written by Dr. Philippon brings the story down to the eve of the French Rev-

<sup>5</sup> THE KENTUCKIAN. By James Ball Naylor Boston: C. M. Clark Publishing Co. \$1.50.

<sup>6</sup> IN THE SHOE-STRING COUNTRY. By Frederick Chamber. Boston: C. M. Clark Publishing Co. \$1.50.

\* THE HISTORY OF ALL NATIONS. By Martin Philippon. Vols. XI-XV. The Reformation and Counter-Reformation. The Thirty Years' War. The Age of Louis XIV. The Age of European Balance of Power. The Age of Frederick the Great. Lea Brothers & Co. Philadelphia.

olution. The first of this group contains the story of the Reformation and the counter Reformation in which Luther and Loyola, Charles V and Philip II, Mary and Elizabeth, Calvin and Henry VIII are the dominant figures. Volume XII is chiefly occupied with the Thirty Years' War. The next volume, covering the Puritan Revolution in England and the age of Louis XIV on the Continent, gives a remarkably well balanced account of this great century, with its Mazarin, Colbert, Cromwell, de Witt and Great Elector, and its Bacon, Milton, Racine, Molière and Newton. Three score pages are devoted to the Puritan Divine Right struggle in England, which sent Charles I to the block and made Cromwell arbiter of Europe; with entire justification the author gives half his volume to Louis XIV and the doings of his day in France and of Frenchmen in Europe. Nothing worth while seems to be left out—here is the Court of Versailles, with its deep political significance, where the sons of ancient kings, who shook their mailed fists at the rulers of France, are now wearing toy swords and holding a napkin at the Grand Monarch's table; here are the wars fought to enhance the glory of France until Louis totters to his grave after the Spanish Succession disaster; here are the Frenchmen of that great age—those who defend divine right, amuse, instruct and charm withal. But our author does not allow the dramatic movements of the age in France and England to overshadow and exclude everything else. In a telling pen picture he describes the state of broken, devastated and ruined Germany after the close of the Thirty Years' War; he does not neglect Spain, whose poor ruler can scarcely get trusted at the grocer's; nor divided Italy, the battlefield and spoil of Hapsburg and Bourbon; nor Turkey in Europe, with her Sultan approaching his long and painful "sickness"; nor Russia, whose great Peter busies himself with his armies and navies and towns and compels recalcitrant old Russians to shave their whiskers in spite of their fear of St. Peter's wrath on the last day. Conditions are described and policies are discussed; but this is not all. There is movement to the history; the Dutch and English fight for the sea; Louis XIV

defies the Pope; France extends the Rhine frontiers; Marlborough wins Blenheim. In general the facts are accurate, judgments are temperate—Cromwell's humility may have been feigned, but it was politically useful—and impressions well balanced. The author, however, is sometimes complacent, confounds the government with the nation, and speaks of the people with the looseness of the society editor who tells us that everybody is out of town in July.

The fourth volume of this group covers a more prosaic age than the first—from Utrecht to Frederick the Great's day. Instead of our stern and ponderous Cromwell we now have the fox hunting and jocose Walpole manipulating parliamentary majorities and laying the foundations of the cabinet system; we lose Milton and Racine, but we find the ambidextrous and pungent Voltaire, plying with his wit and fancy people of every type from the powdered, bewigged and perfumed boxholder at the theater to the serious reader of history and theology—a sort of Bernard Shaw with modifications; we no longer hear the sonorous sermons of Bossuet, but we now catch the strains of the immortal oratorios of Handel; we have left behind the divine right doctrines of James I and have come to the beatific visions of Rousseau and the state of nature thinkers. The old soldier, however, is not without his consolations in this volume. Here he may read at great length about the war of the Polish succession and the war of the Austrian succession.

In his fifth volume our author is more at home in his subject; he writes with more confidence, precision and swing, because Germany and Frederick are in the center of the historical drama. Here the general reader will find perhaps all he will care to know about the great hero of Carlyle; all the multifarious labors of this grim and witty King of Prussia are briefly described or at least indicated; he fights many battles in the Seven Years' War; he laughs or quarrels with Voltaire; he scolds negligent officials; drags judges from their benches while upholding the majesty of the law; when Baron von Mueller wants leave to go to the baths, he tells him to go to the devil; parishioners complain because their par-

son is shaky on the doctrine of eternal damnation, and Frederick tells them that the parson shall stay away and they shall have eternal damnation to their hearts' content; finances are reformed; swamps are drained and the religious refugees of other countries are invited to settle on Prussian lands; the curious patchwork of Prussian law is to be superseded by a great code; and yet Frederick finds time for the classics and to pronounce a panegyric on the dead Voltaire.

### Memoirs of Archbishop Temple\*

ONE of the stores still lingering in Oxford, relics of the days when Temple, then Bishop of Exeter, was Bampton lecturer, is, that he was wont to declare in the broad speech which in these volumes is discreetly ignored, "I thank my Gard every marning that I was barn a Carnishman," a story often quoted in opposition to another which alleged that he was of American, or possibly Canadian, descent. It is no reflection upon the truth of the story that he was, in fact, born in the Ionian Islands, where his father held a government appointment, in spite of which he was a Cornishman to his heart's core, and of partly Cornish, partly Scottish ancestry, from either of which he may have inherited that grit and thoroness which caused him to be described, as "granite on fire." The origin of the wide-spread story of his being of American descent may have come, in part, from the extreme practicalness of his character, and simplicity of his up-bringing, his skill in plowing and threshing, his physical endurance, the "go-ahead" qualities popularly attributed to this country, and partly perhaps to certain circumstances which associated him with the United States. Under his *régime*, at Rugby, perhaps in consequence of the popularity in America of "Tom Brown's Schooldays," many Americans visited the school and sent their sons there. (Vol. I., 229.) "The interest these Americans took in the school took tangible shape when a banner, worked by American ladies, was brought to the school, and formally presented."

Perhaps, however, Temple's main personal claim to interest American readers is that of his generous restoration to this country of the Bradford MS., the so-called "Log of the Mayflower," the existence of which, in the library of the Bishop of London's palace, at Fulham, was discovered by Senator Hoar, as vice-president of the American Antiquarian Society. The narrative of its finding and return is well told by Archdeacon Bevan, one of the seven friends who collaborated in the writing of what the general editor, Archdeacon Sandford, of Exeter, has truly called, "not a biography, but records of a career."

Temple himself practically forbade a biography, and during his lifetime did all he could to hinder the collection of material. This, his friends have interpreted, not as withholding the history of his work, to which indeed the public has a right, as having shared in it, but as shrinking from the violation of the reserve and dignity of his own personality. We have, accordingly, the history of Oxford in his undergraduate days, of Rugby in his pedagog days, of Exeter, London, under his bishopric, of Canterbury under his Archbishopric, of his work in all these places in the cause of temperance, of education, of social purity, of simplicity of life and worship; of his battle against extremes in religion and politics—each told, if one may so express it, by the specialist of the period, by his closest friend and companion in that particular sphere.

In view of the marked continuity of Temple's life-work, it is marvelous how these historians have contrived to make their narratives over-lap so little. Where they do, as for example, in the "Memoir of The Primacy" and the "Canterbury Memoir," and, in some degree, in that of "The Earlier Years" and "The Editor's Supplement," the reader does not grudge it; each tells the story from his own point of view, and in illustration of his own thesis.

Those who remember Dr. Temple best on that side exhibited by the schoolboy who said, "Temple's a beast, but a just beast," may be surprised at the countless instances quoted of his gentleness, kindness, and even tact. All who have come in close contact with him could add more,

\* MEMOIRS OF ARCHBISHOP TEMPLE. By Seven Friends. Edited by E. G. Sandford, Archdeacon of Exeter. New York: The Macmillan Co. \$9.00.

and none can fail to remember the bright smile which disarmed the recipients of his fiercest attacks; as, for example, the lady who asked at table, "May I give you some cold chicken?" "No, you mayn't. Wherever I go they give me cold chicken, and 'The Church's One Foundation,' and I detest both!"

**The Tower.** By Mary Tappan Wright. New York: Charles Scribner's Sons. \$1.50.

The faculty side of college life has lacked hitherto an interpreter. Mary Tappan Wright touches her new theme with a careful and loving hand; the faculty circle at Great Dulwich College consists of a masterful president and bishop, several young professors, a few pathetically overworked and underpaid old ones, with their wives, children and personal friends. They are well-bred and well-read—but are they quite alive? If we cannot feel any flesh-and-blood reality about them, is it their fault, or the author's, or our own? Certainly they live in a rarefied atmosphere, and under glass. Like all very limited circles, they know each other too well, and indulge in delicate vivisection of the emotions of their friends in a way that would appall the stoutest-hearted of psychological novelists. Life under a social microscope is bad enough, when the scrutiny is confined to externals, as in ordinary village gossip, but we protest that it must be unendurable when the examination pierces deeper, into dreams, motives and emotions, and forces the most reserved of men and women to yield up their inmost heart secrets. That strikes us as being much more of a trial than the long hours, hard work and meager salaries of which the author makes use to tragic ends. There is plenty of clever characterization in the book, and the people are sufficiently differentiated to be interesting. They invariably talk well. Miss Langdon is a charming type of the managing woman we all have known, who is so serenely sure that her friends cannot get on without her advice, and who does not hesitate to jog the elbow of Destiny, if the social jackstraws are not arranging themselves to her liking. It is a triumph of the author's skill that her heroine's meddlesomeness does not cost her our liking and

sympathy. The book is a tragedy of a dream. The attempt to relive a part of life which has been a memory for many years is sure to be a spiritual failure—we cannot unite the thread dropped and broken eighteen years before; the fingers are clumsy, the hands tremble, and the bungled knot will show. *The Tower* is the story of how a brave man attempted the impossible feat of living over again a cherished dream of his youth, and it contains, also, some pretty love-stories about his friends.

**In the Land of the Strenuous Life.** By Abbé Félicia Klein. Illustrated. Chicago: A. C. McClurg & Co. \$2.00.

The Abbé Klein's *Au Pays de la Vie Intense* has had more success in France than any other book on the United States written by a Frenchman in recent years. It passed thru seven editions in a few months, was crowned by the French Academy and awarded the Montyou prize. The present translation, made by the author himself, is remarkable as a translation. It is fluent, idiomatic and entirely free from gallicisms. There are a few mistakes, which we should have been inclined to attribute to the printer did they not appear in the index; for instance, "Thomas Dollyan, first Governor of New York." The Abbé appears to have been piloted in a very intelligent fashion by representative members of the Catholic clergy, and the observations he was enabled to make are exceedingly striking and suggestive. He has blended the narrative of his journey with the result of his inquiries in a very picturesque fashion. As a priest and a professor, he is, naturally, specially interested in religion and education. The freedom which Catholicism enjoys in the United States impresses him everywhere he goes. His enthusiasm for everything in America will seem, to many Americans, to be rather excessive, but he gives facts as well as impressions. The contrast between the prosperous and progressive condition of his Church here and that in his own country affected him the more forcibly, as, after sailing from Havre, he found a number of monks and nuns aboard, obliged to fly to a more hospitable land than that in which they were born. A fine feature in the Abbé's char-

acter is his entire freedom from religious prejudice. He is fully alive to the value of the educational and charitable work of the Protestant clergymen he meets with. Institutions like Bryn Mawr and Tuskegee appeal to him quite as strongly as Trinity College and Notre Dame University. That he is favorable to the American public school system may be gathered from several of his observations. "With France before one's eyes," he says, "it is hard to understand how any Catholic can be discontented with the freedom of America."

#### **Euripides and the Spirit of His Dramas.**

By Paul Decharme. \$3.00. Translated by James Loeb, A. B. New York: The Macmillan Co.

This is one of those excellent books that broad minded Frenchmen who know how to appreciate the work of their neighbors occasionally give to the world, and thereby earn great gratitude. It is no wonder that Mr. Loeb, with his cosmopolitan sympathies, recognized that he would win general thanks for giving it to the English speaking public. It may seem to some an easy task to translate a good book. But it is not an affair of any chance scholar who happens to know another language than his own. Into every good translation a good deal more than mere translation must be put. Of this the work of Mr. Loeb is a signal example. Here sympathy, not merely of the linguist, but of the man who has felt, comes to the front, and an almost new creation appears. Apart from the translation, a few notes from the translator's own hand appear. A pleasant feature of the book is the Introduction, by Professor John Williams White, who at the outset quotes the remark of Goethe to Eckermann, that

"a poet whom Socrates called his friend, whom Aristotle esteemed, whom Menander admired, and for whom Sophocles and the city of Athens put on mourning when they learnt of his death, must certainly have been somebody."

It is true that "our Euripides, the human," the most modern of the ancients, was put on the rack by Aristophanes, a much less noble man than himself; and in modern times Schlegel's elaborate disparagement has helped to lower him in the esteem of some. His laying bare the

struggles of the soul, especially of women, "the secret stirring of nascent desires, the shyness or boldness of growing passion, its tumults and tempests," has done far more than his disregard of "the unities" to put him under the ban. It was for just this last item that Lessing, who hated regularity, loved him. Shakespeare would probably have agreed with Lessing. Perhaps Aristophanes could see nothing noble in the "Alcestis and Iphigenia." If that was the case he was hidebound. Euripides is perhaps unfortunate in having seventeen of his tragedies preserved, some of them carelessly composed. It is quite likely that Aeschylus and Sophocles might suffer in our esteem if we discovered a dozen dramas of each, of the grade of "The Seven Against Thebes" and "The Trachinian Women." Aristotle certainly shows none of that virulence toward Euripides which Aristophanes—a pretty censor of morals—feels called upon to show. With Socrates beside him, Euripides was in good company

**The Sage Brush Parson.** By A. B. Ward. Boston: Little Brown & Co. \$1.50.

No one who has camped in the Rocky Mountains will ever forget the strange, penetrating fragrance of the sage brush after a light shower or when pressed by the foot or crushed under the sleeping bag at night. One learns to love it, and the gray green shrub which grows where nothing else dares. *The Sage Brush Parson* is the story of a young Methodist minister who drops, as if from the sky, upon a Nevada mining town. We at once recall "Black Rock," "The Sky Pilot" and the numberless tales of Western life, all of them true in some points and untrue in others. There is a touch of exaggeration about them all; a fashion in miners and "bad men" set by Bret Harte and followed religiously by many men of less genius than he. A cowboy in his "chaps" and sombrero is a picturesque figure, but he is, after all, not essentially unlike other young men on a camping or hunting trip, care free, light hearted and freakish of spirit. Most of the characters in novels of Western life are either somber or grotesque distortions of the actual people who live be-

yond the Mississippi. *The Sage Brush Parson* sins less than many others in this respect, but it is not altogether blameless. One thing it does present with truth and vividness—the sudden and violent changes of opinion in a small town, persecution and popularity following each other with vehement swiftness as the breath of gossip blows, now hot, now cold, and the reigning favorite today becomes the reprobate tomorrow. *The Sage Brush Parson* reminds us, with a difference, of Theron Ware. Both are young Methodist ministers; they are temperamentally alike; they live in small communities among unlettered people, save for a little group of rich and cultured friends in another communion. They are alike tempted. There the likeness ceases; for the infidelity of one there is excuse, for the other, none. We do not like to have the problem of a story solved by a sudden and violent death—that is the resource of an incompetent or helpless imagination. “I don’t know what to do with this unnecessary person! He, or she, is in the way, and every one would be happier if the character were dead”; and the autocratic author orders immediate execution. People rarely die so conveniently in real life, and what our novelists should teach us is how to live in right relations to the disagreeable wives and husbands who continue to exist, and how to shape our own actions, so that we may not be impossible companions for them.

**Moral Overstrain.** By George W. Alger.  
Boston: Houghton, Mifflin & Co. \$1.00.

Any American citizen will be benefited by reading the eight essays on modern social and business problems contained in this little volume. They are sane without being commonplace, and interesting without being sensational.\* Mr. Alger has the rare ability to point out forcibly the serious and prevalent evils of the day without at the same time arousing the reader’s antagonism and distrust by exaggeration. In the essay on “The Literature of Exposure,” he shows that little permanent benefit can be expected from much of the newspaper scolding now in vogue. Other essays are devoted to the disinclination of the average citizen to serve on a jury, to the delay in

criminal courts, to “Unpunished Commercial Crime,” and similar vital topics.

**Bulletin of the Bureau No. 58.** Washington, Department of Commerce and Labor. Contains Victor S. Clark’s Monograph on *Labor Conditions in the Philippines* (84 pages) and on *Labor Conditions in Java* (48 pages).

At a time when a great deal of undigested information, along with some of real value, regarding the Philippines is being thrust upon a somewhat sated public, it is important that those who are really interested should have their attention called to what is of solid worth in the increasing bibliography of the subject. Our “Philippine problem” has from the first been made “confusion worse confounded” for the honest enquirer. Some fly-by-night investigator or stay-at-home dogmatist is too often treated as if he were an authority on the subject. Meanwhile, the rarer piece of careful study and investigation often is overlooked. This has been the case with the monographs of Dr. Victor S. Clark on Philippine and Javan labor conditions, issued as a bulletin of the Bureau of Labor at Washington. It is no exaggeration to say that the monograph on Filipino labor and allied problems is, all in all, the best economic study in the whole bibliography of the Philippines. It contains an amount of real research into actual conditions that appear in no other writing of this sort; moreover, it takes on a broad scope, relating the question of Filipino labor to the inseparable questions of political and social development allied with it, and in so doing the author, who shows that he has made no little research, is nevertheless careful to recognize his own limitations in this direction and avoids anything like dogmatism. His similar study in Java is quite as valuable, for comparative purposes, for students of the Philippines.

**The Positive School of Criminology.** By Enrico Ferri. Translated by Ernest Untermann. Chicago: Charles H. Kerr & Co. 50 cents.

By means of a very fruitful analogy between organic and social diseases this famous Italian criminologist presents the fundamental theory of the positive

school of criminology. Criminality can be repressed only by applying the laws of social hygiene, just as sickness can be repressed only by applying the laws of medical hygiene. Just as sickness and insanity were once regarded as evidences of moral guilt, so criminality has been regarded as the free choice of the criminal. But as these organic diseases came to be regarded as the necessary result of bad physical conditions, so the positive school regards criminality as the outcome of bad social conditions, which create abnormal men or make men act abnormally. Rejecting belief in a free will, it bases itself on the doctrine of economic determinism. In this respect it at once differentiates from the classical school, which believes in free will. Inspired by humanitarian feelings, this school has worked for diminution of punishment, but has not got beyond the point of regarding punishment as the only means of repression. But the positive school rejects punishment with the doctrine of free will, and regards treatment of the individual criminal only as direct and empirical repression of crime. It lays much greater emphasis on indirect, social repression of the causes of crime. In this book we have a concise statement by its most distinguished representative of the point of view of this new school of criminology, which seems destined to revolutionize methods of treating criminals and of dealing with crime. He has already stated this point of view in his longer work on criminal sociology, but in this book we have it presented still more forcefully and pointedly. Unfortunately this is a very poor translation, which frequently obscures the meaning.

**In The Country of Jesus.** By Matilda Serao. New York: L. P. Dutton & Co. \$2.00.

This is the pleasant narrative of a devout Catholic lady's travels in the Holy Land. Possibly no other region has afforded more material for the inquisitive, hastily enlightened student, whose chief business often is to deprive the simple reader of his harmless, simpler faith in some dear tradition. Thus we have lost much of the precious sentiment connected with "the country of Jesus" which is truer and more elevating to the soul

than any mere theological view of its history and topography. Signora Serao does not concern herself with this orthodox form of skepticism; she accepts the legends, illusions, delusions—all that poetry of spirituality which the religious imagination of saints has added to the land and life of Jesus. This is no invitation to quibble about historical details. Everything is sacred to the soul, and the reader has only to believe, in order to be blessed with the most restful impressions of a country where the stars are still close, shining upon the stable roofs in Bethlehem. And that this form of interpretation is preferred by the great majority of people is proved by the fact that this book has passed thru thirty editions since it first appeared two years ago.

**Irenic Theology:** A Study of Some Antitheses in Religious Thought. By Charles Marsh Mead, Ph.D., D.D. New York: G. P. Putnam's Sons. \$1.50.

The spirit of Dr. Mead's discussion of some of the principal topics of doctrinal theology is most praiseworthy. He endeavors to recognize the truth in opposing doctrines and to bring conflicting statements into larger harmony. Heretics have been defeated before now by a process of inclusion of their tenets, and the method of Dr. Mead is certainly the wiser and more Christian method of meeting theological error. The principal themes on which he seeks to promote concord are the immanence and transcendence of God, the humanity and divinity of Christ, the sovereignty of God and freedom of man, and the various explanations of the atonement. These are well-worn subjects, and the author will be in no danger of a heresy trial for his opinions on any of them. He pronounces in favor of what he terms the "paternal" theory of the atonement rather than the substitutionary or governmental theory, but he does not depart from the proof-text conception of scripture and his point of view is thru-out orthodox. One feels that the author, whose keenness and argumentative skill must be recognized, would have had stronger hold on those whom he seeks to reach had his interests and studies been more largely historical and critical

and social, and not so exclusively dogmatic and speculative.

## Literary Notes

THE latest volume of the *Dictionary of Quotations*, published by the Macmillan Co., contains quotations from German literature. Each is accompanied by its translation and there is an English as well as a German subject index. (\$2.50.)

....The Proceedings of the American Political Science Association meeting at Baltimore last December are published by the Wickersham Press, Lancaster, Pa. The chief topics discussed in the papers are municipal ownership, neutrality in war and negro suffrage.

....The advantages of a thoro organization of local charities to prevent duplication of work, friction and graft are well illustrated by the *New York Charities Directory* for 1906, published by the Charity Organization Society. The mere list of the charitable organizations of New York city occupies about 600 pages of the book.

...."Incompetent, irrelevant and immaterial," the formula that slips so glibly from the tongue of the opposing counsel in almost every lawsuit, is subjected to a critical examination in a little book by Theodore F. C. Demorest, entitled *Hints for Forensic Practice* (Banks Law Publishing Co., New York). Motions to strike out and disregard evidence are discussed clearly and concisely with full references to judicial decisions bearing on the subject.

....The booklet, "*The Double Doctrine of the Church of Rome*," by the Baroness von Zedwitz (F. H. Revell Co.) is interesting chiefly for its personal character. The Baroness was the principal benefactor of the Catholic University at Washington, but her closer relations with ecclesiastical magnates disgusted her, and she left the Roman Church, much to the pain of her old friends. In this little volume her main purpose seems to be to put an end to the surmise that her withdrawal is not complete, and her purpose is to show that there is an esoteric doctrine and practice that is immoral. Her portrait has been removed from the walls of the University.

....In the review of "Our Philippine Problems," by Prof. H. Parker Willis, it was suggested, from the fact that Judge Parker made use of his statements in the Presidential campaign, that the author's visit to the Philippines had a political animus. In denial of this Professor Willis wishes to make the following statement thru the columns of THE INDEPENDENT: "The suggestion that I went to the Philippines upon a mission political in character or designed to furnish material for any political campaign or party, or that I was in the service of, or employed by, or in any way connected with any political party or other organization of any kind whatever is absolutely untrue and is therefore an injustice to me. I went to the Philippines as the correspondent

of two newspapers and for the additional purpose of securing material for the book which I afterwards published and for a technical magazine of which I was then the editor. Such criticisms as I may have offered upon Secretary Taft's policies certainly had no reference to him personally, and the suggestion that I had even 'a touch of bias' against him is, therefore unwarranted."

## Pebbles

WHAT we need is not airships, but stockings that will wear.—*Baltimore News*.

"EXCUSE me," said the old lady with eyeglasses in the art gallery, "but haven't you got any more figgers in marble?" "These are all, madam," replied the polite attendant. "Is there any particular one you are looking for?" "Yes, I wanted to see the statue of limitations my husband was telling about."—*Milwaukee Sentinel*.

### "THE MUCK-RAKERS"

"WHAT are the bugles blowing for?" said Lawson-on-Parade.

"To turn us out, to turn us out," D. Graham Phillips said.

"What makes you look so white, so white?" said Lawson-on-Parade.

"I'm dreading what I've got to hear," J. Lincoln Steffens said.

They're exposin' the exposers; it would make your hair turn gray

To reflect what will come when they expose each exposé,

When they find a newer frenzy or a treason every day—

They're exposin' the exposers in the mornin'.

"What makes Charles Russell breathe so 'ard?" asked Lawson-on-Parade.

"It's bitter cold, it's bitter cold," U. Jungle Sinclair said.

"What makes Miss Tarbell look so faint?" said Lawson-on-Parade.

"A touch of sun, a touch of sun," S. Hopkins Adams said.

They're exposin' the exposers, they are callin' of 'em down,

They are huntin' of 'em hotly from New York to Packin' town,

They will chuck 'em in a lake o' ink an' let 'em swim or drown—

They're exposin' the exposers in the mornin'.

"I started all this bloomin' row," said Lawson-on-Parade.

"I think Miss Tarbell saw it first," Rex Beach rose up and said.

"What's all that noise that shakes the ground?" said Lawson-on-Parade.

"It's Teddy Roosevelt's muck-rake speech," a pale reformer said.

They're exposin' the exposers, there is trouble in the air,

There are Folks and Hadleys coming from concealment everywhere,

And they'll all write stuff, and talk, too, when they've got the time to spare—

They're exposin' the exposers in the mornin'.

W. D. Nesbit.

## Muck-Raking and Railroad Rate Legislation

LESS than three months have passed since Mr. Aldrich and those other Republicans of the Senate Committee who agreed with him intrusted the Railroad Rate bill and the defense of it to a partisan opponent and personal enemy of the President. They did not like the bill. They knew, as everybody knew, that it was satisfactory to the President and was practically his bill, embodying the views to which he had given the foremost place in the program of his domestic policy. By their action it was placed in the hands of Mr. Tillman, who was not only, as we have said, personally hostile to the President, but also a representative of the Democratic minority in a Senate where the President's party had a majority of nearly two-thirds. This curious movement was generally regarded as a somewhat defiant exhibition of their disapproval of the measure, and of their desire that it should enjoy no political advantage to which it might fairly be entitled.

It is this bill, but much strengthened and otherwise improved, that the Senate has now passed by a practically unanimous vote. The gentlemen who gaily placed it in Mr. Tillman's hands have voted for it. Some of them have proposed and vigorously supported amendments greatly enlarging its scope, and these amendments were adopted. All the so-called conservative Republicans, one excepted, all whom the public had counted on the side of the railroads, finally came to the support of the bill, with the radical provisions which, with their consent, had been added to it. What caused this interesting change in the space of less than three months?

It was due chiefly to the men with the muck-rake. But we would ascribe greater influence to the official muck-rakers than to the unofficial exposers of corruption, political, corporate and legislative. Each group of rakers had a share in the work. While some Senators were restrained and chastened by the searchlights of publicity shining upon the records of their lives, official investigations

were emphasizing the need of the proposed legislation. While the unworthiness of some had been exposed by the inquiry into the secrets of great life insurance companies, and some knew that the people were reading the story of their political and commercial and legislative intrigues, others felt the compelling weight of new evidence. Grand juries and the keen counsel of the Interstate Commerce Commission were raking up the muck of fraud and crime in the railroad service. Great railroad companies were being brought into court to answer charges of wicked conspiracy. Unwilling testimony was showing that other great companies had sought to control and monopolize important industries, had systematically oppressed and robbed the weak for the enrichment of the strong and of their own officers, had been guilty of discrimination and tyranny that were little short of piracy. It was proved that the great corporation which had stood at the head of American railways had been guilty of these offenses, that scores of its responsible officers had been bribed year after year by shippers who thus sought unfair advantages over competitors or strove to save their business interests from that ruin which a failure to give bribes might bring upon them.

To all this were added the results of the Government's inquiry as to the rate conspiracies of the railways thruout the country with the Standard Oil Company. Of discrimination by means of rebates and other secret preferences there had been abundant proof. In the Standard Oil report and the coal trade abuses was convincing evidence of an unjust manipulation and a wicked adjustment of the open freight rates. With all this foul muck in sight, who could continue to argue against the proposed grant of power to deal with the open rates?

As the evidence accumulated, conservative Senators became radicals in speech and act, if not at heart. Making all due allowance for those who are soon to seek re-election and have now a wholesome respect for public opinion, and for some others who know the rules of expediency, we may say that the great mass of fresh

evidence, with clear signs of public indignation, created or compelled an almost unanimous acceptance of the bill and its drastic amendments. Wherever there is muck, let the rakes be used.

The present bill is stronger and better, as we have said, than the one sent over from the House. As it stands now, it divorces railroads from the coal-mining industry; extends the authority of the Commission over pipe lines, express companies and sleeping car companies; restores the old penalty of imprisonment for givers of rebates; imposes extraordinary fines upon those by whom rebates are received; compels railroads to deal impartially with water lines competing among themselves; and forbids discrimination in providing switch connections, sidings or cars. By the original bill, private car lines, private terminals and all other devices used to promote discrimination were brought under the Commission's supervision.

Of that original bill the most important part, in our judgment, is that which opens the railway books. There is to be no more concealment. The companies must keep all their accounts, records and memoranda in forms prescribed by the Commission, and these accounts and records are always to be open to the Commission and its examiners. They must include even the movement of traffic and the distribution of cars. To make false entries in them, or to keep any other accounts or records than those prescribed, will be a misdemeanor punishable by imprisonment. Under such a law it will be very difficult for a railway corporation to conceal the proofs of unjust discrimination or preference. All this applies, it should be remembered, not only to the railways, but also to express companies, pipe lines and private car lines. Publicity not only suggests cures for many evils, but frequently is itself a remedy for them.

The original bill was defective in that it did not provide for a judicial review of any kind or vest any court with jurisdiction. But it assumed that courts would deal with the Commission's orders. Obviously no attempt to limit the courts' action was made. As the bill now stands, jurisdiction is specifically vested in the Circuit Courts to hear and

determine suits to enjoin, set aside, annul or suspend an order. The courts are left to decide for themselves what the scope of their review shall be. It is not clear that the scope could have been restricted by this or any other bill. At all events, it is better, we think, that the courts should be left free. We have heretofore pointed out that all who had opposed a broad review voted for the bill.

In measuring the influence of exposures and investigations that overcame opposition in the Senate we did not overlook, of course, the relation of Mr. Roosevelt to the bill or the great force of his earnest and persistent advocacy of the principles embodied in it. It is probably true that but for him there would have been no such bill either in the Senate or in the House. Even with his strong support, however, the Senate might have smothered the bill or made it worthless, if there had been no investigations, exposures and indictments. Still, these also were due in part to his action. "But for the work of Theodore Roosevelt," said Mr. Tillman, "we should not have any bill at all." This was due, he thought, to the President. It is due to Mr. Tillman to say that no other Senator has so grown in public estimation during this memorable discussion.

## Russian Revolution and the World Peace

OUR readers must be aware that they are now watching one of the most momentous, most tremendous revolutions in human history, a revolution in which the extreme of Russian autocracy is met by the extreme of popular radicalism, and which, by the sure success of that self-government which loves peace, will envelop Asia and waken it from its long sleep. For Russian representative government and popular development and education mean enlightenment and liberty not solely to its own millions, and vastly increased population filling its empty wastes, but the end of ambitious armaments and the advent of international peace the world over. And this victory of the people against the Czar and his councilors may be achieved this very year. Already the Duma has made

its challenge. The ducal cabal must yield, or there will be a bloody, instead of a peaceful, revolution.

The world's great movements, which are to reorganize and rehabilitate the nations, seem just now to be crowding together. Suddenly Japan humbled the most feared military nation of Christendom, and proved herself a Power of the first rank. But that was but the beginning, the auroral dawn of the new day for the East; and the sun of China is now struggling thru the clouds, and is rapidly rising into the eastern sky. China and Russia, side by side, are now creating their kindred revolutions. There remains Africa, where very soon we shall see momentous and portentous movements, for it is not long before it will be decided whether there shall spread all over the Continent such a cry of "Africa for the Africans" as we have seen in Abyssinia driving out the Italians, as in East and West Africa has for more than a year been resisting German rule, and as in Natal is now giving apprehension to the British authorities.

But now it is Russia that attracts all eyes; not solely for herself, but for the world. For Russian freedom and Russian peace are related to the peace of the world. Russia stands indeed in a peculiar relation to the political movement of the twentieth century. As our century began the Russian Emperor took the initiative in calling together the first general assembly of the nations. The outcome was an international court. Now the Russian Emperor has called the first general assembly of Russia. Within a few months after this assembly is convened, Russia will take part in the second general assembly of the nations, which will consider, among other things, the question of constituting a permanent international congress. No reason exists for creating a Russian House of Representatives which does not also call for the creation of an International House of Representatives, for the purpose of establishing a reign of law instead of the chaos of arbitrary action. Americans have taken the lead in proposing that the International Parliament be established, but even the most extreme advocates of this idea have satisfied themselves with demanding that such a body be called

into being. They are willing to wait for it to grow in power and in prestige by its demonstration of capacity to meet the needs of humanity. So that the United States stands to the creation of an International Congress as the Emperor of Russia does to the creation of a Russian Parliament, and it is to be hoped that, before the second Hague Conference convenes, the President of the United States will have taken a stand for the International Parliament as firm and as advanced as the Russian Emperor has for the Russian Parliament.

In this connection we need to recall that, only three-quarters of a century ago, a congress of the European powers assembled at Vienna and entered into an agreement to kill the idea of representative government as against hereditary government. This agreement united all the military power of Europe in a conspiracy against the idea of which the United States was the representative. This conspiracy was instigated by an ancestor of the present Emperor of Russia. It was joined by the ancestor of the present King of England. It was declared against by a predecessor of Roosevelt by the issue of the Monroe Doctrine. In three-quarters of a century the true idea in political affairs has destroyed this conspiracy, and has conquered every one of the conspirators, Russia being the last to surrender.

How can those at present in control of our Government hesitate to take a stand for the worldwide adoption of the parliamentary idea at the coming Pan-American and Hague conferences, in view of these facts?

The Pan-American program expressly calls for making suitable provision for future conferences. A careful analysis of the proposed program for the second Hague Conference shows that it only needs one amendment, namely, suitable provision for future conferences of the nations to consider such questions as the current of events may make paramount.

This addition to the program will be suggested on behalf of the American nations, and it is difficult to believe that the Conference can adjourn without suggesting some basis for the automatic assembling of such a conference. This done, we can watch the contemporaneous

growth of the Parliament of Russia and the Parliament of the Nations.

## The Dilatoriness of Architects

WE are glad to have our distinguished French critic, M. Paul Adam, praise our skyscrapers for their artistic merit. Perhaps this may tend to quell the anxiety of British and Continental artists who are shuddering in the fear that steel cage buildings should invade Europe. Perhaps, too, we shall hear less on this side of the water about the impossibility of artistic achievement in this country on account of the influence of commercialism. So far from commercialism killing art, as we are often told, commercialism is the only thing that keeps art alive. If it were not for commercialism art would stand still until it rotted in its tracks.

Artists are always timid, conventional and imitative. It is only by hard work on the part of the progressive members of the community that they are kept within hailing distance of modern life. At the head of the procession is the scientist, pushing always to the front, making new discoveries, pointing out new paths of progress. Close behind him in the race, almost abreast of him in this country, is the technician, eagerly seizing each new scientific discovery, and applying it to human needs. The artist would lag far behind, playing with the toys of the world's childhood, if commercialism did not get him by the ear occasionally and drag him forward, and what a squalling he does make at such treatment.

We are living in the Steel Age. Architects are still living in the Stone Age. One would think that they would welcome a new building material, especially one like steel, which gives them a new and most powerful weapon in their perpetual conflict with the law of gravitation. But no, they shiver in the face of the new opportunity. "Cover up the steel," they say; "pretend it is something else, and we will do the best we can to make its mask attractive." This is the way they have always behaved, even the best of them, when they were forced to adopt a structural material. The architects of the Parthenon tried to make a wooden building out of stone. They cut stone

pillars to represent the trunks of trees, they laid sham stone beams on top of them, and stuck out stone blocks to imitate the ends of rafters. As Sir Lawrence Alma-Tadema says, from Assyria and Egypt onward, the architects of Greece and Rome, of Romanesque, medieval and Renaissance times, had no other idea in their minds but, in working out constructively the fulfilment of contemporary requirements, to copy the styles which had gone before 'as they knew them.

This natural conservatism of the artistic temperament is, therefore, to be credited with some of the world's best architecture, but it must also be debited with many failures to cope with new conditions. It must be held responsible for the fact that most of our modern buildings of architectural pretensions fit us about as well as a conch shell fits a hermit crab. The Protestant Church has been thwarted and perverted by being forced into Gothic buildings, which are inconvenient for its purposes and alien to its spirit. If our artistic architects had had their way our business houses would be Greek temples and Roman mausoleums.

Fortunately the American people cared more for their own comfort, health and convenience than for academic tradition, so they have had their own way to a great extent in regard to the arrangement of their shops, office buildings and homes. In non-essentials, such as ornamentation, the artists have been given a freer hand. Here, then, they could have showed their originality if they had any, and here they have most conspicuously failed. A walk up Broadway and Fifth avenue is like going thru a museum. Some of the buildings are lucky enough to have got hold of a complete costume of a former generation; most of them have only a few rags and tags from the archeological scrap bag. We see gargoyles pretending to spout rain water on the heads of the people in the street contrary to the police regulations, hitching rings adapted for horses twenty feet tall if they stood on the sidewalk, torch extinguishers, altho our aristocracy have not as yet link boys among their retainers, artistic door knockers which are relieved from active service by unobtru-

sive electric buttons, elaborate hinges and locks, fortunately not relied upon to swing and fasten the doors, and gigantic lanterns designed to keep the wind from blowing out the light of the incandescent electricies.

It is, of course, only human nature to want to keep on doing what you are sure you can do well. Architects are like all of us, when we have learned how to tell a good story we bore our friends with it for the rest of our life. Take the staircase, for example. It was an awkward thing to manage architecturally, for it introduced a long, diagonal asymmetrical and notched line. Architects have a right to be proud of their triumph in conquering it and converting the ugly necessity into a thing of beauty, but that is no reason why they should make us walk up steps now when we can take the elevator. They still insist on putting monumental staircases into all our public buildings, altho nobody but the tourist and the photographer make use of them.

Modern elevator architecture has, therefore, had to get along the best it could without the help of the architectural artist, who stood off and laughed at it or moaned over it. In consequence of this divorce of the builder from the artist, most of our steel frame buildings are either stupidly plain or painfully ugly. Many of them have only one presentable side out of the four. They look like mammoth slices of jelly cake, or books bound in half morocco when they are off the shelves.

The problem has been most satisfactorily solved in the case of isolated skyscrapers of small area. As soon as it was discovered that these are really towers, it was plain sailing. For architects could do towers. They had been building them for six thousand years, or whenever Babel was. Here they could utilize the artistic experience of the ages, and the result has been most happy. In New York the *Times* building presents two good aspects, and the new Wall street towers are worth looking at.

There is no need to worry over our domestic and commercial buildings. They are now made comfortable, and they will, in time, be made beautiful. But our public edifices, especially our churches, museums and municipal build-

ings, are still in the grip of the dead hand. It is no wonder that in the minds of the people an artistic building is defined as one which is cold, dark and inconvenient. The Government employees in the dungeon cells of the New York Post Office look up with envy at the clerks in light, airy offices of the neighboring skyscrapers. One of the reasons why Government ownership is not popular is because at present it means traditionalism in architecture. In almost every city there is a standing argument against it in the form of a public building, very expensive, slow in construction and awkward in arrangement, contrasting with the more commodious, quickly built and convenient steel frame buildings of private construction. Considered solely from the standpoint of architectural beauty, the palm must often be given to the building with which artists have had the less to do, and, as for permanence, well, at this time when the \$25,000,000 capital at Albany is falling down, and the officials of Cook County, Illinois, are obliged to leave their \$5,000,000 building and rent offices in neighboring skyscrapers, and the \$7,000,000 City Hall of San Francisco lies in ruins, with its steel tower standing, it is not wise to bring up the matter of permanence as an argument against steel architecture. At Stanford University the earthquake showed a philistine taste. It trimmed off from the buildings their exotic art, the flying buttresses, spire, arch and stonced facings, and left the laboratories and mission quadrangle almost unharmed. If permanence is a merit in architecture, a debatable assumption, the steel cage buildings, which have withstood the earthquakes, fires and tornadoes that have demolished their stone rivals, have the best of the argument.

### Apple Blossoms

THE daffodil hardly fades down into brown and green (it is a fine thing to die into some other dutifulness) when the cherry flings out its banners and then the plums. It is a sad spring when the cherry does not blossom well. It is the abundance of modesty—not arrogant display. It is innocence filling the gardens. Every household should be sur-

rounded with enough cherry trees to give it this spring baptism. Then blushes the apple—blushes not for itself, but in the fulness of its beautiful life. All life is sweet that looks forward to beneficence. The apple tree is already dreaming of the great apple crop; and in its beneficent joy it flames out into a hundred times as many flowers and hoped-for fruits as it can possibly perfect.

Each wild apple blossom becomes an apple, but it is crabbed and small. To produce a Northern Spy or a Baldwin nine blossoms must be sacrificed, to create, with ten times as much life force, one royal fruit. In our orchards there is, therefore, a vast superfluity of bloom—a survival of the beautiful. Nature does not like to give up any of her successful achievements. An apple orchard in full bloom is one of the most glorious things that she has achieved. This you see everywhere—a carpeting of the fields with flowers and tapestry in the woods. The beautiful is a direct object of nature, and is counted by her as important as the useful. And is it not also useful? An apple orchard, with only as many flowers as there will be apples, would be only a dull affair itself, but it would also take the poetry out of human hearts. The bees would surely have something to say about it, for they love the apple blossoms. There are thousands of pounds of honey gathered in the orchard. So also would many other insects protest against the sacrifice of these apparently superfluous flowers.

So well does nature love the apple blossom that it lives again in the ripened apple. Cut a thin, smooth slice straight across a ripe apple and hold it to the light. Lo, there, in all its exquisite sincerity, is the apple blossom—right at the heart of the fruit. Is it not always so, that a fine thought or achievement is somewhere immortal? Certainly nature means to have it so, and why shall it not be so with human beings? The future loves the past. The flower has a freer life in death. It is the soul of the apple. There it lies in the winter bins, and it does not fade until the fruit itself goes onward to some higher commission. So it is that the apple blossom has its own beautiful immortality.

Simplicity is the characteristic of an

apple tree, and homefulness of an orchard. Children climb the trees and old people love to sit in their shade. The blossoms make the air wholesome, loading it with ozone. Blue violets are found in the orchard grass, and if you will let them, grapes will clamber and swing their blue clusters among the enclosing limbs. All sorts of wild vines like to climb over the surrounding fences and sleep on the stone walls. An orchard should never be hemmed by costly or formal closures, but by the old rail fences or by the picked up rocks. Pastor Wagner might add to his kindly advice, Live in an apple orchard. It is a fine way to combine utility with beauty, and health with comfort. There is no tree in existence that is more beautiful or appropriate near a cottage. The farmer's home naturally is associated with this noblest member of the rose family.

There are certain other natural relationships of the apple tree besides those we have mentioned. The orchard has its own birds. The robin builds in the large elbows and crotches; the orchard oriole swings in the lithe limbs, and the yellow-hammer loves nothing better than the hollows that have been worked out by decay. If you will rap on the rim of his doorway, from the inside the younglings will rap back to you. It is a curious household, and a very happy one. All these birds are of the homely, homeful sort, as the apple tree itself is full of home. There are half a dozen of this sort of trees, with big arms, for boys to climb, and where poetry is taught. But of all, not one is so got up by Nature for human companionship as the apple. Up there, in natural seats, the youngster sees the world in a way to keep him clean and sweet. We do not know why it is, but almost always, among the hills of New England and of New York, there is a brook running thru the orchard. Is it a part of Nature's poetry, or do the folk find that the Spitzenberg thrives best and the Orange apple is the happiest with its golden load where the brook laughs and carries the dropping petals and fruit down to the meadows?

Spraying an apple orchard is one of the triumphs of genius. It illustrates the high water mark of brains' mastery. It is a comparatively easy matter for man

to command the horse and the dog and the cow, nor is it so very serious a task to control those creatures that still are wild. The birds for the most part we have been able to make allies, and even the toads minister to our being. It is in the field of insect life that man has met his most serious defeats. Thousands of men have been whipped by insects, and many of our deserted farms are nothing but battlefields where the human has been conquered. Grasshoppers have driven off a whole population. Insects destroy two hundred million dollars for the United States in a single year. To meet these minute and uncountable hordes was the task of science; and it is not defeated. It compels, however, every fruit grower to have a scientific training. That is what is coming about. It will not be many years before every farmer will be a chemist and an entomologist at least, if he be not also a good botanist and an ornithologist. No other branch of industry so comes into alliance with knowledge, and with such extensive knowledge.

But it is not the fruit only which needs care; the apple tree is also most dependent of all our trees. No man should plant an orchard who does not comprehend what a forest child he has adopted. It is even more reliant upon our protection and care than the pear tree. Left alone, an apple tree soon goes all to suckers and thorns. It lacks that self-sufficiency which belongs to a pine or a linden or an ash. These will work out their destiny alone, and by themselves will come to some sort of beauty and strength. An apple tree standing alone, in a distant pasture, always looks as if begging us to take it home to the orchard. It gives fruit to the cows and the sheep, but it looks distressed. Its limbs that hang low are nibbled and torn, and the whole top becomes a thicket. A world full of apple trees would have also to be a world of human folk. We belong to each other; we need each other; we love each other. He is a shameful farmer who has no orchard, or, having one, either neglects it or misunderstands it. The pink and the white petals are falling; when the trees have lost these, they will still be the sweetest retreat for the family or for the scholar. Here shall be our peaceful resort, far from the city's confusion.

## The Uses of Inculpatd Wealth

ONE of the Smith College professors, who has long held the chair of astronomy, has resigned her position, refusing to continue receiving the money of the College, because the College accepts gifts from Mr. Rockefeller and Mr. Carnegie. To her mind it is "tainted money," and she will have none of it. She must stand—and she is to be respected for it—by her own conscience as to what is right and wrong; and no part of her wages shall come from the income of their gifts, whether of buildings or endowment. At the least we respect her rigid conscience; but is her conscience enlightened from the stars?

A less rigid conscience might have pliantly excused her, and suggested that none of the money which has gone into a library or other building comes into her pocket; or that only a very small fraction of her wages is from the income of the tainted fraction of the common endowment. Most of it comes from the tuition fees paid by her pupils, and but a small part of the rest is from the implicated fraction of endowment. Nor is she affected by the excuse that the money has lost its taint when it has once passed into beneficent use. Once tainted, it is to her still tainted and unclean. She brushes aside all such quibbles, and declares that no remainder and no attainder of it shall soil her pocket.

Now, is she as wise as she is righteously and stringently good?

That money comes, we may presume, from two sources, or those kindred to them—from the Oil Trust and the Steel Trust. Let us apply her principle further and see how it will work.

Donald Campbell is a man employed in a Bessemer furnace of the Steel Trust. He is one of thousands getting his wages from the company, and he earns it, as she does, by seeing the stars, as they sputter from the molten metal. He is one of thousands. Hans Oelreiniger whirls an oaken oil barrel ten hours a day, dashing over it the blue paint with a broad brush. He is one of many thousands working for the Oil Trust. They get their wages wholly from these inculpatd companies. They are told that these companies are vicious, that their money is tainted, that they are receiving

the wages of cruelty and wrong, and that it is their duty to leave the employ of such criminal concerns. So they read Mr. Garfield's Report, and the stories of other investigators, and they, being honest men, who want to do right, at any sacrifice, are urged to follow the Smith College example and throw up their job, and keep their pockets empty but clean. They reply: "We are but one of tens of thousands of men who must support ourselves and our families by our labor. If we must stop work for this reason, all the others must, and the construction of steel, and the oil industry, and the railroad and other industries allied, must stop, and civilization must be paralyzed. Must we do this? And further, we earn our full money. We give good and over-abundant measure for it. Our money is clean when it reaches us, no matter how foul it was before. It is ours, earned by hard work, no matter from what big, tainted treasury it has been doled out to us. Society must have our product or society collapses. It is our duty to work, and our right to take our wages."

We think they are right. But how differs their case from that of the Professor? Why should she not say: "I, too, give good, hard and honest work for my wages. I earn it all, and the wages are small. Every cent of it, or even more, is cleanly earned. To be sure, it has come out of a college treasury, a small fraction of which has been supplied from the treasury of a company which has got much of its money by injustice; but there is no stain on mine, for it is all honestly earned. Further, if I ought to throw up my job, then all other teachers in any public or private school, any part of whose income has come out of corrupt sources, should do the same; and education would sadly suffer. Have I the right thus to insist upon it that the stain of wrong can never be washed off from gold?"

To our mind Donald Campbell and Hans Oelreiniger are right. The old Greek woman was the better philosopher who pulled the astronomer out of the ditch into which he had fallen while gazing at the stars, telling him that he should not keep his head in the heavens while his feet were on earth. And what will our impracticable moralists have?

Allowing that they are right, admitting all the charges of cruelty, corruption and greed made against these and other trusts and companies, allowing that there is as much blood on the money as is said, yet what is to be done with the money which these and other rich men are in present legal possession of? Shall they keep it, or shall they give it away? Let us suppose that they have a sense of wrong and want to give it back, how shall they do it? There is only one way, and that is to give it to the public. That is exactly what those say who declare that our whole social system is oppressive of the poor, and that the wealth of the rich should be restored to the people. How can they give it? There is no better way than to offer it to public institutions, to hospitals, schools, museums, parks, to the places where the people go and are benefited. Should those public institutions refuse to take and cleanse and use the money, it would be tantamount to telling these rich men that they must spend it on luxury and vice. We prefer that, if these men feel that, like Zaccheus, they have got any money by oppression, they should give it to Smith College or for the endowment of research, or for hospitals and churches; and no teacher or nurse or Rhodes scholar need feel that he is living on money that has not been properly cleansed.

#### The Civic Federation's Commission

There is hardly any better civic work that can be done than that now undertaken by the Civic Federation, which is sending out a commission of twenty-one members to Europe to make an unprejudiced investigation of the subject of municipal ownership and control of public utilities. As the Federation represents great wealth and also the laborers' unions, so the commission is composed of members of various classes, and will study all the phases of the question. It was a notable occasion last Monday evening when, at a farewell dinner, there were addresses made that came to the core of the difficulties. Supreme Court Justice Gaynor of Brooklyn declared with great emphasis that the present distrust was not against wealth as such, but against the proved injustice and corruption in

the administration of great corporations. He spoke particularly of railroad and traction companies, and the multiple watering of stock, and the consequent fleecing of the public. Two seats from him sat August Belmont, who is not only president of the Civic Federation, but at the head of the greatest traction company in the world; and he replied denying that he or his associates have managed these corporations in any other spirit than that of honesty and correct purpose, or with any other view than that of complying with every letter of the law. In sending out this commission he said he and those he represented were of open minds, and ready to accept the facts learned and to abide by them, even if it led to municipal ownership, even of public transportation companies. As this country is so much behind Europe in public ownership of utilities the influence of this fresh study of methods and accomplished results may be very great with us. At any rate the harmonious working in the Federation of Capital and Labor is an omen of peace rather than industrial war.

**The Duma as a Representative Body** In spite of the complicated system of electoral colleges and the direct interference of the Government with the elections, the Duma is truly representative of the people, much more so in fact than our own House of Representatives, as the following table of occupations shows. The Duma now consists of 444 members (ultimately 520), of whom the occupations of 341 are given, and with these may be compared, in classes roughly corresponding, 334 out of the 390 members of our House of Representatives:

| Vocation.                    | Duma. | House of Representatives. |
|------------------------------|-------|---------------------------|
| Peasants .....               | 166   | ...                       |
| Farmers .....                | 34    | 24                        |
| Professors and Teachers..... | 29    | ...                       |
| Lawyers .....                | 26    | 249                       |
| Workingmen .....             | 17    | ...                       |
| Merchants .....              | 17    | 7                         |
| Doctors .....                | 15    | 3                         |
| Clergymen .....              | 12    | ...                       |
| Journalists and Authors..... | 9     | 15                        |
| Public Officials.....        | 9     | 16                        |
| Engineers .....              | 5     | ...                       |
| Manufacturers .....          | 2     | 13                        |
| Bankers .....                | ...   | 7                         |

The Russians are manifestly more democratic than we are. Our theory is that laws should be made by lawyers, consequently they constitute nearly 64 per cent. of the House, altho they form only four-tenths of one per cent. of the people of the United States who are engaged in gainful occupations. In the Duma the peasants and workingmen together have nearly half the membership, notwithstanding the fact that the Government endeavored to cut down their representation by direct and indirect methods, and the socialist and labor union leaders boycotted the Duma. In the United States Congress, on the contrary, the laboring population has not one class representative. In Russia the peasants constitute 80 per cent. of the population, and in this country about one-third are classified as engaged in agricultural pursuits. We have here assumed that the class in the Duma reported as "rural proprietors" is approximately equivalent to those in our Congress who put down their occupation as "farmers." Professors in universities and high schools, 21 in the Duma, are wanting in the American House, and the same is true of the clergy. The Duma has four priests and one bishop of the Orthodox Church, three Catholic curates, three Mohammedan mullahs and one Jewish rabbi. By profession of faith the Duma is composed of 357 Orthodox, 29 Catholic, 5 Protestant, 10 Jewish and 11 Mohammedan members. The House of Representatives obviously does not exhibit such a diversity of creed, altho we cannot give a classification for comparison.

**Governor Cummins's Move** Governor Cummins, like ex-Governor, now Senator, La Follette, is a man to be considered, for he has political initiative. What the Governor of Iowa now urges will yet be the policy of his party. He proposes to call a national convention looking to amending the Constitution of the United States. He has two particular points of amendment in view. One is the popular election of Senators and the other is the authority to impose an income tax, something which the Supreme Court has declared to be at present unconstitutional. Of course, a national

convention could not adopt any amendments; but it could discuss them and create such public sentiment that the States would adopt those proposed by the convention. Both of these propositions for amendment are desirable. In the State of New York a number of City Councils have taken action in favor of popular election of Senators. An income tax is the fairest form of tax, if not the easiest, that can be devised, and is adopted by most civilized nations. But when such a convention is called we hope that its scope will not be limited to these two proposed amendments. It would be well if the broadest reach could be given to its deliberations. Certain other matters should be thrashed out, especially those in which the representation of the Cabinet in the English Parliament differs from our plan. Equally the indirect election of the President needs change. After more than a century, there might properly be a full discussion of the modifications which experience shows to be needed.

**Mrs. Henderson's  
Victories** What with Mrs. Conger, the representative of Christian Science in China, and Mrs. ex-Senator Henderson as the missionary who has converted not her husband only, but Wu Ting-fang, the former Minister from China, to total abstinence, this is evidently the age of women. Mr. Wu declares himself a full convert not only to strict temperance, but also to vegetarianism, and he feels better for it, and will use his influence with his people for rice and beans and salads and nuts, as against chicken and roast pig. But Mrs. Henderson's greatest conquest was in her own household when a company of temperance women were called in to smash a thousand dollars' worth of precious wine on the city street. The ex-Senator did well, for is not county after county in Missouri using its local option for prohibition? And even from Germany comes the cry for reform, when the general failure of her athletes in the Olympic games is laid to the charge of general beer drinking, which weakens the heart so that it cannot endure prolonged physical exertion. So the doctors are helping those women, and the brewers and dis-

tillers have occasion for much concern when they look far ahead.

### The Passing of the Kimono

The dress of the Japanese women has been so generally held up for our admiration by travelers as superior to that of our women from both the hygienic and esthetic points of view that it is disappointing to hear that it is being abandoned by the young educated women of Japan. But the introduction of Western ideas of modesty, and the entrance of women into a wider life seem to necessitate some change. The students of the Woman's University of Tokyo are, some of them, adopting a reform costume introduced by Miss Smart, secretary of the W. C. T. U., of which the important features are the abolition of the obi and the kimono and the substitution of union undergarments and an outside gown with the waist and skirt sewed together. But the kimono is not likely to become extinct, for while the Japanese women are discarding it, our women are beginning to wear it, so its "passing" is merely trans-Pacific. Perhaps the women of Japan and of America could arrange a compromise having the advantages of both costumes.

### Mayor Dempsey

The English Government is, in one respect, more democratic than ours, because where the administration has become unpopular a vote against any proposition fathered by it is regarded by the Ministers as "a vote of want of confidence," and the Ministry thereupon resigns. This is the converse or voluntary side of what we know as the "recall," an electoral device by which the people are enabled to revoke the authority they have conferred upon an official who misrepresents them. Mayor Dempsey, who was elected upon the reform wave in Cincinnati and who has been "doing things" ever since, has found a practical and automatic application of this principle. He has not yet resigned, but he has announced that if those who are favorable to his policy are not elected next November he will consider it as a vote of want of confidence and will then resign his office of Mayor. Naturally this is not

popular with those reformers who believe that in order to purify the people it is first necessary to get, and then to keep, the offices, but to those who believe that the political Kingdom of Heaven, like the spiritual one, is really "within," this course is a new dispensation. If the people do not take an interest in their own business it is impossible for any one to run it properly for them; and if they want the gang back, as Mayor Dempsey sees and says, they certainly should have that gang back. To us it seems that nothing would be more likely to ensure the re-election of an administration favorable to the policy of a public servant. It is a frank statement that Dempsey is not serving for the sake of the office or the salary, but is willing to give it up at any moment when the people consider that they can be served better by some other person, policy or party.

Here is an idea that is not at all bad. Bishop Turner, senior bishop of the African M. E. Church, a slave before the war, tells the ministers of his Church who have literary or other titles, B. D., D. D., or P. E. (Presiding Elder), that they are supposed to know something and to be able to teach; and he calls out ninety of them by name from Georgia, and gives them each a subject, and tells them to get books and study it up, and then write a lecture on it, and lecture on it once a week till July of next year, rewriting it over and over again, and then he will print them in a book. The subjects are of immense variety, theological, scientific and literary, such as "Arminianism and Calvinism"; "Gravitation—is its theory invulnerable?" "Ham and his Posterity"; "The Gulf Stream and its Cause"; "Ghosts"; "Volcanoes"; "Was Noah's Flood Universal?" "Poetry"; "Bacteriology"; "Justin Martyr." This will set them at work, and the lesson would not be a bad one for men of titles and other colors.

It is announced that the Mormon Church will go out of business. That is, it finds that its financial ventures interfere with its religious functions; or, more likely, it finds that the American people and the Congress of the United States do not like the control of the Church of

the Latter Day Saints over the business and political conduct of the community. It has been reported that the Senate committee investigating the case against the Utah claimant do not find the polygamy case sufficient to exclude him from his seat, but that the rule of the Church in secular matters has led a majority of the committee to oppose his claims to his seat. We may fairly presume that it is prudential causes that lead to this reversal of a long continued policy, just as for similar reason the approval of polygamy was withdrawn.

There is a contrast between the policy of the Sirdar who rules Egypt and the Rand men who boss South Africa. The one brings peace and prosperity and the uplift of the people; while the other calls in foreign laborers to crowd out their own people, and the result is oppression and insurrection. In the Sudan, says the Earl of Cromer, the scarcity of labor is not due to the lack of laborers, but to the fact that the sources of supply have not yet been properly opened up; and he refuses to import Chinese or Hindu coolies or negroes from Uganda. If a similar policy had been employed in the gold and diamond mines of South Africa, and the laborers had been properly encouraged by decent wages, the country would have been saved much loss.

There is again more trouble in Luzon. The Filipinos are some of them restless and dangerous. Is it strange? Why does not Congress do its duty in reporting and passing the Philippine bill, as urged over and over again by Secretary Taft? The delay is a disgrace to our nation. Think of it, that sugar and tobacco should selfishly stand in the way of the pacification and prosperity of our magnificent colonial possession.

It is just as well that the Indian Rights Association should bring the case to the courts whether the Indian Bureau has the right to use the interest of tribal trust funds for education in sectarian schools. The best way is to support first the public schools, and then distribute the rest *per capita* and let the recipients do what they please with their own money.

# Insurance

## Insurance Reform

THE latest report of the Mutual Life Insurance Company of New York, combined with the news this week that Mr. James McKeen, who was counsel for the Armstrong Committee, succeeds Julien T. Davies as General Solicitor for the company, shows that reform has set to work with a vengeance. The mismanagement in the three large life insurance companies which was unearthed last summer by the Armstrong Committee is undoubtedly being done away with, since entirely new executive officers have come into power. The statement referred to shows that over a million and a quarter dollars of new premiums were actually received by the Mutual during the first three months of the present year, an amount which is practically fifty per cent. of the business done under normal conditions. This is a refutation of the popular idea that new business had nearly stopped coming in. And of special interest to policy-holders is the statement that there has been a total decrease in expenses during the first quarter of the present year of \$1,547,279.36, which means that the ratio of expense to income has fallen from 20.5 for the year 1904 and from 18.2 for 1905—when the reforms and economies were started—to 14.4, which compares with the ratio of earlier and simpler days of life insurance companies.

If this report is indicative of the results being accomplished in all the life insurance companies which have recently been under fire, it suggests two rather interesting thoughts. First, that the final results of a little personal quarrel between two gentlemen which brought to light certain conditions showing that investigation was necessary, has ultimately resulted in a vast amount of good, and that the aforesaid gentlemen deserve our hearty thanks—tho they would probably not be inclined to say "You're welcome!"—and, second, that the general public should realize that insurance reforms are already well under way, that the financial soundness of all three of the large companies was never for a moment questioned, even during the heat of investigation, and that, with their new management in force, the policy-holder may put

away his fears for the future and congratulate himself that he was not foolish enough to let his policy lapse when things looked dark.

✱

## William Frederick Dix

MR. WILLIAM FREDERICK DIX, the new secretary of the Mutual Life Insurance Company, was born in Newark,

N. J., November 18, 1867. After graduation from Princeton University in 1889, he traveled extensively in Europe and Asia. Upon his return home he engaged in literary work, and in 1894 became literary editor of *The Churchman*. He was subsequently editor of the *Home Journal*, and so continued when that publication was changed in name to *Town and Country*. Mr. Dix is an active member of the Society of Colonial Wars and of the Reform Club. Mr. Dix has contributed prose and verse to the leading magazines, and a new book from his pen, entitled "Adventures of an Old Furniture Collector," is for autumnal publication.

# Financial

## Growing Foreign Trade

Our foreign trade continues to be very large. Reports for April point to a total for the fiscal year much exceeding that of any year in the past. The gain in exports and also in imports for that month over April a year ago was a little more than 12 per cent. For the ten months ending with April, both the exports and the imports were much larger than in the corresponding months of any preceding year. Values of exports and imports of merchandise for April and for ten months in the last three years are shown below:

|               | APRIL.        |               |                 |
|---------------|---------------|---------------|-----------------|
|               | 1904.         | 1905.         | 1906.           |
| Imports ..... | \$83,521,882  | \$95,110,288  | \$107,327,038   |
| Exports ..... | 109,880,405   | 128,575,374   | 144,491,909     |
|               | TEN MONTHS.   |               |                 |
| Imports ...   | \$829,231,975 | \$934,540,402 | \$1,020,881,835 |
| Exports ...   | 1,277,715,480 | 1,273,614,611 | 1,488,393,999   |

A large increase is also to be seen in the foreign trade of Canada for ten months. Imports (\$225,257,000) show an increase of \$25,280,000, and exports (\$189,757,000) an addition of \$35,815,000.

## Telephones and Telegraphs

ALTHO the special report on telephones and telegraphs, issued last week by the Census Bureau, relates, with respect to the greater part of its statistics, to the year 1902, its totals and comparisons are not without value at the present time. In one table it is shown that on January 1st, 1905, the United States had 3,400,000 telephones and Europe only 1,485,784. Turning back to 1902, the report points out that in that year the telephone systems of this country operated more than three-fourths of all the wire mileage (used for telephones and telegraphs), gave employment to seven-tenths of the wage earners accredited to the two methods of communication, paid more than two-thirds of the wages, and received more than twice as much revenue as was taken by the telegraph companies. Telephone companies had 4,900,451 miles of wire, and the commercial telegraph companies (railway systems not included) only 1,318,350. Even in 1902 there were nearly 5,000 independent farmer or rural telephone lines, but their average length was only 10 miles of wire. In that year there were

more than 5,000,000,000 telephone messages, Ohio standing first in the list and Illinois second. San Francisco had the largest number of telephones in proportion to population, Cleveland was second and Boston third. On the average, for the whole country, there was a telephone for every 34 persons. The public then used the telegraph at the rate of only a little more than once a year per capita, but the number of telephone messages was 65 per capita. In salaries and wages, \$36,255,000 was paid by the telephone systems, and \$15,039,000 by the commercial telegraph companies.

DURING the past year deposits in the State banks of Kansas have been increasing at the rate of about \$1,500,000 a month.

....The quarterly dividend of 1 per cent. on the common stock of the National Lead Company, declared last week, is the first on the common shares since 1900.

....The Standard Oil Company's dividend for the current quarter is 9 per cent. Since 1899, the annual dividend has ranged between 48 and 36 per cent., but has fallen below 40 only once, in 1904, when it was 36.

....The Real Estate Trust Company, of which Henry C. Swords is president, has changed its name to the Fulton Trust Company of New York. It does a conservative trust company business in all its various branches, and not a real estate business; but its original name often led people to think that, like some other corporations having similar titles, it was engaged in real estate trading and operations.

....Charles A. Sackett, for four years vice-president, was last week elected president of the Mutual Bank of this city. Mr. Sackett was vice-president of the Union National Bank of New Orleans before coming to New York, and before that was in the banking business in Brooklyn, where he was born and educated. The capital of the Mutual Bank is \$200,000, the surplus and undivided profits are \$296,227, and the total resources are \$4,460,473.

VOL. LX

NEW YORK, THURSDAY, MAY 31, 1906

No. 3000

## Survey of the World

### Effect of a Novel Upon Legislation

Without debate, a dissenting vote or the formality of reference to a committee, the Senate passed, on the 25th, an elaborate bill containing stringent provisions for the sanitary inspection of all meats, fresh, canned, or otherwise preserved, which are prepared for domestic consumption at the slaughter-houses and packing-houses in Chicago or elsewhere. This bill, introduced by Mr. Beveridge only three days earlier at the suggestion of the President, was attached to the pending Agricultural Appropriation bill as an amendment, just before the final vote upon that measure. The introduction and passage of it were due mainly to the confirmation, by investigation, of the statements made in Upton Sinclair's novel, "The Jungle." At the President's request, Mr. Sinclair laid before him at the White House the record of his experience in Chicago's "Packingtown," disclosing the sources of his information and showing the strength of the evidence in support of the assertions made in his novel. A similar statement was made by Mr. Sinclair in THE INDEPENDENT of May 17th, in an article entitled "Is 'The Jungle' True?" Mr. Roosevelt caused an investigation to be made in Chicago by Labor Commissioner Charles P. Neill and Mr. James B. Reynolds, of New York. Altho their report has not been given to the public, it is understood that it substantially confirms, as we have said, what Mr. Sinclair had asserted or pointed out in his novel. When the Beveridge bill was introduced this report was in the President's hands. Strenuous objection to the publication of it was made by representatives of the cattle industry, and nearly 1,000 telegrams of protest were received at the White

House. It was expected that the report would be sent to Congress with a message from the President, urging the necessity of stringent legislation. To protesting representatives of the cattle industry and of the packers, as well as to certain Senators who asked that the report should not be given out, the President said that it might not be necessary to publish it if the Beveridge bill should be passed promptly. And then the bill was passed, without debate or opposition. Existing law provides for sanitary inspection of meats which are to be exported; this bill calls for an even more searching inspection of meats which are to be consumed at home—a thoro official examination, by Federal inspectors, of all carcasses, or parts of carcasses, of cattle, swine, sheep or goats, which are to enter into interstate commerce, with the tagging of each one. Clean and healthful surroundings and conditions in the slaughter-houses are required; carcasses unfit to be eaten must be destroyed; the use of dyes or other coloring agents is forbidden; packers who exclude inspectors from their premises are not permitted to engage in interstate or foreign trade; no vessel having on board meat consigned to a foreign port may be cleared until evidence has been produced that the meat has been inspected and approved. The penalties for violations of the law, and for attempts to bribe inspectors are severe, being heavy fines and imprisonment for two or three years. Interstate carriers are forbidden to accept carcasses or meat products unless they bear the required inspection tags and are accompanied by a certificate showing that the slaughter-house or packing-house from which they come has been inspected and pronounced clean and wholesome.

Packers are to pay the cost of inspection, which will probably exceed \$1,000,000 a year. Mr. Sinclair now says that the report of Messrs. Neill and Reynolds should be published, arguing that the bill is in adequate and that the people should have all the facts in order that they may be led to take measures for their own protection by local legislation. He repeats his charges against some of the leading packers of Chicago, remarking that he has in vain invited them to sue him for libel. Senator Cullom, Speaker Cannon and Representatives Lorimer and Madden have called at the White House to present, in the interest of their packer constituents, some objections to the bill. The President said he was convinced that such a law was needed. He desires prompt and favorable action in the House. It is thought that delay and opposition there would convince him that Congress ought to have the Neill-Reynolds report, accompanied by a message.

**The Pennsylvania's Coal Interests** Much additional testimony concerning the interest of officers of the Pennsylvania Railroad Company in coal mines has been taken by the Interstate Commerce Commission. William A. Patton, President Cassatt's assistant, admitted that he had acquired more than 6,000 shares of stock, in a dozen coal companies, these shares having a par value of \$307,000, without paying any money for them. President Cassatt knew, he said, that he had these shares. First Vice President Green owns no coal shares; Theodore N. Ely, Chief of Motive Power, owns shares, but he paid cash for them at their par value; Mr. Patton's chief clerk, J. N. Purviance, has \$38,500 worth, for which he paid nothing; Third Vice President Rea has been largely interested in coal land syndicates, but he expressed the opinion that no officer engaged in distributing cars ought to own coal stocks; James U. Crawford, agent for branch lines, holds stock of companies in which Vice President Rea and Effingham B. Morris are interested. Mr. Morris is a director and a member of the committee appointed by the board last week to investigate as to the facts brought out by the Commission. A

trainmaster, Frederick Vrooman, admitted that mine-owners frequently paid him small sums, from \$5 to \$20. He saw no impropriety in this. "If there was money to be given," said he, "I was there to take it." On the other hand, J. K. Johnson, superintendent of the Tyrone Division, said shares had frequently been offered to him, but he had always refused to take them, believing that it would be improper for him to do so. F. A. Von Boyneburgh testified that the business of his coal company had been ruined because it could get no cars. The number was reduced from 4,100 in 1901 to 522 in 1905. He believed he had been frozen out by President Cassatt, and that he suffered because he would not give shares of stock to railroad officers. John Lloyd, interested in coal companies and also partner in a banking house with President Cassatt's brother, admitted that he had given \$25,000 in shares to General Superintendent Sheppard and \$10,000 to another officer. It was a good business policy, he thought, to have the friendship of influential officers. One of his companies, with only 10 per cent. paid in, yielded a return of 165 per cent. (upon the full par value) in ten years. There was much testimony tending to show great discrimination in favor of the Berwind-White and the Keystone coal companies, which are commonly associated by the public with the Cassatt family. Coal of the first of these was not weighed *en route*, and the company had exclusive control of a pier in Jersey city, for which it paid a small rent, altho the railroad company had expended a large sum on it. The Berwind-White Company's treasurer refused to give the names of the company's stockholders. President Cassatt has changed his plans and has hurriedly taken passage from France for New York. The minority stockholders of the railroad company will ask for an investigation by the State as to the purchase of supplies. Inquiry on this point cannot be made by the Commission. Suits involving \$3,000,000 have already been brought by shippers on account of losses alleged to have been caused by discrimination. It is thought that there will be more than 100 such suits, involving \$25,000,000. The Commission, it is said, will now turn to the New York Central.

### Freight Rate Questions

In the House, by the adoption of a special rule, the Railway Rate bill, with the Senate's important amendments, has been sent to conference. The House thus far declines to concur with the Senate as to any of the latter's amendments, altho eventually it will probably accept nearly all of them. Mr. Williams, the Democratic leader, desired that the House should promptly accept those which relate to express companies, sleeping cars and switching facilities, in order that the conference committee might have no authority to deal with these. Twenty-five Republicans joined the Democrats in supporting him, but he was not successful. Some feared that the conferees would cut out important amendments which the Senate has added. In the debate, Mr. Cooper, a prominent Republican, said he had been told that a conversation had been overheard in which two men who were to serve on the conference committee had agreed that the amendment including express companies should be rejected. When Mr. Hepburn demanded names, Mr. Cooper replied that one of the two men was Mr. Hepburn himself. (It was understood that the other man referred to by Mr. Cooper was Senator Aldrich.) Mr. Hepburn denounced the report as a falsehood.—An article contributed to one of the magazines by James Creelman contains the report of an interview with President Cassatt, of the Pennsylvania road, in which the latter supports President Roosevelt's railroad rate policy. Mr. Creelman then, narrating the experience of President Cassatt with rebaters, says that when Mr. Cassatt assumed control of the road in 1899 he "found that the greatest of rebaters, so far as his company was concerned, was not the Standard Oil Company, but Andrew Carnegie," whose steel company shipped about \$10,000,000 worth of steel and iron over the road every year, the rebates on this traffic running up to great sums. He also asserts that when these rebates were discontinued, Mr. Carnegie was very angry and threatened to injure the Pennsylvania road by constructing competing lines. This statement, which seemed to have the support of Mr. Cassatt, was brought to the attention of Mr.

Carnegie, then on the ocean, and he replied as follows by wireless telegraph:

"Strange that I, who fought the Pennsylvania road most of my career, should be favored. Was with Vanderbilt building South Pennsylvania to Pittsburg, with Gould getting Wabash into Pittsburg; built, myself, the Bessemer road to Pittsburg from Conneaut—all to compel the Pennsylvania Railroad monopoly to give us rates equal to those obtained by competitors outside its grasp. Never asked for anything better. Cassatt is entitled to credit, doing more than any other railroad official to establish equal rates for all by reducing extortionate rates of his predecessors and inducing other railroad systems to advance theirs."

On the other hand, in support of Mr. Creelman's assertion, First Vice-President Green, of the Pennsylvania road, said, two days after the reception of this wireless message: "Our records show that the steel companies governed by Mr. Carnegie received more rebates, during the time when rebates were given by our road, than any other shipper in any line of business."

**Gas Prices in New York** Conflicting action of the Federal and of the State courts make a complicated situation in the city of New York with respect to the new law reducing the price of gas from one dollar to eighty cents per thousand feet. Interests representing the gas company procured from Judge Lacombe, of the United States Circuit Court, a temporary injunction restraining the State Gas Commission, the Attorney-General, the District-Attorney and other State or local officers from enforcing the law, the company alleging that it could not manufacture and deliver gas at eighty cents, except at a loss, and that the law was unconstitutional. Pending final action, the company is required to pay one-fifth of its receipts for deposit in a bank, this money to be restored to consumers if the law is sustained. There was also obtained a similar order forbidding one of the company's subsidiary corporations to accept less than one dollar per thousand. On the other hand, applications to Judge Bischoff, of the Supreme Court of the State, by certain newspapers and organizations, have procured from that judge temporary injunctions in the interest of consumers and in support of the statute. These injunctions restrain the company

from refusing to supply gas to consumers who decline to pay more than eighty cents, and from so changing the machinery of the slot gas meters (of which there are 110,000 in use) that they will sell at one dollar instead of eighty cents. It appears that the company did readjust a considerable number of these slot meters to conform to the new law, and that it desires to restore them to their original condition. There is also pending an order requiring the company to show cause why it should not be compelled to adjust all of these meters to the requirements of the new statute. It is pointed out that if Judge Lacombe's injunction be made permanent, a long time must elapse before a final decision can be obtained from the Supreme Court at Washington, and that many millions in money must accumulate in the bank in which the excess of one-fifth is deposited. The company, while declining to accept eighty cents from those who refuse to pay more, will not seek by legal action to compel the payment of one dollar, but will let the full amount stand as a charge against the consumers of this class. The company which supplies gas in Brooklyn borough now collects only eighty cents, saying on its bills that it will hereafter hold consumers liable for twenty cents more, if the law shall be pronounced constitutional. Among those retained by the State authorities to represent them in proceedings for the support of the statute is Mr. Hughes, who was the examining counsel in the life insurance investigation.

**The Isthmian Canal** When the Sundry Civil bill is reported in the House, it will carry an appropriation for the construction of a canal with locks. The chairman, after making inquiry, recently said that a large majority in the House preferred such a canal. It is reported that a majority in the Senate desire a canal at the sea-level, and that there may be a prolonged contest over the appropriation. Chief Engineer Stevens, who returned to this country last week, says that a point has been reached where the builders of the canal must know whether it is to be at the sea level or to have locks. From 15 to 20 years, he adds, would be re-

quired for the construction of a sea-level canal, but one with locks can be made in 8 or 9 years. Secretary Taft's estimate is 8 years.—Owing to the correspondence recently sent to Congress by the President, concerning the purchase of machinery or material of foreign production, the Senate Committee on Finance has reported a joint resolution providing that purchases of material and equipment for the canal shall be restricted to articles of domestic production or manufacture, "unless the President shall, in any case, deem the bids or tenders extortionate or unreasonable." Secretary Taft desired to buy two sea-going dredges, which were offered in Scotland at \$654,000, while the lowest price in this country was \$724,000.—Because some disturbance is expected in the Republic of Panama at the elections on June 24 and July 1, several hundred American marines will be placed at points not far away. There are 200 in the Canal Zone. The cruiser "Columbia" has gone to Guantanamo with 400 on board. Leading representatives of the Liberal party are on their way to Washington, where they will urge our Government to take measures for securing a fair election.

**The West Indies** Cuba's Commercial treaty with Great Britain, which has been pending a long time, was reported in the Senate last week with amendments designed to remove the objections of our Government. These amendments will probably make the treaty unsatisfactory to Great Britain.—S. H. Percy, a prominent American land owner on the Isle of Pines, is in Washington, where he recently sought an interview with the President. The latter declined to see him, but suggested that he should call upon Secretary Root. Mr. Percy predicts that there will soon be an insurrection of the American settlers, if our Government does not take possession of the island. He complains because Cuba has quartered a regiment of negroes there.—The Cuban House has appropriated \$500,000 to be used in subventions for several railroads, branches of the Van Horne system, at the rate of \$6,000 per kilometer.—In Santo Domingo there is a new revolution

in the interest of ex-President Jiminez, whose supporters have the aid of the friends of ex-President Morales. Arms have been shipped to the island from St. Thomas. On the 23d, Macoris was attacked by the revolutionists, who released the political prisoners confined there. They attacked Guayabin on the following day, and killed General Monjo, the Government's representative at that place.

**Venezuela** President Castro, who resigned from the Presidency of Venezuela a few weeks ago, now announces that, instead of returning to power, as the world expected, he will permanently abdicate. This announcement was made on the anniversary of the Restoration, when Castro entered Venezuela at the head of his army and marched upon Caracas and made himself President. Even now the world does not know whether to take this abdication seriously or not. In the meantime, it is reported in the *New York Herald* that a serious controversy between the United States and Venezuela is in progress of incubation, resulting from the activity of Rudolf Dolge, the American "laundryman" and consular agent at Caracas, and trusted friend of ex-Assistant Secretary of State Loomis. It seems that Mr. Dolge has been active in exploiting commercial concessions in the Orinoco Delta and has several claims that Castro is disregarding.

**British Politics** Between the sharp criticism of Mr. Chamberlain on one side and the growing disaffection of the labor members on the other, Sir Campbell-Bannerman's lot is not a happy one. The opposition to the Education bill is not dying down. As the popular agitation of the question continues the extremists on both sides are becoming more determined and emphatic in their demands, the High Church people for denominational instruction and the labor leaders for complete elimination of religious instruction in the public schools. The Aliens bill introduced by Mr. Keir Hardie prohibiting the importation of laborers as strike-breakers during a labor dispute passed the House of Commons without discussion, but was rejected in

the House of Lords by a vote of 96 to 24. Mr. Hardie blamed the Government for not espousing the cause of the bill and so securing its passage. He said the treatment accorded to the bill raised the question whether the democracy of Great Britain was to be a reality or a sham. The resentment of the Laborites against the Lords took, on the following day, the somewhat amusing form of opposition to an appropriation to provide an elevator for the House of Lords, so the aged and infirm members would not have to climb the stairs.

### The Spanish Marriage

All Spain is given over to public rejoicing and festivities because of the marriage of King Alfonso with Princess Ena of Battenberg. After a good-by dinner at Buckingham Palace, given by King Edward in her honor, the Princess Ena left on May 24th for Spain. Her special train was met on the frontier at Irun by the young King. The royal train was profusely decorated with white roses, lilies and chrysanthemums, and the station at Irun was festooned with Spanish and British flags. At every station from the frontier to the capital official delegations and crowds of country people were assembled to do honor to their future Queen, making the fourteen-hour journey a trying one for the Princess Ena. In Madrid a floral station had been prepared for the reception of the royal train, consisting of arches decorated with flags of the two nations, and suspended beneath a huge crown of red roses and yellow jonquils. King Alfonso and Princess Ena appear frequently in public, greatly to the delight of the crowds in the street. King Alfonso's presents to the bride are said to have cost over \$1,000,000. They consist of the crown for the future Queen of gold set with brilliants, a diadem, a collar of pearls, and one of rubies and sapphires, a pair of golden bracelets, a pair of pendants and a large diamond brooch. The wedding dress is of Spanish silk, profusely embroidered with silver, and in design, manufacture and materials is altogether a Spanish product, except for the fine Brussels lace which is used as trimming. On account of the

King's fondness for automobiling, a unique feature of the festivities will be a procession of 133 motor cars from the Hippodrome to the El Pardo Palace. The official program of the wedding is as follows:

May 29—Arrival and reception of foreign princes and a representation at the theater of the Pardo Palace.

May 30—Official signing of marriage agreement at the San Jeronimo Church Monastery.

May 31—Marriage ceremony at St. Jeronimo Church at 11 o'clock.

June 1—Gala banquet at royal palace.

June 2—Flower battle and gala representation at the opera.

June 3—Religious feast and gala ball at the palace.

June 4—Royal bullfight.

June 5—Excursion toward Aranjuez; luminous cortege and departure of foreign princes.

June 6—Banquet at the palace in honor of the authorities.

June 8—Reception at the palace and ball at the Opera House; departure of the King and Queen for La Granja Palace for honeymoon of two weeks; the royal couple later going to San Sebastian for the summer.

### The Czar Refuses

The conflict between the Czar and his people reached a definite crisis on May 26th when Premier Goremykin refused in the name of the Emperor to agree to the proposals of the Duma's Address to the Throne. As it had been assumed that the Czar's reply would be unsatisfactory, and that a crisis was therefore imminent, the great hall of the Tauride Palace was more crowded than at the opening day of the Duma. Almost the entire Cabinet was present on the ministerial benches, the Grand Duke Nicholas Nicholaievitch occupied the Imperial box, and many diplomats, including Ambassador Meyer, with their families were present. Premier Goremykin read the statement of the Government hurriedly, and in a low, weak voice that could hardly be heard in the rear of the hall. It was received with an ominous silence without the least applause at its close. The statement of the Government was worded in a vague and timid manner, suggesting compromises on most of the proposals of the Duma. The Government, the Premier said, was disposed to concede the demand for universal suffrage for men and women, but suggested that the Duma has not had experience enough for

a discussion of the question at present. There must be special caution exercised in regard to the questions raised by the Duma of satisfying the immediate needs of the rural population and the working people, of framing a measure providing for obligatory elementary education, of making the wealthier classes liable for the payment of taxes, and of introducing self-government. The Council of Ministers, he said, attaches no less importance to the suggested laws relating to the liberty of the state of conscience of the press and of freedom of meeting and association, but in preparing these laws the Administration must be provided with effective means to prevent any abuse of the liberties conceded. With reference to the solution of the agrarian question by the transfer of the Crown appanages, monastery and Church lands, and by forcible expropriation of private landed property, the Council of Ministers holds it to be its duty to declare that such a method is wholly inadmissible. The Government cannot deprive one party of its possessions in order to bestow them on another. To contest the right of private possession of land would be to contest the right to possess any private property at all. Thruout the world in all degrees of development of civil life the inviolability of property constitutes the corner-stone of the wealth of the people and the fundamental basis of the life of the State. The questions of the responsibility of the Ministers and the abolition of the Upper House are outside the province of the Lower House, because they involve radical alterations of fundamental law. As for the proposed abolition of the exceptional laws and arbitrary rights of officials the Council of Ministers considers it is wholly within the jurisdiction of public administration, in which the Lower House has only the right of interpellation. The present exceptional laws, indeed, do not suffice in extraordinary cases to insure tranquillity and order, and the Ministers are therefore engaged in drafting more perfect measures to that end. In regard to the amnesty question, the pardon of prisoners convicted by the courts, no matter what form of crime may have been committed, is the prerogative of the Monarch. The Council of Ministers considers that it would

not be beneficial to the State to grant amnesty to persons implicated in murders and acts of violence while disturbances continue. The Council will devote itself especially to the peasant question to secure the abolition of the restrictions retarding the possession of land and to breaking up the social isolation of the peasant as a class. The migration and settlement of peasants on fresh lands is

confidence. M. Annitin, of Saratoff, said that the peasants had had their fill of promise; what they demanded and what they would have were land and freedom. "The Government asks us to emigrate. We do not want to, and will not do so. We demand land, and will accept no compromise." The peasant leader, Alladin, warned the Ministers that the Duma alone stood between the Government and

The Tauride Palace, St. Petersburg, where the Duma is now in session, was built by the Empress Catherine for her favorite Potemkin, in honor of his Conquest of the Crimea.

one of the chief cares of the Council of Ministers.

**The Duma Defiant** The program of Premier Goremykin was received by the Duma as practically a declaration of war, and a seven-hour debate ensued, in which every faction of the House attacked the Government in strongest language. The first to take the platform was M. Roditcheff, the leader of the Constitutional Democrats. He declared "It is not the Government, but the representatives of the people here assembled, who must decide what is the best for the welfare of the country." He declared the proposal of the Government inadequate and inadmissible, and demanded that they retire and give way to a ministry in which the nation could have

a revolution. "But even Parliament will be powerless if it is unable to satisfy the demands of the people. The elemental forces, once roused, will sweep both the Parliament and the Government to common ruin." The Minister of Justice addressed the House in a conciliatory tone, assuring it that the idea that the present Ministry stood for the old *régime* was an impression that was absolutely unjustified. The position of the Government was like that of the man building a new house, but obliged to live under a leaky roof until the new structure was completed. Professor Manalevsky, of Khar-koff, stated that the obligatory re-purchase of land did not infringe upon the principle of invalidity of property. The most notable example of this, he said, was the last purchase for the peasants in

1861. He asked the Ministers how they dared to affront the memory of the Czar Liberator. Finally Count Heyden, the leader of the most conservative party of the Duma, who had refused to join in the original Address, stated that he had hoped to work peaceably in the House, but that the Ministerial program had destroyed his hopes. He also demanded the resignation of the Cabinet. Both the Constitutional Democrats and the Labor Party presented resolutions in reply to the Government; that of the Labor Party was adopted with only seven opposing votes. It concludes with the following demand for a Ministry in accordance with the majority of the Duma:

"The lower House of Parliament considers that it is its plain duty to proclaim to the country its complete distrust of an irresponsible ministry. It regards as a most necessary change to the pacification of the country and fruitful work by Parliament the immediate resignation of the present Cabinet and its replacement by a Ministry possessing its confidence. Parliament thereupon votes to proceed with the regular order of the day."

By continuing its work of drafting the proposed land laws, the Duma places upon the Government any responsibility of a complete rupture. It is probable that the refusal of the Government to grant amnesty and provide land for the peasantry will precipitate a general strike and agrarian riots. Already the Terrorists are renewing their activity. On Sunday bombs were thrown in Tiflis and Sevastopol. In the latter city eleven persons were killed, including five children, and over 100 were wounded.

**Prussian Governmental Colonization of the Polish Provinces.** A short while ago the Colonization Commission, Prince Bismarck's pet project, which was established in 1886 for the purpose of buying estates out of Polish hands in two of Prussia's Polish provinces—West Prussia and the Grand Duchy of Posen—presented to the Prussian Diet a memorial, or report, of its work for the year 1905. From the year of its creation to 1905, the Colonization Commission has acquired 1,144 square miles. For the purchase of this land, amounting to 5 per cent. of the two provinces, the Commission has expended \$67,592,000. The acquisitions of

the Commission comprise 446 large estates and 472 small estates or peasants' farms. Of the land purchased by the Government's Colonization Commission 66 per cent. was bought of Germans, while 34 per cent. was bought of Poles. The losses that the Polish community has suffered thru the sale of land by Poles to the Government's Commission are enormous; but in the last few years the sale of land by the Poles to the Commission has steadily decreased, while the purchase of land by the Poles from private Germans has as steadily increased; so that, according to the Governmental statistics, the Poles have, in the last few years, been acquiring, or rather regaining, more land than they have been losing. Notwithstanding this colonizing of Germans in the Polish provinces by the Government, the increase of the German population of the Grand Duchy of Posen from 1890 to 1900 was only  $3\frac{3}{4}$  per cent., while the increase of the Polish population was  $10\frac{1}{2}$  per cent. This is a condition that will not change in the future either; for, irrespective of the few thousands of colonists on the land acquired by the Colonization Commission, no Germans immigrate to the Polish provinces, and besides the Germans already living there, being tempted by the abnormally high prices of land in the Polish provinces (which have risen from 560 marks a hectare in 1886 to 1,184 marks a hectare in 1905), seek the opportunity to sell their estates and go with their augmented fortune to the neighboring German provinces, where land can be bought at from 200 to 400 marks less per hectare, deserting the provinces which it was the intention of the Government to Germanize. From the data quoted above it is apparent that Prince Bismarck's battering ram against Polonism, which at the outset was so terrible an engine, has ceased to be directly formidable to the Polish community. Notwithstanding that there are heard even from the ministerial bench and from the ranks of the most decided Agrarians voices expressing doubt of the efficiency of the policy of colonization, the Polonophobes will propose another appropriation of a hundred or more millions of marks for the same purpose.

# Henrik Ibsen

BY GEORGE BRANDES

[We are especially pleased to give our readers the following appreciation of Ibsen, who died last week, from the pen of the greatest Scandinavian critic, George Brandes. Among the thirty-three volumes of history, literature and criticism that he has published, perhaps the best known are "Main Currents of Literature of the Nineteenth Century," "Danish Poets," "William Shakespeare," "A Study of Ibsen" and "Ibsen and Bjornson." We follow this article with another on Ibsen by our literary editor, Dr. Slosson.—EDITOR.]

**A**S a rule it is a curse to the writer not to belong to a universal language. It is easier for a third-rate intelligence to gain favor in a widespread tongue than for a first-rate spirit to assert itself thru translations.

It is impossible to produce artistically in the strongest sense of the word except in one's own language. When an author is translated, it becomes apparent that frequently he will appeal to the sphere of knowledge and experience prevailing in the community in which he lives, and this may seem strange to the great society of the world.

If Henrik Ibsen has surmounted these difficulties, it may firstly be attributed to the fact that his modern plays are written in prose, in short firm sentences easy to translate, so that too much was not lost. Secondly, in developing himself he ceased more and more to write only for Scandinavia, but worked, keeping a universal public in view. This is, for instance, betrayed in such a little feature as his placing a castle like Rosmersholm in Norway, though such old castles are never found in his native country.

Finally, the reason is that he has made revolution in his branch of art. The most esteemed German dramatists before him, as Friedrich Hebbel, came to be looked upon as his mere forerunners. The French dramatists, who in his youth were masters in the European theaters became antiquated compared with his art. With them there is still an intrigue in an antiquated form. Some one is made to believe something and reacts. Since the artificial intrigue in Ibsen's youthful play, "Lady Inger," such plots never more occur with him. From within their characters are disclosed. A veil is lifted, and we notice the peculiar stamp of the personality. A second veil is lifted, and we learn its

past. A third veil is lifted, and we catch a glimpse of its profoundest nature. In all these leading characters there is a deeper perspective than with any other modern poet, and it is disclosed to us without subtlety. Technicalities are new; no monologs, no private speeches. We must exert ourselves to understand as we do in life.

Even the most original leading characters of the contemporary dramas had always been rather disunited. So vivid a figure as Giboyer, in *Augier*, is not even so complicated as was Rameau's nephew, by Diderot, in the eighteenth century.

Now make a comparison with "Solness." He has quite a swarm of individual features, and he presents the enthralling duplicity of being at once a universal symbol, the declining genius and an individual with hundreds of singularities.

This being so, it is impossible to write after Ibsen, as was written before him, if for the rest we are on a level with the best dramatical art. He has strung the claims of the characteristic and dramatical technics in a higher sense than was the case before him.

While some of the best of the Scandinavian scientists (as Tycho Brahe, Linné, Berzelius, Abel), and a single plastic artist (as Thorvaldsen), have highly asserted themselves outside their native country, only a few representatives of light literature have prevailed. In Germany and England, Tegnér is known on account of a series of romances, "Frithiof"; Hans Andersen is renowned for his Fairy Tales in Germanic and Slavic countries; I. P. Jacobsen has exercised an artistic influence in Germany and Austria. This is nearly all.

The literary fortune seems necessarily

to become unjust. Still perhaps the Danes have to complain only of one great injustice—that so profound and original a spirit as Søren Kierkegaard has remained unnoticed and uncomprehended.

By a particular detail this iniquity stood Henrik Ibsen in good stead, for Kierkegaard being unknown to Europe, Ibsen appeared the more peculiar and greater. His nearest intellectual forerunners being ignored, the highest culture of Scandinavia for the first time enters into the process of development of European literature. But certainly the point is not that some name or other becomes known—this has often occurred and does so every day, the more translations become general—but that the author practices an undoubted influence. For this is required a hardness and pungency of the individuality, diamond-like sparkling in facets. Only thus equipped the man will be able to scratch his name on the glassy surface of the age.

Twenty-five years ago Ibsen made Oswald in "Ghosts" exclaim: "Never to be able to work any more! Never—never! To be living dead! Mother, can you imagine anything so dreadful?" And now for six years this has fallen to his lot, while his fame is proceeding all over the new and the old world.

Apart from the juvenile dramas, turning upon legends and history, from the polemical plays "Love's Comedy," "Brand," "Peer Gynt," "The League of Youth," it is specially the twelve modern dramas from Ibsen's mature age upon which his universal fame rests.

Of these twelve six are polemics against society. They are: "The Pillars of Society," "A Doll's House," "Ghosts," "An Enemy of the People," "The Wild Duck," "Rosmersholm."

The last six are not polemic, but purely psychological. They treat mainly of the relations between man and woman, and in them women are the leading characters. They are: "The Lady from the Sea," "Hedda Gabler," "Solness," "Little Eyolf," "Borkman," "When We Dead Awake." They are family tragedies and individual tragedies, losing sight of the state community.

However, Ibsen has proved himself no less eminent as a leader of culture

than as a poet. And in order to render more apparent his importance it will be useful to compare him with other leaders of culture of the age.

The same year as Ibsen two great authors were born, Taine in France and Tolstoy in Russia. They have some few generic features in common.

Taine, like Ibsen, was in the beginning a rebellious spirit, and until his fortieth year he called forth a revolution within the intellectual life of France.

But as years advanced he more and more became, what Ibsen had been his whole grown up life, a hater of the revolution which levels and which forwards equality by slaying the prominent. The majority, so to say the spontaneous democracy, which, according to Ibsen's definition, always is in the wrong, is subject to his contempt, as well as to Taine's.

Taine is more conservative than Ibsen. His ideal is the English state of things. What Ibsen especially urges is the slight import of any doctrine of any kind. Alterations are not brought on by way of new doctrines, but because the individual itself undergoes a change.

In spite of his mental greatness, Tolstoy has a narrow intellect; he misjudges Taine and despises Ibsen, thinking the latter aims at being unintelligible. Nevertheless, he, like Ibsen, is a forerunner, a destroyer of social prejudices and a prophet of a new social order of things, independent of the state. They have the anarchical revolutionary bias in common. But while this tendency in Ibsen is combined with an aristocratic feeling, in Tolstoy it is merged in the faith in the necessity of accomplished equality. Tolstoy preaches evangelical love; Ibsen the autonomy of the individual.

There are essential features which Ibsen has in common with Renan, who was some years his senior and whom he perhaps has not even studied. When Ibsen says: "I only ask; my call is not to answer," this sentence is also applicable to the keen thinker and sceptic Renan. Both rouse the vital power; Renan by charming, Ibsen by frightening.

Count Prozor has pointed out the resemblance between the ideas of Ibsen's juvenile work, "Brand," and those of

Renan's likewise juvenile work, "Future Science."

While Brand announces that the Church has neither walls nor boundaries, the celestial vault being extended above it, the same idea is to be found in Renan, even the thought that the old Church is to be succeeded by a new and greater.

speaks of the superior man as the preliminary aim of the race long before he, as Zarathustra, prophesies of the superman (Uebermensch).

The radicalism of both is thoroly aristocratic. Now and then they meet in the psychological domain. Nietzsche loves life so intensely that even truth

Henrik Ibsen.

Copyright, 1906, by Underwood & Underwood, N. Y.

While Taine and Tolstoy are exactly of the same age as Ibsen, Renan a little older, there is still a greater, somewhat younger contemporary with whom Ibsen must be compared, tho he never read a line of him. This is Nietzsche.

Independent of one another, but like Renan, they have both discussed the idea of disciplining noble personalities. It is Rosmer's favorite idea, it becomes that of Dr. Stockmann. Thus Nietzsche

seems valuable to him only when life is taken in hand and preserved thru it. Falsehood is to him only so far a pernicious and demolishing power, as it is life restraining. It ceases to be pernicious when necessary for life.

Ibsen, who in his whole endeavor appears a worshipper of truth, is yet thru his development brought to a similar point of view. In "The Wild Duck," Dr. Relling speaks of necessary shams.

But as early as "Ghosts" Ibsen dwells upon the injustice of speaking the exact truth. Mr. Alving neither can nor will speak the truth to Oswald about his father. She shrinks from robbing him of his ideals. The ideals are here contrasted with truth.

Mrs. Borkman lives upon the vital lie in thinking that Erhart, the son, will become a man able to accomplish a great mission and to raise the honor of the house. The sister replies: "That is only what you are dreaming of, and if you had not that to cling to, you would certainly have enough to drive you to despair."

Borkman lives upon the vital lie that a deputation will come to offer him the direction of a great bank: "Don't you think that they will come? That they must come to me once? I believe it so firmly, know it for certain. If this certainly had not been so, I should long ago have blown out my brains."

In "The Epilogue," the sculptor Rubbeck asserts the importance of his work, saying: "When I had created this masterly work—for certainly 'The Day of Resurrection' is a masterly work! Or was from the beginning" . . . (he feels that he has spoilt it). "No, it is so still, shall, shall, shall remain a masterly work."

Lonely they have been, Ibsen and Nietzsche, and strong in their loneliness. Difficult is it to settle the question which Count Prozor has propounded, which of them was the most lonely. Still more difficult it is to decide to which of them we owe the profoundest and the most emphatical impression and by which of them fame will be the longest preserved.

In Scandinavia, Ibsen has enriched all of us; has, for one thing, influenced the dramatists, but without having founded a school.

In the eighties, Ibsen was appreciated in Germany, as the great naturalist (together with Zola and Tolstoy), when the idealism of Schiller was being criticised and the idealism of Ibsen overlooked. Owing to his revolutionary under-current ("The Pillars of Society") he ap-

peared a Socialist to the conservative; in consequence of his faith in the minority and the individual ("An Enemy of the People"), he seemed to the uniform German reading public an Individualist.

In the best German dramatists, as Gerhart Hauptmann, his influence is easily pointed out. "Before Sunrise" is influenced by "Ghosts," as well as by Tolstoy's "The Power of Darkness." "The Sunken Bell" recalls both "Brand" and "Solness."

In France, Ibsen was greeted as the great symbolist at the time when symbolism was the fashion. The mysticism in Ibsen, the white horses in "Rosmersholm," the stranger in "The Lady from the Sea," specially gained sympathy there. Frequently he was even looked upon as an anarchist. "An Enemy of the People" was applauded as a protest against State and society. At the court of justice, anarchists accused of having thrown shells, even mentioned his name among their leaders. Technically, he influenced several of the modern dramatists, as François de Curel.

In England, where Ibsen has only influenced a narrower circle, and where his name is known without being popular, he has gained the favor of criticism; Edmond Gosse and William Archer having praised him in fine words, and among the dramatists he has influenced Bernard Shaw, thus having contributed to the development of this remarkably queer fellow. There he has been glorified as a psychologist and attacked as a supposed materialist.

No better witness is borne to the man's greatness than the fact, that in Norway he has first been looked upon as conservative, then as a radical; in Germany, as a symbolist and anarchist; in England, scoffed as incomprehensible and glorified as profound, while North America has paid full tribute to him.

In every country only some few sides of his entity have generally been kept in view. This proves in how numerous facets it is sparkling and how many-sided it is.

COPENHAGEN, DENMARK.

# Ibsen as an Interpreter of American Life

BY EDWIN E. SLOSSON

**I**BSEN'S chief characteristics are modernity and universality. He renounced romanticism in order that he might devote himself to present day problems, and, as a social mathematician, discover the greatest common factors of all humanity. If he had continued as he began, writing plays of Norse kings and Roman emperors, with gorgeous scenes and troops of retainers, he would have been merely a Norwegian dramatist; but when he widened his scope by narrowing his field to a half dozen middle class men and women in a cheaply furnished room of a Norwegian town, he became a world dramatist. The stage of almost every other country has been more influenced by him during the last quarter century than by any of its native writers. In Germany, Hauptmann and Sudermann; in France, Hervieu and Brieux; in England, Pinero and Shaw, have gone to school to Ibsen, and have so far profited by their lessons as to reach a wider public than their master could.

In America, Ibsen has exerted no such influence, because there are no such dramatists to be influenced. The thought of Clyde Fitch, Augustus Thomas, or George Ade being influenced by anybody, or influencing anybody excites a smile. Our American playwrights are taken seriously neither by the public nor by themselves. We have no cause to find fault with them. They give us what we want and we pay them well for it.

An American Ibsen would starve. The Norwegian Ibsen came near it. But, as he says, thru the mouth of Dr. Stockmann, "the strongest man in the world is he who stands most alone." Ibsen, single handed and under the ban, conquered a place in the world's esteem which he could never have obtained if he had been hampered by a train of friends, allies and disciples. In his old age his own people received him again, and now he is dead shower upon him the praise and honor which, if he had received them in his prime, would have cheered his heart and spoiled his

work. If he had come by his opinions easily he would not have believed them so strongly. If they had been accepted readily, he would not have stated them so forcibly.

Ibsen was able to break thru the barrier of language, because his characters are universal types and at the same time very definite individuals. When the scientist speaks the name of a species he does not mean the platonic ideal, perfect and non-existent; he means one particular plant, fish or fossil on a certain shelf in the British Museum or elsewhere. This is the type specimen, and it is of interest because in many parts of the world are found other specimens resembling it more or less closely in different ways. So Borkman and Stockmann, Nora and Hilda were first discovered by Ibsen in Norway, but the same species are found in all countries, and nowhere more abundantly than in America.

John Gabriel Borkman, for example, has never appeared in America on the stage, but he is well known on the street. He is the typical financier of the kind who are now being pilloried in the market place by official and unofficial investigators. He is a Napoleon of finance, but crippled in his first engagement. On the eve of success, just as he is about to carry out his gigantic schemes, he is caught in a bit of financial juggling, and sent to prison for five years. After his release he shuts himself up in the upper room of his house for eight years waiting for his vindication, pacing the floor day after day expecting those who have betrayed and wronged him to come to him there in his room and on bended knees beg him to return to the management of the bank. He thinks no one can take his place, tho in reality the business world has forgotten him.

He admits the technical illegality of his act, but cannot understand why people should make such a fuss about a little thing like that, cannot believe that they are sincere in condemning it.

"I had almost reached my aim. If I had had a week more everything would have been in order. All the deposits would have been

turned in. All the securities that I had boldly made use of would have been again laid in their places just as before. Not a single person would have lost a penny. And then to be struck in the back by a traitor! What I could have done with the millions! All the mines that I would have opened! New shafts without end! The waterfalls! The bridges! Railroads and steamship lines thru the whole world."

He hears the ore calling to him from under the ground, singing for joy; the kobolds, guardians of the hidden treasure, waiting for the stroke of the hammer, like the midnight bell, to release them, and let them get at their work, the service of mankind.

"I had the power. There lay the imprisoned millions everywhere in the depths of the mountains and called to me, cried to me for deliverance! But no one else heard. Only I, alone.

"I would like to know if the others, if they had had the power, would not have done exactly as I did.

"They would have if they had possessed my ability. But if they had done it they would not have done it with *my* object in view. The action would then have been a different one. In short, I have acquitted myself."

He had sacrificed his love, his family and himself to his commercial aim, but this, he insisted, was not a selfish aim. He did not want money or luxury or ease; he wanted to set the wheels going, to free the kobolds of the metals from their idle prison life. Consequently he cannot repent his act; he can only regret that the world has robbed itself of what he alone could do for it. In this we hear again the dying lament of Cecil Rhodes: "So little time, so much to do." He is the modern financier, with nothing extenuated and naught set down in malice.

Ibsen's "Pillars of Society" is a dramatized insurance and Slocum scandal. Consul Bernick, as he stands at the door of his home receiving the homage of his fellow townsmen and listening to the eulogy of Pastor Rörhund on the purity of his family life, the generosity he shows to his workmen, the public spirit manifested in his business enterprises, and the unselfishness and probity of his character, realizes that it is all a lie. He knows, and he knows that there are others who know, that he has for years concealed an immoral life, that his workmen are being discharged without mercy to be replaced by machines, that he has bought up all the land along the railroad he is being praised for bringing to the

town, and that the ship which is then leaving the harbor is so imperfectly repaired that it is sure to sink in a storm. He has sacrificed everything and everybody to build up a good reputation, to be called, as he is now, the ideal citizen, but at this moment he realizes the extent and meanness of his hypocrisy, he tears off the veil from his life, and exposes to the gaze of the crowd the moral rottenness of the pillars of society.

"But what good came of it at last?"

Quoth little Peterkin,

"Why, that I cannot tell," said he;

"But 'twas a famous victory."

This verse of Southey's might be placed as a tag to this and all the rest of Ibsen's plays. They are famous victories of self assertion over the oppression of society, and of naked truth over conventional shams, but the outcome of these outbursts of individuality and honesty Ibsen does not explain. Ibsen's curtains always fall at the most interesting point, and he does not write sequels.

According to his theory of ethics, virtue consists in daring to do what one individually believes is right, even tho the consequences be disastrous, and, in his plays, they usually are. The individual is killed or is ruined at the moment he triumphs by the assertion of his will. Ibsen offers no reward for good conduct, not even a hero medal.

Dr. Stockmann is under the common delusion that he will be greeted as a public benefactor if he exposes the faults of the society in which he lives. When he finds that the water of the Baths, on which the prosperity of his native town is built, is contaminated with disease germs and the whole system of sewer pipes must be relaid at great expense, he feels that he has deserved well of his fellow citizens, and he ingenuously suggests to his friends that he hopes they will not get up a public demonstration and a torchlight procession in his honor. When he finds that his exposé is to be suppressed by the town authorities, he turns to the Liberal press, only to find that Liberals are just as illiberal as Conservatives when their interests are touched, and, finally, when he appeals to the common people, he is ostracized and stoned. Ibsen wrote this play, "The Enemy of the People," as a reply to the

storm of denunciation which greeted his exposure of conventional shams in "The Pillars of Society."

The present time would be a good opportunity to have "The Enemy of the People" produced upon the American stage. Possibly a company of actors for this play could be made up from those writers who have been contributing to the literature of exposure, but who now find no demand for their wares since the reaction against muck-rakers has set in. They might get as much satisfaction in playing it as Ibsen got in writing it.

The question of tainted money is treated in "Ghosts" as part of the general bad inheritance of Oswald. Mrs. Alving devotes all of Captain Alving's money to the building of an orphanage as an atonement for his sins and to free their son Oswald from their sequelæ. But "Captain Alving's Home" burns down on the eve of its dedication, and Oswald perishes likewise from the tainted blood in his veins. Mrs. Alving, with all her courage and determination, is not able to free herself and her son from the "ghosts" of the past.

"I almost think we are all of us ghosts. It is not only what we have inherited from our father and mother that walks in us. It is all sorts of dead ideas and old lifeless beliefs, and so forth. They have no vitality, but they cling to us all the same and we can't get rid of them. Whenever I take up a newspaper I seem to see ghosts gliding between the lines. There must be ghosts all the country over, as thick as the sands of the sea. And because we are, one and all, so pitifully afraid of the light."

Ibsen is a disillusioned democrat. He is aware that tyrants do not all perish when the kings are slain. Norwegians are not afraid of kings. They discharge them and elect them at their will. But they are not a free people as Ibsen is always pointing out. The tyranny of tradition, the tyranny of conventionality, the tyranny of public opinion are the objects of his sharpest invective.

"The majority has might—unhappily, but right it has not. The minority is always right. . . . I am going to revolt against the lie that truth resides with the majority. What sort of truths are those that the majority is wont to take up? Truths so full of years that they are decrepit. When a truth is as old as that it is in a fair way to become a lie. . . . You may believe me or not, but truths are by no means the wiry Methuselahs as some people think. A normally constituted

truth lives—let me say—seventeen or eighteen years, at the outside twenty years, seldom longer. But truths so stricken in years are always shockingly thin."

Since "The Enemy of the People," from which these words are quoted, was written, in 1881, it might be said that all the truth it may have contained lost its validity some five years ago. But it is obvious that he applies this statute of limitation only to truths that are so far accepted as to become conventionalized. Ibsen followers are few in any land, and his doctrines will long preserve their vitality by being safely kept in hands of a very small minority.

In this country, especially, where some of the plays are never seen and rarely read, the ideas of Ibsen have the freshness and interest that they had when they first startled Europe. And nowhere is their galvanic shock more needed than here. His mission is to rouse people from self complacency and stolid satisfaction with things as they are. Even more than Norway, America lies apart from the great currents of modern thought, and there are eddies of provincialism to be found in all parts of the United States that would match anything of the kind in Scandinavia. Ibsen describes our small towns better than our own writers. The vices of the village, its narrow interests, its gossip, its exclusiveness, and its rigid control of the conduct and opinions of the individual, are the same here as in Norway, and need the same drastic exposure. We are all acquainted with Peter the pompous burgomaster, with Mortensgard, the free-thinker, who turns out to be neither free nor a thinker; Aslaksen, the moderate man, whose heart belongs to the people, but whose reason inclines to the authorities; Hovstad, the printer, whose paper is radical on questions of national politics, but observes a certain amount of caution in regard to purely local matters; Solness, the master builder, losing his grip on his work and in mortal terror of being supplanted by the younger generation; and Tesman, the professor, physically and mentally near-sighted. As for Ibsen's women, we have them all here, from Nora, the bird-woman, to Hedda, the cat-woman. There is need in America for this Ibsen, layer of ghosts and pricker of bubbles.

Alphonso XIII.

Princess Ena of Battenberg.

## The Spanish Royal Marriage

BY JOSÉ GAYA Y BUSQUETS

[The King of Spain is to be married today to Princess Ena, and we are accordingly glad to give our readers the following article from a regular contributor to several of the leading Spanish newspapers and periodicals, and a graduate of Barcelona University, where he taught for some time:—EDITOR.]

**T**HO this Spanish royal wedding has its political and international bearings, it is the personality of the youthful king that dominates the whole event. Even the individuality of the girl Queen, because of her tender years and the rather retired life which she has heretofore led, is also pushed into the background by the prominent figure of the husband. So what is said in the following paragraphs will be almost exclusively confined to Alphonso XIII, and particularly to his personal traits, for he has not had time yet to make a mark in public and political affairs, tho the day is surely coming when he will do so. There is much of the Kaiser in this royal youth, as time will prove.

Since May 17th, 1902, when Alphonso

XIII became the effective head of the State and was declared of age, he has been busy completing his general education. He has especially visited every corner of his own country, "so that I may myself know," he said recently to a high official, "what is good and what is bad, how and where improvements can be made." He has still further increased his fund of information by foreign travel, when all his attention has not been confined to the official calls and banquets which monopolize so much time during journeys of this kind; but he has been able to devote a large share of his free moments to noting wherein what he saw could benefit the state of things in his own Spain, which he loves with an ardent pride, never forgetting that he is sitting

on one of the most ancient thrones of Europe.

Now he is going to make himself a complete king by his marriage, and henceforth will devote himself more closely to the interests of the Spanish people, pushing more behind him his inordinate love of sports which have heretofore claimed so much of his time and attention. Tho he will not abandon his automobile—in fact, he has just ordered a brand new one—he will give more and more attention to politics and public affairs. This statement has been made by several persons very close to the throne, and has been repeated frequently of late by the queen mother, who has not been always satisfied with the way her son, during the past few years, “has run wild over sports.” Already he has learned that a king in a free land like Spain is subject to the demands of public opinion, and has accepted without impatience more than one criticism and even censure of certain of his acts and remarks. In one quarter he has heard himself called too democratic, while in another he is pronounced “a little autocrat.” Both of these judgments are extreme.

The truth is that Alphonso XIII, light-hearted boy tho he be, perfectly understands the *rôle* of a constitutional monarch of the twentieth century, who cannot be too democratic nor too little autocratic.

The life and surroundings of the young King from the day of his birth and the influences of family traditions throw a flood of light on his personal character, explain many of his sentiments and give the true color to most of his public acts, past and present. So in order to get an exact portrait of Alphonso XIII we should go back a little into his short past.

The great-grandfather and the great-grandmother of the present king were Ferdinand and Maria Cristina, who ruled in Spain during the stormy period extending from 1808 to 1833. They had two daughters, the eldest being Isabella, grandmother of our king, and she became Queen at the early age of twelve, in 1833, ruling till 1868, in the midst of much strife, occasioned chiefly by Don Carlos, brother of Isabella's father, who claimed that the throne, because of the Salic law, should have come to him.

The Royal Palace, Madrid.

Isabella was finally driven from Spain and henceforth resided in Paris, where she died only a short time ago. From 1870 to 1874 Spain passed thru a most stormy period—provisional governments, regencies, an ephemeral monarchy, thirteen months of republic, with three or four presidents—when, in December, 1874, the son of Isabella, father of the present King, mounted the throne, and since then a more or less quiet period has followed.

It will thus be seen that the young King of today has not to go far back into the past to find striking examples of bad government in his own country, of civil discord and of all the evils arising from a lack of cordial and intelligent union between throne and people. That Alphonso XIII has ever these sad recollections before him and that he is earnestly determined to do all in his power to prevent their recurrence is a fact well known to all those who approach him.

In 1878 Alphonso XII married his cousin, who died the same year without leaving an heir. Then the king wedded the present Queen-mother, who bore him three children, two princesses, one of whom is still living, and a prince, the present King, who was born on May 17th, 1886, several months after the death of his father. The difficulties attending this giving an heir to Spain, and the many anxieties which it occasioned in the political and business world of the country, were some of the potent reasons which urged the young monarch to an early marriage, a good instance of how he is influenced by the lessons of the past.

Another fact connected with his birth has always had a strong effect on the acts of Alphonso XIII. He was proclaimed King of Spain at the moment of his birth, European history mentioning only one other example of this kind, if I am not mistaken—that of John I of France, who, however, lived but a few days. Thus, tho Alphonso XIII is still but a boy, he does not forget that he has been a king since birth. "I have been crowned for the past twenty years," he is accustomed to say, "and so I should know my duties; and when one should know something, one must know it, especially if one chances to be a king." So

Alphonso XIII feels that his youth is no excuse for faults, since he is King since 1886!

Still another fact has an influence in this same way. His father being dead, the greatest concern was felt about the birth of the expected heir. The sex of the future child and the possible accidents attending its advent into the world kept the public in a fever. "A great cyclone was sweeping over the land" is the expression that has been used to picture the state of things in Spain at this moment. "Well," the King said not long ago, referring to this period, "where so much was expected it would be cruel to give disappointment, which is another reason why I must not fail to bestow on the nation all that it is in my power to bestow."

A fourth cause arising from his peculiar birth has also had much to do with the molding of Alphonso's character. From his coming into the world up to May 17, 1902, his mother acted as regent. This government of a woman, holding in trust a crown for her only son, a widow anxious for the future of a fatherless boy, appealed to the respect of all parties and won this respect during a period of some seventeen years, which was marked by more than one storm and grave danger to the dynasty and the peace of the country. "What my mother has been able to accomplish I should be able to accomplish," said this dutiful son to a foreign diplomat on one occasion this past winter; "if my government falls short of hers I will show myself an unworthy son, and I will have all the friends of the New Woman against me, too," he added, with a smile.

So the birthday of Alphonso was indeed an historic moment for modern Spain. When the baby came into the world, the Infanta Isabella presented him to the venerable Señor Sagasta, then Prime Minister, who, turning toward those present in the antechamber of the Queen, exclaimed, as the lace covering was removed from the naked body of the child: "Long live the King!" Then the Nuncio of the Pope came forward in his turn, and raising his hand as if to bestow a blessing, repeated: "Long live the King!" Next the babe, who now began to cry vigorously, was carried back to his

happy mother, and a regular birth certificate was drawn up by the Minister of Justice and signed by a half dozen of the dignitaries present.

The question of naming the infant was not easily settled. His father, before dying, openly expressed the wish that if the child were a boy, he be called Ferdinand. But when the father was dead and the baby was born, the Queen-mother, in whom sentiment and learning are equally mingled, pronounced for Alphonso, in memory of "the dear dead husband and loving parent";

and when the ministers pointed out that XIII. would be the numeral that must follow the name if Alphonso were chosen—an unlucky number the world over—the well read Regent called their attention to the fact that the Alphonsoes of Spanish history were "all good and wise," and that it would surely be of good augury to give her son this name, "which, in the list of Spanish sovereigns, was always followed by such glorious qualifications as

the Catholic, the Good, the Noble, the Great, the Learned, the Just, the Pacificator, etc." And when this princess of foreign origin related the history of each of these appellations, going deeply into the history of the Spanish nation, a strong impression was made on the listening and admiring ministers. But the Cabinet did not arrive at a prompt decision, and, in the meanwhile, the opposition in the Cortes took up the matter. During the discussion, Señor Cánovas, leader of the Conservative party, made a suggestion which attracted wide attention. "Why not call the young King Don Carlos?" he asked,

and then added maliciously; "When the Carlists would thus have before them two Carloses, they would surely go over in a body to the one whose title was fresher and more legal than that of the exiled chief." But in the end the view advocated by the Queen-mother prevailed, and the new monarch became Alphonso XIII.

But Alphonso is not the King's only name. He has half a dozen others, all given him for a good reason. Thus he is Alphonso in memory of his father, as

I have already said; he bears the name of Leo because of the Pope Leo XIII, who was his godfather; Ferdinand, the appellation chosen by his father; Marie because he is "consecrated to the Virgin"; James, in honor of the patron saint of Spain; Isidore, in order to secure "the celestial protection" of the saint of this name, who is the patron of Madrid; Pascal, because May 17th, the birthday of the King, is sacred to this holy man, and lastly, Antoine, in order to recall the name of the

The New Queen of Spain when a Child.

tender apostle sprung from the royal family of Spain.

After what has been so far said, it will astonish none of your readers to be told that Alphonso is very pious. It would be difficult for a Spanish king to be the contrary, especially one brought up as this one has been brought up. In the first place, his mother is a fervent Catholic, and the child has been in her keeping since his birth.

We have seen that the representative of the Pope played a part at the very first breath of the babe, and from that day to this the Church has kept her hand upon him. Five days after his com-

ing into the world the baby King was baptized with great ceremony. Six weeks later, when he went out for the first time, the Church again celebrated the event. The royal mother, attired in her long black mantle of widowhood, carried her infant to the Church of Nuestra Señora de Atocha, and after the Te Deum she lifted him aloft in her arms and offered him to the miraculous effigy of the Black Virgin, the patron saint of Madrid and the protectress of the Spanish royal family. Thus was the infant King consecrated to the Queen of Heaven, for whom his ancestors had always fought the battles of earth. And from then on, thru his short life up to the present, has the existence of Alphonso XIII been continually connected with the Church in many and different way. He is indeed a child of Rome, and hence it is that not a few enlightened Englishmen have not hesitated, especially in the early stages of the present match, to protest, even in print and in the stately columns of the *London Times*, against joining to so pronounced a Catholic in marriage a fair Protestant princess, forced to renounce the religion of her ancestors and to enter into a Church which so many of her countrymen and countrywomen abhor.

But a king, even a Spanish one, cannot be a monk alone. He must be something of a politician also. So in October, 1887, the baby monarch presided for the first time at the opening of the Spanish Parliament, and since he has reached years of discretion, Alphonso XIII takes deeper and deeper interest in questions of a political nature. On this occasion the royal party made their entrance into the Cortes to the sound of the Spanish national march, the King being carried by his nurse. While the Queen-mother stood reading the address the child had his eyes riveted upon her, as if he understood everything that was being said. Even at this early age Alphonso seemed to enjoy public ceremonies, for which he now has a perfect passion. One day when he was two years old there was consternation at the palace because the child had disappeared and nobody could tell where. But he was finally discovered on a balcony, throwing kisses to the cheering crowd, and it was no easy thing

to tear him away from what was evidently affording him great amusement.

The popular eagerness to see the King, when he was a child, was often intense. Thus, on May 20th, 1888, when the international exhibition at Barcelona was opened, the little King, going from the station to the City Hall in an open carriage, was so showered by flowers that the nurse opened an umbrella in order to protect him, much to the displeasure of the Queen-mother, who feared the people might be offended. It was on this occasion that she turned to one of the ladies in the carriage with her and said: "If nothing worse than flowers were thrown at us we would never have to complain!"

Another great event in the young ruler's life was getting an equestrian photograph of him. It is the custom in Spain to put on sale everywhere the portrait of the sovereign on horseback. To many Spaniards there can be no King of Spain unless he is seen sitting on a horse. So when he was twenty months old Alphonso was photographed on a steed, but the animal was really made of pasteboard. But since those days the King has made great progress in equestrianism, and at present he is one of the finest riders among the crowned heads of Europe. When he was in Paris last year he visited the military school of St. Cyr. The authorities of the French West Point made a great pother over finding a gentle horse for the King to use at the review, lest a too spirited animal might be the cause of some accident. When a former military attaché at the French Embassy at Madrid saw the horse that had been chosen, he exclaimed: "Why, if you put the King on that nag it will remind him of his first equestrian portrait!" So a fine Arab steed was produced and Alphonso mounted him to perfection.

Quidnuncs see one possible cloud on the domestic horizon of the royal household. The King has the warmest attachment for his mother, who, in turn, worships her boy; and as, during the regency, she was in the habit of commanding him, the question is asked whether Queen Ena is not going to find here a source of conflict and eventual unhappiness. *Qui vivra, verra.*

A few closing remarks about some of the other accomplishments of the King, which have not already been touched upon here, and first among them, his wonderful memory for names and faces, in which respect I am reminded by an American friend he resembles the late Mr. Blaine. "If I see a person once," he has remarked, "I always recognize him, no matter when or where." Persons standing near the throne at the time of the Queen-mother's receptions, when she was regent, report that they often

become really the ruling monarch. He got up one morning very early, hastened to one of the barracks and routed out a whole regiment, placed himself at its head and went marching about the streets of Madrid. Nobody, not even the Minister of War, was informed of what he intended doing, and public opinion condemned the act very severely.

His favorite dress is a military uniform. He speaks a fine Spanish and is quite at home in French, English and German. He is skilled in military drill.

Entrance to the Bull-Ring, Madrid.

heard the boy-king whisper in his mother's ear the name and titles of all those who filed by.

The King has a strong will of his own. He likes to command. This characteristic showed itself when he was very young. When he was but eight years old, one of the near friends of the court addressed him as Rubi, the mother's pet name for her son, whereupon the little Alphonso replied quickly: "I am Rubi for mamma, but for others I am the King!" The same tendency showed itself in one of his first acts when he had

He is clever in all kinds of sport; can ride a bicycle, swim, drive and shoot. In music he can play the piano and violin. Among the many subjects which he has studied may be mentioned agriculture. "I am one of the most ambitious gentlemen farmers of Spain," he said not long ago. He never wearies of the hunt. At one time during his early youth almost his only amusement for a period was shooting in the wood near the palace, which was well stocked with game. But he finally got tired of this sameness, and said to one of his boy companions, "Well,

"If I am ever called anything, it will be Alphonso, the Rabbit Hunter."

King Alphonso is a famous automobilist. He can never go too fast, and this passion for speeding is a continual source of anxiety not only to his mother, but to the Cabinet Minister. Last winter he did his courting by automobile. He was in San Sebastian and his sweetheart in Biarritz. He was continually running between the two places and taking the Princess over all the surrounding country. But the mother and the ministers were less concerned then, for they felt sure he would not risk the life of the future Queen. They did kill one day an ass belonging to a peasant. But the King was in good humor, and, as he paid for

the animal, exclaimed: "Would that this were the last ass in Spain!"

Gaiety is in fact one of the prevailing moods of this happy young King. Many are the stories that are told of him which illustrate this side of his nature. The day after he and President Loubet were nearly killed by an anarchist's bomb, he said at the Elysée dinner, when the dessert was brought on: "Why, here is another bomb!"—*bombe* being the French name for a kind of ice cream. When he was shown, in London, the other day, a portrait of Mary Tudor, he declared that "If the princess I am going to marry looked like that, why, I simply wouldn't marry her!"

MADRID, SPAIN.

## The Plenary Assembly of the Bishops of France

BY THE REV. J. R. SLATTERY

[Since resigning his position as the head of an American Catholic order for the benefit of negroes, Father Slattery has spent much of his time in Europe, in the study of ecclesiastical affairs.—EDITOR.]

AT this moment, in Paris, are gathered the Bishops of France. The summons went forth from the See-house of Paris on April 17th, and the date of the meeting fixed for May 30th.

When the American bishops gathered in Baltimore in 1866 and 1884, they were known, officially, as The Plenary Councils (II. and III.). Rome, however, objected to the name "Council," as well as "National," for both savor too much of Gallicanism, hence the title which heads this paper. About the same number—eighty—are together in Paris, as were in Baltimore, twenty-two years ago.

These, however, include not the coadjutors of Paris, Lyons and Cambrai, or the hierarchy of Algiers or other French colonies. Upon the Seine today are seen the Prelates of the Concordat, with the fourteen consecrated by Pius X a few months ago. These two facts—the Assembly and the non-Concordat bishops—bear unimpeachable evidence that the Vatican acknowledges the dis-

establishment of the Church in France. For did Pius X. hold that the Concordat is still valid, he would not have committed himself to such a course, unless we choose to follow the erratic teaching of those Canonists, who hold the Pope is above all contracts or concordats, whether signed by him or not. These two parties in the Episcopate promise anything but accord, for the fourteen, forgetful that they all held posts under the Concordat, have been overzealous and have offended the others. A new Holy Spirit took possession of them under the dome of St. Peter's. Again, the letter of twenty-three prominent laymen to the Episcopate anticipatory of this Assembly, has become a brand of discord. Many bishops—specially the ultramontanes—took the proffered advice badly; while Brunetière, one of the master spirits, suffers a fresh affront in seeing a work which he published in his *Revue des Deux Mondes*, put upon the Index, viz., Fogazzaro's "*Il Santo*." Still a fresh sign

of discord is seen in the way that some bishops allow the prayer—"Domine, Salvam"—to be said or chanted at the parochial masses, while others forbid it.

In spite, however, of such and many other drawbacks the French bishops allow themselves only two or three days for the Assembly. It follows the general elections of this month. But, as on May 27th, the Carmelites of Campeigne were beatified in Rome, which many attended, and as next Sunday, June 3d, is Pentecost, when the bishops should be present in their respective cathedrals, little time is left; so little in fact that it looks as if they will only have to sign their names. The program, of course, comes from Rome; which, however, had named some time ago a commission of six to prepare the *schema*, among whom was Archbishop Mignon, of Albi—Loisy's friend and patron.

Among the subjects of discussion it is hard to see how Loisyism can be ignored. Rome may call upon the Assembly to condemn it, thus safeguarding itself and the congregation and avoiding the Galileo scandal.

The school question is very serious. In many places priests are treating the children attending the public schools as pariahs, making them sit apart in church, keeping them distinct in processions, frowning upon their parents. All this was very common in the United States and is yet done in some places. But Satolli condemned it in his fourteen propositions, imposed upon the American hierarchy in 1892 or thereabouts.

The training and support of the clergy again is a vexed question. Vocations are alarmingly few in France, the seminaries receiving fewer and fewer year after year. The Italian method of creating a clergy may be invoked by taking mere children from seven or eight and setting them apart in apostolic schools till ready for the seminary. As to the support the bishops seem at sea. The bishop of Moulin has made a schedule of tax per family, which he promises to modify year by year. The bishop of Meude has taxed his diocese one franc per head annually, not merely the wage-earners, but all heads. He, however, suggested that every pastor name a committee of laymen, three or less, who will look after

the collection and modify the tax, so as not to worry the poor. On the other hand, the bishop of Agen leaves it free to his people to provide by voluntary contributions. Still another, the bishop of Angers, has formulated a sliding scale according to income. It is clear that the French hierarchy are not in accord as to the *denier*, and the assembly probably will hit upon some plan.

It will not, however, touch upon the pensions, offered by the Government in the law of disestablishment. Rome has settled that. The bishop of Beauvais officially forbade his clergy to apply for the pensions. Rome made him withdraw this prohibition on the ground that after all the pensions were mere restitution. Six bishops and two archbishops applied formally for their pensions. When we remember that the highest pension is \$300 we must appreciate the poverty—to use no stronger term—of these wearers of the purple. Up to April 1st 20,000 priests had applied. To realize how many in proportion they are we must add that only a small minority of the priesthood of France are entitled to a pension; only those who held posts under the Concordat. Probably very few will neglect the pension.

Perhaps, too, the dress of the clergy may be discussed. Under the Concordat it was forbidden for a layman to wear the soutane or clerical hat. Now it is different. An enterprising firm of bill posters dressed its workmen in soutane and thus sent them forth. The people, however, resented this and the garb was dropped. The clergy, too, may drop the cassock for street wear and dress like their brethren in Germany, England or the United States.

Still a fresh question is marriage. Under the Concordat civil marriage always preceded the blessing of the church. Now, after the disestablishment, the opinion has been advanced that the church ceremony should proceed the civil. One pastor attempted it, but was promptly condemned by the local court. No doubt the whole question of the impediment of clandestinity created by the Council of Trent is pretty sure to come up either in the Assembly or afterward. Those of us who are familiar with the marital relations among the Filipinos

will realize how such matters stand in France. The days of Trent knew nothing of large cities with their factories or of the migrations of modern days.

Far and wide reaching indeed will be the effects of the disestablishment in France. It, no doubt, has sounded the death knell of Papal nunciatures. Austria, Belgium, Bavaria, Portugal, Spain as the greater nunciatures will soon follow. The system may survive in the modified form, now in Washington, and known as the Apostolic Delegation. Originally a court of appeal, it has taken upon itself one function after another until now it is, to all intents and purposes, the American Vatican. The lib-

eral party in the American Church were its founders. It was a bad blunder and well have they paid for it. Today the Delegation overlaps the whole American hierarchy, whose canonical rights are very little known even to the bishops themselves. But in France, the tradition of ages, which Rome so loves to appeal to, stands behind the French episcopate. To the future remains the outcome. The Gallican Church may once again rise. With the growth of the national spirit may come that return to original types, which history, like nature, loves to repeat, and the Papacy dwindle into the Patriarchate of Italy as in the days of Leo the Great.

PARIS, FRANCE.

## The Development of Porto Rico

BY BEEKMAN WINTHROP, LL.B.

[Governor Winthrop of Porto Rico was born in 1874, and graduated from Harvard in 1897. From 1900 to 1901 he was private secretary to Governor Taft in the Philippines. In 1903 he was appointed Judge of the Court of First Instance in the Philippines, and in July, 1904, was promoted to the Governorship of Porto Rico. With the publication of this article every Governor of Cuba, Porto Rico, the Philippines, Hawaii, Guam and Samoa, from the time of American occupation to the present, has contributed an article to THE INDEPENDENT.—EDITOR.]

THE many novel and interesting problems of government continually arising in the Philippine Islands have, to a considerable extent, overshadowed in the public mind the affairs of our smaller tropical possession in the West Indies, the beautiful and fertile island of Porto Rico, acquired by the same Treaty of Paris. There are here no picturesque and uncivilized Moros or Igorrotes to attract attention, and no peculiar Oriental atmosphere to stimulate the imagination. In many other ways, however, Porto Rico is of very considerable interest to us. It was on this island that Columbus landed on his second voyage to America, in 1493. San Juan, the capital of the island, founded more than a century before the Pilgrims arrived in Massachusetts, is the oldest city in the United States. Some of its most important houses, still occupied, were begun years before there was any white settlement on the con-

tinental of the United States, and in certain localities traces of the original inhabitants of the island are to be found in the quaintly inscribed rocks and carved stone images that are discovered from time to time. Although no full blooded Indians have survived, the sharp features and high cheek bones of a few of the inhabitants of the interior bear evidence of Indian ancestry. The greater part of the inhabitants are of Spanish origin; the percentage of African blood being far less than in the neighboring Danish Islands, of St. Thomas and St. Croix, the English Island of Jamaica, or in the Republic of Santo Domingo.

For eighteen months after Porto Rico had passed to the United States, the government was conducted by officers of the United States Army, under the direction of the War Department. The form of civil government which succeeded the military administration on

May 1, 1900, provided for a Governor and Upper House of the Legislature, appointed by the President of the United States, and a Lower House, elected by the people of the island. The Upper House, or Executive Council, consists of eleven members, of whom six have additional

by the Governor of the Island, seven are natives, while of the twenty-four elective Municipal Judges, twenty-three are natives. Furthermore, the sixty-three Justices of the Peace have, without exception, been selected from Porto Ricans. It will thus be seen that of the one hun-

Beekman Winthrop.

duties as heads of executive departments of the Government. The Lower House, or House of Delegates, is composed of thirty-five representatives, five being elected from each of the seven districts of the island. There are five members of the Supreme Court, appointed by the President, three of whom, including the Chief Justice, are Porto Ricans. Of the eight District Judges, who are appointed

dred Judges in the island, but four have been chosen from other portions of the United States. It is a great pleasure to add that in general the personnel of the courts consists of a fine, honorable body of men, which has gained the confidence and respect of all. Since the organization of the civil Government, codes of civil and criminal procedure, a penal code, and a law of evidence, all based

upon the better statutes in force in the various States, have been adopted with great success.

A complete autonomous form of government has been conferred upon the municipalities. The mayors and municipal councillors of the various towns are elected biennially, and are entrusted with the duty of making all local ordinances. The general improvement shown in the administration of the majority of the municipalities in the past few years permitted the last legislative assembly to revoke the authority formerly conferred upon the Secretary of Porto Rico to review municipal ordinances, and to provide for an appeal to the courts of justice instead. This provision was received with great enthusiasm by the entire island as a proper recognition of the steady advance shown in the ability of the Porto Ricans to cope with questions of municipal administration.

To the average traveler in Porto Rico, probably the most noticeable features of American occupation are the public school houses, the excellent roads, and the efforts of the Government to stamp out the disease known as uncinaria or tropical anemia. During the last seven and a half years sixty-two school houses have been built—a considerable number when one considers that none were constructed prior to that period. Since 1898 the number of children under instruction in the public schools has been doubled, and a corresponding increase has been made in the teachers employed and the schools maintained.\* Unfortunately, in spite of the fact that more than 25 per cent. of Porto Rico's income is devoted to school purposes, the resources are still too small to permit the maintenance of a number of public schools sufficient for the needs of the island. For the present, every effort is being made to extend elementary instruction in the rural districts, rather than to increase the facilities now existing for higher education in the cities.

The Legislature has wisely considered that in view of the limited funds at its

disposal it was more desirable that a large number of children should receive elementary instruction, than that a few should be made proficient in classics or literature. High schools exist in some of the more important cities, and an excellent normal school is being conducted in San Juan. Practical training in agriculture and in the various trades is also provided, and hopes are entertained that this feature of the educational system can be extended in the near future. The Porto Rican child is anxious and quick to learn, and the eagerness of the people for education is an assurance that before long the percentage of illiteracy will be considerably reduced. Instruction in English is given in all the large schools to the Porto Rican teachers as well as to the pupils, and special prizes are offered annually to the teacher making the best progress in this language.

The system of roads maintained by the insular Government invariably attracts the attention of the visitors to Porto Rico. Until the time of the transfer of the island to the United States, the Spanish Government had built 166 miles of excellent macadam road. Since then 275 additional miles have been constructed, making a total of 441 miles of highway equal to the best in the United States. Owing to the heavy tropical rains, the mountainous topography of the country, and the fact that the roads of the island are necessarily built upon a foundation of loam, clay or decomposed rock, it is impossible to have "fairly good roads." The roads must either be of first class macadam and kept in excellent order, or they will rapidly deteriorate and become absolutely impassable in wet weather. The condition of the highways naturally enhances the pleasures of automobiling, and as soon as the country districts are supplied with a few good inns, Porto Rico may expect an influx of motor enthusiasts.

The most important work, from a hygienic standpoint, that is being carried on by the Government, is undoubtedly the systematic war waged against uncinariasis, a disease caused by an intestinal parasite, commonly known in the southern part of the United States as the hook worm. The discovery that this disease existed in Porto Rico was made

\* June 30, 1898, schools maintained, 551; school children enrolled, 25,664; average attendance, 18,243; teachers employed, 551.

1905, schools maintained, 1,104; school children enrolled, 68,855; average attendance, 45,201; teachers employed, 1,210.

in 1899 by an army surgeon in charge of a field hospital established for the treatment of sufferers from the destructive hurricane which visited the island in August of that year. Three-fourths of the patients were found to be afflicted with anemia, which at that time was believed to be due to lack of nourishing food. Inasmuch, however, as their condition was not improved by good food, hygienic surroundings and the ordinary medicines, careful microscopic examinations were made, which revealed the presence of a parasitic worm, known as *uncinaria*. Strange to say, the disease is usually communicated through abrasions in the foot and produces an anemic condition, with many symptoms of starvation, gradually sapping the strength and life of the patient. Infection can easily be avoided thru the use of shoes and the most simple sanitary precautions. In 1904, the Legislative Assembly, realizing the necessity of taking action to check the spread of this disease, appropriated the sum of \$5,000, and provided for the appointment of a commission for the study and treatment of *uncinariasis*. Thru the courtesy of the War Department and the Public Health and Marine Hospital Service, competent surgeons were detailed to serve on this commission, and tents and supplies were also loaned. Very soon after the commission had begun its work reports were spread thru the neighboring country of the numerous cures that were being made, and patients commenced to arrive from all directions for treatment, on some days the number amounting to five or six hundred. Frequently patients came from great distances, traveling the entire day on foot to reach the hospital. In other cases, those too ill to walk were carried for miles in hammocks, swung on the shoulders of friends and neighbors. In five months 4,500 cases were treated, with excellent results. Patients readily improve in strength under the treatment and many wage earners, who had been too ill to work, returned to their families completely cured.

The following year an appropriation of \$15,000 was secured and the work renewed with great activity; the cures amounting in that year to 22,500. It is now proposed to extend the work still

further. Central stations will be established in the important districts of the island, with numerous sub-stations in the smaller towns. The disease, which is almost wholly confined to the poorer classes, responds readily to treatment, and the cost of the medicine averages but 33 cents for each case. In addition to the cures effected, provision will be made for instructing the country people as to the cause of the disease and the methods of its prevention. As it has been estimated that 90 per cent. of the rural population of the island is afflicted, it can easily be understood that the presence of the disease seriously affects both social and economic conditions. The work must necessarily be slow owing to the fact that a great majority of the sufferers in the interior are illiterate, and can be reached only by personal contact, and great patience and perseverance must be exercised before the disease can finally be eradicated. The people, however, are rapidly awakening to the importance of this work, and the Porto Rican doctors thruout the island are enthusiastically co-operating with the Government.

But it is not from disease alone that the island has suffered. Less than a year after the American occupation Porto Rico was devastated by the most disastrous hurricane known in its history. In one day, August 8, 1899, it is estimated that 90 per cent. of the coffee crop, which at that time formed the basis of the wealth of the island, was destroyed, and great numbers of shade trees, so necessary for the cultivation of coffee, were uprooted. In many instances the rich soil of the hillsides was swept away into the valleys below, leaving nothing but bare rock. Extensive injury was also done to sugar cane, orange trees and cocoanut groves. At the same time the overproduction of coffee in Brazil caused the price of this product to fall, while the necessary readjustment of the channels of trade on account of the change of sovereignty contributed to retard industrial progress. With the exception of the coffee industry, however, the island is rapidly recovering from the effects of the hurricane. The value of the exports and imports for the past fiscal year was the greatest in its history. It is not gen-

erally realized that the commerce of the United States with Porto Rico is considerably greater than its trade with the Philippine Islands. This encouraging showing is due chiefly to the very great increase in the production of sugar cane and tobacco. The exportation of sugar has doubled in the past five years, while the value of the tobacco produced has increased almost 300 per cent. Porto Rican cigars are finding a ready market in the United States, and many acres heretofore unemployed or devoted to less remunerative crops are now being planted in tobacco. In addition to the two crops mentioned there are encouraging signs of activity in citrus fruit growing, and in the cultivation of cocoanuts, and sea island cotton.

Unfortunately, the coffee industry is not in as prosperous a condition. This product has never recovered from the destructive effects of the cyclone, and the exports now reach but 25 per cent. of their former value. Inasmuch as coffee has always been the crop of the small proprietor, this condition is even more serious than the figures indicate. According to the United States Census for 1899 the average size of a coffee plantation in that year was nine acres, and 41 per cent. of the total cultivated acreage of the island was planted in coffee. From these figures it can readily be understood that the wealth derived from the exportation of this product was very widely distributed, and that upon its future depends the prosperity or poverty of a very large section of the country. The great advance in the exportation of sugar and tobacco in the past few years could never have been realized, had not those two crops received the stimulus of a protective duty. Should this protection be extended to coffee thru a duty

of from 3 to 5 cents a pound upon foreign grown coffee, the prosperity of Porto Rico would be assured. This is by far the greatest need of the island at the present time, and by such an action the Philippine Islands and Hawaii would be benefited as well as Porto Rico. With the assistance of a protective duty, these three tropical portions of the United States could produce a large percentage of the coffee consumed in the entire country. The Porto Ricans, naturally, cannot understand why coffee should not be protected as well as sugar or rice, and are anxiously hoping for legislation by Congress to this end.

On one other point legislation by Congress is very necessary. In many instances natives of Porto Rico have been denied the rights of citizens of the United States; and, not being aliens, they do not come under the provisions of the naturalization law. Altho inhabitants of an island which will always belong to the United States, they are in a worse condition than any of the emigrants who come to our shores from foreign countries. They were classed as Spaniards under the Spanish administration; and it is to them a constant source of irritation and discontent that a country whose sovereignty they so enthusiastically welcomed, should deny to them a position equal to that which they formerly held under Spain. The uncertainty of their political status is apt to create a spirit of unrest which must be checked for the good of the American administration and of the island in general. The right of United States citizenship is one ardently desired by all. Their wish is heartily endorsed by all American officials on the island, and it is earnestly hoped that it will be granted by Congress in its present session.

SAN JUAN, PORTO RICO.

# Menelik, King of Kings

BY ROBERT P. SKINNER

(Mr. Skinner was United States Consul at Marseilles, France, when a short while ago he was temporarily relieved from duty in order to proceed to Abyssinia as the President's Commissioner and Plenipotentiary to the Negus. The officials of the Ethiopian expedition consisted of five officers and twenty-five United States marines and sailors. That it was eminently successful is proved by the fact that Mr. Skinner negotiated the first treaty between the United States and Ethiopia, which was approved by our Senate, and which brought Mr. Skinner the decoration of the Star of Ethiopia from King Menelik.—Editor.)

**M**ENELIK has created the United States of Abyssinia, a work for which he was endowed by Nature, with the constructive intelligence of a Bismarck, and the faculty for han-

unity is an accomplished fact, he is all McKinley; and, in the latter's language, proclaims that "the day of exclusiveness is over." All the men I have talked with concerning the Emperor's charac-

Ras Gualdo Gerginis. Whose Palace the Americans Occupied at Addis Ababa.

dling men of a McKinley. In his younger salad days, when the crown of Choa sat uneasily on his head and he was dreaming, even then, of a united Abyssinia, he knew how to be a Bismarck; today, now that his country's

ter, however else they may differ in their judgments, agree in asserting that his natural impulses are every one in favor of methods of conciliation and kindness.

An example of this is found in the story, which, though not new, will bear

retelling, of his reception of the King of Kaffa, his whilom rebellious vassal. Made prisoner and brought to the imperial presence, the King prostrated himself, and, placing a stone on the back of his neck, waited for Menelik to speak. The Emperor's wrath rose at the sight of his enemy, and his soldiers cried out for vengeance. After the tumult had lasted for some moments, the monarch commanded silence, and, addressing the prisoner, said: "Throw off that stone and retire. You are less to be blamed than they here who wish me to pass sentence on you in my anger." The King of Kaffa withdrew, and the Emperor deferred decision, until his calmer mood should enable him to be wise as well as just.

Menelik was born in 1842, and claims to be the descendant of the Queen of Sheba, whose own son, of the same name, was reputed to be the son of Solomon. The steps by which the present ruler of Abyssinia, having freed his hereditary kingdom of Choa from its subordination to Tigré and restored it to its ancient primacy, proceeded to weld these two States, together with Godjam and other smaller feudatories, into one empire, are too contemporary to need repeating here. They issued in the fateful battle of Adowa, in 1896, after which

the political independence of the country became a recognized fact.

The modern visitor to the capital, Addis Ababa, is agreeably surprised to find himself traveling over smooth and well-constructed roads, which are only one of the many improvements Menelik is rapidly introducing into his native land. The Imperial Palace occupies the crest of a hill and dominates the whole city. Standing in garden grounds enclosed by a thatched stone wall, it comprises a number of buildings, in a style superior to anything to be seen elsewhere within the country's boundaries, to which access is obtained by traversing several courtyards and a spacious "campus," where are stationed the only body of regularly European-trained troops in the Ethiopian army. A wide doorway of Indian design admits the newcomer to the audience hall, a large, half-church-like structure with a roof supported by timber bridge work, at the far end of which stands the throne. The floor is covered with Oriental rugs, mixed with certain products of French and German looms, and back of the lines formed by the pillars are massed, on ceremonial occasions, in either aisle, hundreds of the chief people of the capital, dressed in many colored raiment. The throne itself is a sort of divan, and occupies a plat-

Entrance to the Emperor's Palace at Addis Ababa.

Kagnazmatch Ahaba, Nephew of Ras Makonnen, in War Costume with His Chiefs.

form which extends right across the audience hall. Over it is a canopy resting on four gilded pillars—a gift of the French Republic. At receptions, each side of it is defended by two young princes with guns, while behind and round are grouped the ministers, judges and officers of the court.

The first impression made by the Emperor is a distinctly pleasing one. His face is full of intelligence and his manners are those of a gentleman no less than of a king. He sits in Oriental fashion, his legs crossed and his arms sustained by two cushions. He wears as outer garment a red velvet mantle, which affords glimpses of a snowy-white under clothing, and about his head is wound a white handkerchief. Diamond eardrops hang at either cheek, and both hands are adorned with rings. To converse with the stranger he makes use of his private secretary, who is also his interpreter, since he speaks no other language than those of Abyssinia, the official tongue being Amharic. Some scraps of French he can, upon occasion, employ apropos, and to an English-speaking person he will, as a compliment,

address a "how-do." Ordinarily, his voice is pitched low, in a dialogue key, with no pretense of appealing to the numerous listeners around him. No trace of hesitation is visible in his replies; it is characteristic of him to seize a point rapidly, and to determine his line of action promptly. For instance, when invited, officially, to participate in the Louisiana Purchase Exhibition, he at once accepted, with the remark that the details could be discussed later on. Moreover, his Majesty has that quality of responsiveness which contributes to a flow of uninterrupted exchange of ideas and places the visitor at his ease; an interview of more than half an hour seems at the close to have been an affair of a few minutes only.

The Emperor's thirst for information is phenomenal, and his knowledge of other countries is more considerable than one might imagine from the meager sources at his disposal. He can discourse on the United States' recent war with Spain, and, more summarily, on the war of independence with Great Britain. Of the power and influence of the great North American Republic he possesses

many notions, but vague. President Roosevelt he has evidently learned a good deal about, and seems to be much interested in his personality. Having heard that the President is a sportsman, he expressed the hope of seeing him some day in Ethiopia, inquired his age and was eager to have the story of his election narrated. The length of the great American rivers, the size of the cities are matters, too, on which he is inquisitive; and the various facts thus acquired appear to be classified with a view to utilization in the future.

It has been frequently said that Menelik regards the presence of the European legations in Addis-Ababa as an indirect acknowledgment of a sort of over-lordship on his part, much as the Chinese formerly esteemed the foreign legations in Peking as a recognition of the superior civilization of the Flowery Kingdom. Such an assertion is quite unfair to the Ethiopians and their monarch. It is probable that, relatively to his means of information, Menelik has an appreciation as just as any practical statesman whatsoever of his own country compared with others. Japan being among the nations he admires, he is trying to imitate her example. The new railroad, the new highways, the bridges, the telephones—for there is telephonic communication in Abyssinia—all these things he very likely cares little for in themselves; but he realizes that nations must progress if they would survive. He wishes to raise his people to the comprehension and exploitation of modern inventions and improvements, so that these may serve for the country's defense and the nation's liberty.

The royal etiquet in eating is somewhat exclusive. Only the greatest and most faithful in the land may witness the Emperor at a meal, and none may eat in his presence. This rule is relaxed in favor of the diplomatic corps and such foreigners as are sometimes asked to luncheon, on the ground that they represent the persons of His Majesty's equals. As he prefers native dishes and native cooking, an expedient is adopted, at such repasts, by which his cover is provided and he is constructively present at a European table. Actually, he sits upon his throne with a small service separate-

ly arranged for him. To the left of this is the long conventional guests' table with its European covers, including his own. The imperial host receives those he has invited with a smile and shake of the hand; and during the feast sends over for their delectation one or another of his Ethiopian dainties. These dishes are invariably seasoned with some sort of concentrated fire, which seems to race thru the system and scarify the whole alimentary tract; apparently aware of the effect produced upon foreigners, the Emperor gives a cheerful nod of encouragement and recommends copious drafts of a fine musty old "tedj" to relieve the situation. Coffee, smoking and shawm music form the agreeable sequel to a banquet of this kind.

Much stress is laid by returned travelers upon the presumed fact that nothing can be accomplished in Ethiopia of an official character without a judicious distribution of presents. Whatever color may be given to this accusation by the venality of certain functionaries tempted by the largess of foreigners who for so many years have been overbidding each other in the Negus's dominions, it is grossly unfair to Menelik to assume that his favor can be virtually bought by bribes. The Abyssinian tradition requires that the stranger shall bring gifts, as the wise men did to the Christ child two thousand years ago; but the value of the gift resides in the intention of the giver, a distinction which should be constantly borne in mind. The signed portrait of President Roosevelt, which the American mission included in its souvenirs, gave the Emperor unfeigned pleasure. He studied the face for a while and then passed it on to a group of generals who scrutinized it with equal interest. The President's book on "North American Big Game" was likewise received with great respect. He thought it remarkable that a young man should have accomplished so much. On a beautiful American writing machine being offered him from the manufacturers, his practical mind immediately suggested the question: "Why can't we have an Amharic typewriter?" to which answer was made that on account of the two hundred and fifty-one letters in the Amharic language, the construction of a

machine allowing their manipulation presented almost insuperable difficulties. Perhaps the gift which interested the Emperor most was a magazine rifle of

trated the method of loading and firing, the Emperor following his movements with the eye of a connoisseur and nodding approvingly at the explanations.

The Emperor Menelik II.

After P. Buffet, in the Luxembourg Museum.

the latest model, a most beautiful weapon with burnished barrel and gold plated mountings, bearing a special inscription. One of the American party, who had a similar rifle with him, illus-

In order to give a more practical demonstration of its qualities the American gentleman was requested to fire thru an open doorway at a blank wall. Ten shots rang out with startling celerity of

succession, and generals, colonels and subordinates crowded at the doorway to behold the results. These were so satisfactory that His Majesty determined to try his new weapon himself; and, without changing his position on the throne, raised the gun to the proper angle and aimed thru the same doorway, paying but slight heed to the throng of notabilities in proximity. There was, of course, a wild stampede on the part of the court dignitaries as soon as the imperial hand touched the trigger; and His Majesty's twinkling eyes showed his humorous appreciation of the situation. Blank cartridges are practically unknown in Abyssinia. When Menelik ascertained that they were employed for saluting purposes by his American visitors he intimated his desire to possess a few.

"I am going to my country place at Addis-Alem next week," he said, "and I shall be accompanied by many officers. I expect to amuse myself with these cartridges. I shall be able to teach some of my officers to show courage under fire."

All the Emperor's friends bear testimony to his general good humor and love of joking. The same quick observation of detail already alluded to above was manifested by his Majesty in visiting the quarters of the American mission while stationed in the Capital. He walked slowly round the enclosure, criticising, with a soldier's glance, the sailors' canvas hammocks, the haversacks, and their contents, and particularly the hospital tent, including its compact case of medicines and simple instruments. He remarked that he thought it all very nice and comfortable, but not so easy of transportation as the Ethiopian equipment. In this he was perfectly right, since the latter consists of a small, very light wall tent with bamboo poles, and a gun. That the comment was, by no means, the outcome of a self-sufficient spirit is evident from the general tenor of the Emperor's conduct. Indeed, he frankly acknowledges his subjects' needs and wants. On its being suggested to him that he should send some of his young men to the American schools and colleges, he replied:

"Yes, that will come; our young men

must be educated. We have much to do. We are a very primitive people."

On the other hand, he has a race pride in common with all Ethiopians, who resent being considered as negroes, and who, as a matter of fact, possess none of the striking negroid characteristics, save that of color. In thickness of skull, facial formation, shape of the foot, and notably of the heel, the Ethiopian is quite unlike the negro; and the resemblance of complexion is not uniform. Seven distinct shades are recognized by students of the Abyssinian complexion, which varies between light olive green and intense black. As might be supposed, personal vanity is highly flattered when the lucky individual rejoices in one of the lighter tints of skin.

In this connection an anecdote of the Emperor may not be out of place. Some years ago, Mr. Benito Sylvain, a highly educated young Haitian of wealthy parentage, and of full negro blood, conceived the idea of a journey to Menelik's court, in order to secure the Emperor's adhesion to a program for the general amelioration of the negro race. To Mr. Sylvain it seemed especially appropriate that the greatest black man in the world should be the honorary president of his projected society. The Negus is said to have listened with great patience to the exposition of his visitor's plan, and to have then replied, with his dry humor:

"Yours is a most excellent idea, my young friend, the negro should be uplifted. I applaud your theory and I wish you the greatest possible success. But in coming to me to take the leadership you are knocking at the wrong door, so to speak. You know, I am not a negro at all; I am a Caucasian."

A delicate trait in Menelik's character that deserves notice was revealed by the circumstances attending the American mission's departure from Addis-Ababa. The treaty between Ethiopia and America had been signed, and, in acknowledgment of the strangers' gifts, the various officers and members of the mission had received, as a keepsake from the Emperor, two lances, a decorated buckler and a sword of honor, while to the United States President had been offered thru his delegates two young lions and a couple of superb elephant's tusks of

three hundred and eighty-four pounds weight. At the final interview for leave-taking, the head of the mission handed to the Emperor a small bronze bust of Washington; and the Emperor, on his side, produced the royal decorations which he intended to bestow. It had been previously explained to him that, under the American form of government, the members of the mission were not at liberty to accept such distinctions without referring to the home authorities, and he had replied that he wished, notwithstanding, to have the pleasure of offering a decoration to the officers and a medal to the men, as he would not like it to be suspected that honors of this kind which he sometimes showed to official visitors had been omitted designedly. So His Majesty personally gave the medallion and ribbon of the Star of Ethiopia to each of the five officers present, and the medals were distributed to the men by the Great Chamberlain. On the patent accompanying the decorations was inscribed:

"The Lion of the Tribe of Judah has conquered. Menelik, chosen of the Lord, King of Kings of Ethiopia. To all who see these presents, greeting! As the kingdoms of the earth decorate the doers therein for their discernment, their intelligence, their valiance and their ability, so we decorate . . . in our order of the Star of Ethiopia, the insignia of which he has our permission to wear upon his breast."

After all our soldiers had stepped forward, saluted and retired, it was seen that two medals still remained on the silver dish from which they had been distributed. Now, it had been quite casually mentioned to the Emperor on the day of the mission's arrival that two of the soldiers had been sent back from the railway terminus to their ship, on account of illness. Pointing to the two medals, the Emperor said:

"Altho two of your American soldiers could not come any further than Diré-Daouah with you, I don't want them to be left out of this little ceremony, which marks a beginning in our relations that will have some place in history. So I wish you to take these medals back with you and present them in my name to the

two sick men as souvenirs of this occasion."

As an evidence of kindly thought and tact this occurrence is worthy of permanent record. The decorations conferred upon the commissioned officers of the United States have since been deposited with the Department of State at Washington, as the statute requires. The civilian officers and others of the party, not being regarded as officers of the United States in the sense of the constitutional provision as to decorations, have either received their decorations, or, in the case of enlisted men, they have been sent to the Navy Department for such disposition as may be deemed proper.

The Empress Taitu rarely or never assists at the reception of visitors, unless some public ceremony is involved absolutely requiring her presence. She is said to be a woman of great force of character and to have been in her youth of striking beauty. She is now forty-seven years of age, and is the daughter of a former Ras of Gondar and one of the hereditary princesses of the absorbed kingdom of Siemen, the inhabitants of which are reputed for their white skins. Several times married previously, she became the wife of Menelik in 1883. They have no children. This fact raises the question of the succession in the mind of every one visiting the Empire. In Europe the Ras Makonnen, a son of Menelik's sister, is regarded by many as the most probable successor. He is beyond all doubt a capable and conservative man, whose frequent journeys to Europe have equipped him for the task, should he be called upon to assume it. Others pretend that a grandson of the Emperor, still a child and much in his company, will ultimately wear the crown. However, until the Emperor discloses his own intentions, all this is mere speculation.

Fortunately for Ethiopia and the peace of the world, Menelik bids fair to resist the ravages of time for a long while yet. His vigorous manhood is attributed to a knowledge of "the science of proper living, the benefits of temperance in all things and the healthful influence of a balanced mind from which all worries are expelled and few gain entrance."

# An Incident of the Sweat Shop

BY BERTHA POOLE

"Stitch—stitch—stitch—  
In poverty, hunger and dirt;  
And still with a voice of dolorous pitch—  
Would that its tone could reach the rich  
She sang this song of the shirt!"

"SIX cents, lady." I took a pair of men's trousers from the pile on the floor and looked at the quaint little figure rocking slowly in the high back chair. She was an old German

faster. They finish in half that time. Does not the lady think the boss kind? He lets me take the work home, now that I am old, and the noise of the machine bothers my head. If it were not for his kindness I should starve.

"Yes, the lady is right. It makes a difference in the pay. Eight cents for those who work in the shop and six for me. But what can you do? There is

Her Real Photograph.

woman, sixty-four years old, living quite alone, in a little room ten by twelve, in a rear tenement. Her head, with its black crocheted kerchief, nodded gently as I examined the sewing.

"Yes; that is what they pay: six cents for finishing, two hours' sewing on each pair. But the boss does not know that," she added quickly, "the rheumatism in my hands makes me slow. Girls work much

not enough work for the young, lady—the old have no chance. Often one pair is all the work I can get; then, like to-day, I am given eight pair to finish before night.

"What are the hours? Why, lady, that depends upon the season. In summer, when there is a rush order, I work from five in the morning till nine at night, but in winter it is too cold—the hands do not

early get over the stiffness and I must work much later, till midnight and after.

"No, it is not as hard as the lady would think. One gets accustomed to all things, and I have sewed all my life—first in the old country and then here in Chicago, for all of thirty-three years.

"If only one could be sure of the rent. The houseman (owner) is very kind, but he must have his money, and it is not very easy to find all of two dollars each month. The lady can see how one must be careful. Meat is not possible, nor milk for the coffee, but always there is one meal a day and often two.

"The hunger does not make the heart ache, lady. It is for my child that I cry. Is it not strange that the machine should kill her? She was young, only forty, and had worked but thirty years. Yet it killed her, lady. Yes, it did. The machine killed her; the fastest worker in the shop. I have thought about it often, and I know. That is why I cannot work in the shop. The machine speaks always the same, and he speaks true, 'I did it! I did it!'"

The needle fell from the trembling, swollen fingers. The old woman buried her face in the rough woolen pants she was finishing.

CHICAGO, ILL.

## How a Town Can Get a Library

BY JOHN COTTON DANA

LIBRARIAN OF THE FREE PUBLIC LIBRARY OF NEWARK, N. J.

LET it produce its Thomas Bodley, This is the best of all methods. Thomas Bodley, an English gentleman, had long devoted himself to public affairs; had traveled much, had made many friends; but finding, at fifty-two, that public life no longer gave him pleasure and wishing still to be of some use in the world, he resolved, in his own words, "to possess his soul in peace, to take farewell of State employments, to satisfy his mind with the mediocrity of worldly living which he had, and retire from court." Whereupon, in 1596, "examining exactly what course he might take for the rest of his life, he concluded at the last to set up his staff at the library door in Oxford, being thoroly persuaded that he could not busy himself to better purpose than by reducing that place to the public use of students." He found the library a ruined waste, hardly better than none. He left it a proper library. He bought books for it; he laid down rules for its management; he endowed it when he died. And it endures and grows to this day, to the glory of Oxford, of England, and of all the English speaking world. As Bodley for Oxford and England, so for every town should some good man busy himself to establish a library to that town's betterment, to the delight of students, and to the promotion of scholarship.

But if your town has no Bodley it still may get its library. Times have changed since Bodley's day. Books are many and cost little, where then they were few and highly prized. Books being many, libraries are many also. The libraries have called forth librarians. Caring for books is not greatly a gainful occupation and has appealed as a lifework to few save those who find in its delights a sufficient supplement to its modest payments. Therefore, even as in Bodley's day, librarians are born to the craft, not bred. And therefore, again, even in a country where money is king those who care for libraries have a zeal in their work which has made them wise in the arts of arrangement, organization, co-operation and promotion. Thus it has come about, as I shall try briefly to show, that the laws for the maintenance of libraries, and the arts of their establishment and management are so fit and ready that it is easy for any town to provide itself with one of these excellent organizations, of which books are the cellular tissue, a librarian the will power and the public at once the creator and the beneficiary.

Your town has no library and you wish it to have one. You find yourself, or you think you do, alone in the thought. Write to the Publishing Board of the American Library Association, 10½ Beacon street, Boston, Mass., and tell them of

your wish. You will receive at once a little pamphlet called, "Why do we need a Public Library?" For it you can pay five cents, if you will. This tract is one of many things put forth by this association of 1,200 American libraries. Other tracts, reprints, journals, circulars and books from the same source tell you how to build a library, how to furnish it, how to get a librarian; others tell the librarian how to select books and how to manage a library. For the present you are concerned only with the one mentioned, which tells you what arguments to use to persuade others that your town should have a library, and how so to interest others that they will listen to your arguments. You read and put in practice.

But perhaps the soil is thin, or your time and patience are limited. Write, then, to the Public Library Commission, at the capital of your State, and say your town should have a library and ask if they will help it to get one. As twenty-one States have such commissions, you will doubtless find your State has one. You will receive a pamphlet giving the State's library laws, a list of towns in the State which have libraries, descriptions of many of them, and instructions how to set the library laws in action in your town. Also, you will receive a letter asking for information about your community, offering counsel, and very probably offering also State aid. More than this, you will probably soon receive a call from an alert young woman who will tell you that she is the agent of the commission; that she is a sort of professional promoter and organizer of libraries; that it is her business to find a desire for libraries where none seems to exist; that she has traveled all over your State, knows the temper and tendency of its people, is acquainted with all the ways in which libraries get their beginnings, and has come to help you.

From her, or from the letters and pamphlets your commission sends you, you learn that your town can, if it will, adopt the provisions of the Library Act at the next election (this is true in many States; in some the method is even simpler); that the commission can supply your library with \$100 worth of books if you can begin with a like amount supplied by the town; and that many places

like your own have been easily persuaded that a public library is worth having and been induced to establish one. From the commission's agent you will learn how the arts of library promotion have been successfully worked in other communities, and taking counsel with her, you begin to apply some of these arts.

The school teachers, the lawyers, the ministers, the well known readers, the members of study clubs and public spirited persons generally are considered, and a few of the more hopeful of them are interviewed, by yourself or by the commission's promoter. The local paper gives its support—and this it almost never fails to do—and a conference is held of a few of those most interested. From here on the course is comparatively easy. The stories of the growth of the library idea in hundreds of American towns and cities, from their origin in the minds of two or three to the complete library, have many features in common. The number of them is indicated by the fact that in the fourteen years following 1891 the number of libraries in the country increased by over 3,000.

I began by assuming that you are the one person in your town who wishes to see a public library there established. The assumption is probably not correct. In most towns and villages, certainly in most of those in the North, the thought of a library is in many minds, and waits only on the initiative of some persistent person to lead to positive action. In many towns a magazine club is in existence already and willingly lends its influence to the work. In many is a reading or study club which has long felt the need of a supply of books on which it can draw. In many there is already a library maintained by private subscription, perhaps the child of old lyceum days or of later institutions, like the Grange or of a woman's study club. The friends and owners of this semi-public library, usually dormant after its first few years of life, will almost always surrender it to the public at large as soon as they are assured that it will be adequately sustained and properly used. And thus, in one way and another, the one inquiring spirit finds, at the very beginning of his search for a library, friends ready to es-

pouse its cause, very often books ready to his hand, counsel and assistance from his State, and expert advice from the national library organization.

At this early stage of his inquiry he learns also that the commission will send to him on request a library ready made! This is true in many States, probably in your own. If you have not done so already, write to the commission at the capital and ask for a traveling library. After brief correspondence and at very slight expense for transportation you receive a collection of fifty to one hundred books, properly ticketed and listed, adapted to local needs as you have noted them, and ready to be lent in single volumes to any who wish them. This is a traveling library. It gives you a chance to see if any one in your town cares for books. The commission's agent can tell you about it. For another five cents you can get an interesting pamphlet on the method of its use from the people already spoken of in Boston. You can keep this library a few weeks or a few months and exchange it for another. If you succeed in establishing a local library you can supplement its books with one of these constantly changing collections.

You find that library interest in your place is greater than you thought; and perhaps a movement for a library is now well under way. But you wish to hasten it. From the commission's report or from their agent you have learned that there is an active association of library people in your own State. From the Boston headquarters you get on request another leaflet which tells you about associations of this kind (there are about sixty of them in the country), and directs you to your own. You communicate with it. If you find no simpler method of learning about it you write to any library in the State, or to any in the whole country for that matter, and learn at once that it is part of your State association's business to help persons like yourself to carry to successful issue the task of founding a library in your town. This association, probably in co-operation with the commission, will consider at once your suggestion or will make the suggestion itself that it hold a meeting in your place.

You have now got in touch with the

national organization of libraries; with the library commission of your State and its expert adviser; with the traveling library system; with your own State library organization; with the friends, including the newspaper, of a library in your own community, and with individual librarians of experience in other places. You know what you can do under your State laws and you know the trend of local opinion. The experience of many scores of towns indicates that from now on progress will be easy and rapid. Perhaps a generous local benefactor appears; perhaps a subscription list meets with unexpected success; and perhaps, tho it is not the best thing that can happen, a professional founder of libraries is called on and responds.

A few words more about the management of the library when it comes into being. Send again to Boston and get a little tract on library rooms and buildings, and another on the essentials of library management. Looking these over you will find that every library, even the smallest, if it is to justify its cost, must be properly arranged, and, most important of all things, skillfully conducted. The early mistakes of a public institution which is just beginning to seek public patronage and public support are the ones which are most disastrous. Send for the commission's agent. In the light of your brief look at a little of the literature of the subject of library management, expound to her the local situation. Your own good sense will lead you to fall in with her advice. You will employ an expert if you have money enough. If you must take local untrained talent, let her be young, wideawake, ambitious, even if not known as fond of books from a remote childhood. See to it that this vigorous person acquaints herself thoroly at once with the best things in print on library management. You have learned in an hour's reading, of the things already mentioned, that library economy is not a simple subject, that there is much on it in print and that it is not all to be assimilated in a day. Send her to the nearest active, up to date library two or three times, to see in practice the things she reads of. Give her full control and ask for results.

# Literature

## A New Book of Common Prayer

VERY neat and beautifully printed is this new candidate for the favor of the Presbyterian churches, and other churches as well.\* Very properly might half a dozen experts review it with various purpose. One might discuss it historically, and show the origin of the prayers, the changes required for modern use, and analyze the style and unity of the new prayers inserted. We content ourselves with giving the impression of the attempt to change the free worship of the Presbyterian churches into a fixed liturgical order.

Be it understood that the editors, of whom Prof. Henry van Dyke is the chief author, as he is the champion of the liturgical innovation, are very careful over and over again to make it clear that nothing in this order is compulsory, even altho here and there the rubric reads "Here the minister *shall* say," instead of "*may* say." But nevertheless the idea of it is that it is better, for dignity and fitness, that the common minister, who is likely to go astray, should use this order, and so be delivered from rudeness of expression in worship. As between the two methods, free or ordered, doubtless the former, being less formal, is less likely to be spoken by rote, and comes closer to the heart of the common people. That prayer may be uttered grammatically and sonorously is well, but that it come fresh from the heart is more important—and we observe some solecisms in this book, as (page 4) "Almighty God, who *doth* freely pardon," and "*an* unity of love" (page 145).

But the tendency to formalism in worship is so easy a descent—tho ritualism is called *high*—that one questions when he sees the old Presbyterian Church hankering to exchange its noble freedom for the Episcopal service. When we recall what an easy and passive road it leads the minister to travel, and how formalism grows, how religion has been enslaved by honoring it with a formal

reverence and worship circumscribed, how they hallowed it, fumed it, sprinkled it, bedecked it with pure linen instead of pure innocence, and then added the palls and miters of Aaron's old wardrobe or the flamens' vestry, and set the priest to con his postures and liturgies, drudging in the trade of outward conformity, it is not strange the heavenly flight was so often forgotten that we fear the new adventure on an old road.

But granting the premise, which is unuttered but in mind, that the Presbyterians want a liturgy for their stylish city churches, so that their young people may not be drawn to the Episcopal churches, this is a very good prayer-book. Professor van Dyke is a man of choice taste; and good taste is the merit of the volume—altho we cannot but raise the doubt whether the whole thing would not have offended his sturdy, plain Presbyterian father, Dr. Van Dyke. There are orders of service for all occasions; and very well conceived, after the old pattern, they are—often improved. One turns naturally to the order for marriage and that for burial. In the former it is only inevitable that the word "obey" should be omitted. The promises are nearly the same for both the man and the woman:

"Wilt thou have this Man [or Woman] to be thy husband [or wife], and wilt thou pledge thy troth to him [or her] in all love and honor, in all duty and service, in all faith and tenderness, to live with him and cherish him [or her] according to the ordinance of God in the holy bond of Marriage?"

There is nothing in it about Isaac and Rebekah, but we are sorry to say that the disagreeable and utterly unnecessary call for "impediments"—"If there be any here present who knows any just cause," and "If either of you know any impediment"—are retained. The burial service is nearly spoilt by retaining the Ninetieth Psalm, a psalm which is not fit for such an occasion. Think of saying to the mourners: "We are consumed by thine anger, and by thy wrath are we troubled," or "Who knoweth the power of thine anger? even according to thy fear so is thy wrath." It is a time for comfort, not for harrowing the feelings of the mourners. Other passages to be read

\* THE BOOK OF COMMON WORSHIP. Published by Authority of the General Assembly of the Presbyterian Church in the United States of America. For Voluntary Use in the Churches. 16mo, pp. x 263. Presbyterian Board of Publication, Philadelphia.

are not much better. Indeed, the Psalter is much overdone in this and other books of common worship. We have here sixty selections for church worship, all from the Psalms. Take that for Good Friday, the Twenty-second Psalm: "Many bulls have compassed me, strong bulls of Bashan have beset me round. They gaped upon me," etc.; and all this, which applies neither to the hearer nor to Christ, just for the sake of the verse quoted by Matthew: "They part my garments among them, and cast lots upon my vesture." But there is this reason in this case, as the psalm has been called Messianic; but there is no such reason for including Psalm 70 in selection 24: "Let them be ashamed and confounded that seek after my soul," etc. It is well to remember Isaac Watts's notes on versifying certain imprecatory psalms. One of them reads: "Cursing one's enemies is not so evangelical a practice. I have therefore given some verses of this psalm another turn." And in this connection we may add that in their search for their "Treasury of Prayers," new and old, we are glad the editors did not include the petition with which John Milton ended his "Reformation in England." After a most noble prayer for England and all those who help its honor, freedom and religion, he turns to those who would enslave it, and in the very spirit of David he concludes:

"But they, contrary, that by the impairing and diminution of the true faith, the distresses and servitude of their country, aspire to high dignity, rule and promotion here, after a shameful end in this life, which God grant them, shall be thrown down eternally into the darkest and deepest gulf of Hell, where, under the despiteful control, he trample and spurn of all the other damned that in the anguish of their torture shall have no other ease than to exercise a raving and bestial tyranny over them as their slaves and negroes, they shall remain in that plight forever, the basest, the lowermost, the most dejected, most underfoot, and downtrodden vassals of perdition."

We fear we have not suitably expressed the general excellence of this volume for those that like and need it. It has the old formal flavor. It is even suitably bespecked with capitals. The psalms for chanting have Latin titles. The spelling is archaic or English—such as *favour*, *honour*, *favourable*, *honourable*. But we must not close without calling attention to what may be a new

prayer for "Deliverance from National Sins":

"From all dishonesty and civic corruption; from all vainglory and selfish luxury; from all cruelty and the spirit of violence; from covetousness, which is idolatry; from impurity, which defiles the temple of the Holy Spirit; and from intemperance, which is the mistress of many crimes and sorrows, good Lord, deliver and save us and our children," etc.

It has the literary balance so familiar to the ear, and that excellent definite indefiniteness which is all printed worship will allow, but which oral prayer can modify as occasion requires.

We heartily commend the book to those that require such aid to retain their worshipers, in an age when even religion needs adornment.

### Avery's History of the United States

SOME time ago, Professor Maitland, of Cambridge University, remarked that a nation seriously interested in its past was apt likewise to be concerned about its future; that when Englishmen were busy with the history of their law they were specially active in reforming it. Whether antiquarians and historians are more interested in the live problems of their own day than those who know nothing about the composition of the Roman *comitia*, or procedure in an Anglo-Saxon shire court, is a question open to dispute. However, the general proposition seems true that the person who cares not a whit how civilization came to be what it is, is very likely to care not a whit what it is possible to make it. Therefore, if the actual reading of American history increases proportionally to the number of works, in single volumes and in series, now being turned from the press, publishers, authors, academicians, and social reformers ought to feel encouraged.

Americans certainly cannot complain of lack of opportunities of finding out about their past, if finding out about their past consists in acquiring a knowledge of historical events arranged in chronological or some systematic order. In their search among the multifarious literature of our day they will find in Avery's *History of the United States*

*and Its People* a truly monumental work.\* accurate, full, clearly written, and excellently adapted to the public for which it is designed. True, it is a conventional history, not an attempt at a new historical synthesis; its designer and author has been practically undisturbed by the methods of social and economic science. He gives a straightforward narrative of our history based upon the best results of specialized research. It cannot be pointed out too often, however, that Mr. Avery does not deserve all the credit for the success of his undertaking; it is well known that his materials have been worked and reworked by laborious

this volume is chronological and topical. Two chapters bring the history of Virginia down to the days of Arlington and Culpepper (1674). Maryland, Manhattan, New Netherland, and New Sweden are treated in four chapters; the English colonial system is finished off in about ten fragmentary and disjointed pages; the growth of the Separatist movement in England occupies one chapter; and the remainder of the book is devoted to the New England colonies, down to the middle of the seventeenth century. The story of the founding of the respective colonies is told in a clear and readable fashion; the character of the settlers and

Champlain's Attack on the Iroquois Fort. From Avery's "History of the United States." Burrows.

scholars, whose assistance should be acknowledged, at least.

The second volume of this notable enterprise is now before the public. It contains eighteen chapters on Colonial history during the seventeenth century, with some reference to the English background of the period. For some apparently inexplicable reason, the volume opens with a section on the history of New France, from 1600 to 1635, which has no particular relation to the remainder of the text and would have been better placed with the history of New France when it is brought into relation to our own story. The arrangement of

their political and ecclesiastical institutions are discussed as the narrative proceeds—perhaps the best method to be pursued in a history for a public which cares little for institutional history in the abstract.

Considering the bewildering and increasing flood of special literature with which the historian has to cope, Mr. Avery has been remarkably accurate—due in some undiscoverable measure to the able assistance he has received. It is true that students with a penchant for the microscopic have enumerated a goodly list of apparent errors, which, when thoroly sifted, are of little or no vital importance. This cataloging of minor errors, which is easily done by students who have not the first elements of his-

\* A HISTORY OF THE UNITED STATES AND ITS PEOPLE FROM THEIR EARLIEST RECORDS TO THE PRESENT TIME. By Elroy McKendree Avery. Vol. II. Cleveland: Burrows Brothers & Co.

torical insight or co-ordinating capacity, has stung Mr. Avery into some rather sharp remarks in his Preface, about "abysmal notes, overladen with trivial details." These rebukes intended for pedants would be all right in a private conversation, but, appearing in cold print, they detract from the dignity of the volume.

However, some of Mr. Avery's statements in the portions where he generalizes on English conditions are open to question. For example, the assertion (p. 21) that the English king never could legally act in public matters without the counsel of his advisers is not only historically inaccurate, but betrays a misconception of the actual process by which public law grew up in England. Again, Gairdner and Gasquet have clearly demonstrated that Wyclif was not "the morning star of the Reformation," whatever that may mean. (p. 94) "The Microbic Research," which Mr. Avery depreciates in his Preface, might easily discover more debatable propositions.

The English in which the volume is written is not remarkable for piquancy, charm, or imagery; it is sober, measured, and sometimes laborious; but in general it is clear and simple enough to please the average reader. Occasionally Mr. Avery indulges in fine writing, and here he can hardly be called successful; when he leaves plain statement of fact and strays amid flowery fields he sometimes writes curiosities like the following: "Luther sprang up in Germany, a moral volcano that shot its glare across western Europe. . . . Aided by an amorous eruption on the throne, England cut loose from Rome and snatched her crown from the shadow of the tiara."

This volume, like its predecessor, is handsomely printed and bound; the maps are numerous, excellently designed and executed, and the story adorned with illustrations which are both pointed and interesting. The publishers certainly deserve the highest praise for their work.

**Man and the Earth.** By Nathaniel Southgate Shaler. New York: Fox, Duffield & Co. \$1.50.

It would be difficult to match this little book with another so simple, so edge and so inspired with loving rever-

ence for our common mother, the young old Earth. It was the author's last production, and it furnishes a fitting close to his lifework. The earth is a bounteous mother, who showered wealth upon her children, who, alas! have too much greed and too little intelligence rightly to use her dower. Particularly do we waste the natural inheritance that belongs as much to our children as to us. Those who come after us "will date the end of barbarism from the time when the generations began to feel that they rightfully had no more than a life estate in this sphere, with no right to squander the inheritance of their kind." The enormous drafts that have been made on our common storehouse during the last century are strikingly presented. Iron, for instance, which four centuries ago was used, in even the most civilized countries, to the extent of not more than ten pounds per capita, is now used in the United States to the extent of 500 pounds per capita. Three hundred years ago there were not more than twenty substances taken from the earth; today the substances and their immediate derivatives so taken number several hundreds. Petroleum alone has afforded the basis for more earth products than were in use when America was discovered. Many of the mineral stores show signs of exhaustion. Coal, oil, rock gas and peat are all in this class. Iron is held in greater store and well for us, since it is our most indispensable metal. The loss of gold would not trouble us much, and of silver not at all; lead, zinc, tin and even mercury could be spared. Copper is so far essential in transmitting electricity, but in time may give way to a substitute. One after one the earth substances are thus considered, and speculations given on their duration of use. Looking at the earth as a whole, Professor Shaler considers the changes likely to occur during the human period. Volcanic action, for instance, he finds a fairly constant element. He inclines to the theory that it is "due to the inclosure of water in the stratified rocks at the time when they are laid down on the sea floor; this crevice water becomes heated as the rocks become deeply buried, and by the central heat is brought to an exploding strain." The loss of life from

volcanic action is far less than that "from any of the common diseases of our kind—vastly less than that from war or famine." The continents appear to be growing in extent and penning the sea into more restricted areas. He concludes:

"We may look forward with an assured mind to the future of man on this planet. He is young, and the sphere, for all its age, still young. We may well rejoice in our anticipation of the great and long-continued work they are to do together before their great task is done."

**Further Memoirs of the Whig Party, 1807-1821.** With Some Miscellaneous Reminiscences. By Henry Richard Vassall, Third Lord Holland. Edited by Lord Stavordale. New York. E. P. Dutton & Co. \$5.00.

The fourth Lord Holland, like the second in succession, was never politically prominent; and what little title he has to literary fame rests on his editing in 1850 the first part of the "Memoirs of the Whig Party," which, like this later volume, had been written by his father, the third Lord Holland, who, after the Whigs came back to power in 1830, was of the Grey and Melbourne administrations in the minor, almost sinecure, office of Chancellor of the Duchy of Lancaster. Lord Stavordale, who has edited these memoirs, is of the Fox family, but he is not able to explain why the second part has so long lain unheeded and forgotten. The memoirs have certainly suffered in historical interest and value from this neglect of half a century, for memoirs of the period which lies between the death of Pitt and Fox and the return of the Whigs to power have, in the meantime, become numerous, so much so as to have deprived Lord Holland's volume of value except to students who are interested in the inner details of English party history. These *Further Memoirs* also lose much interest because they have come after and not before the Creevey Papers. Lord Holland and Creevey deal with the same period, and both from the Whig point of view, but Lord Holland's narrative of political events is tame indeed when compared with the piquancy and freshness of the Creevey Papers. The reason for this difference in value and interest is obvious when the two books are compared. It is extremely unlikely

that Creevey intended that his letters should be published. They are written with extraordinary freedom—with a freedom which would have made it necessary to defer their publication until many first-class funerals had taken place, even if it ever was Creevey's idea that they should be given to the public. Lord Holland, on the other hand, wrote his narrative twenty years after the incidents and episodes with which he deals had happened, and the unearthing of his memoirs is consequently no such find as the Creevey Papers. Many of his estimates of his contemporaries also, especially of George III. and of some members of his family, and of some of Holland's opponents in political life, are now out of date and harsh as well as valueless in the light of testimony which has come to hand in the sixty years which have intervened since Holland wrote.

**The High Road of Empire.** Water color and pen and ink sketches in India. By A. H. Hallam Murray. New York: E. P. Dutton & Co. \$5.00.

As a rule, when one finds a book so admirably illustrated—nearly fifty color sketches and over a hundred in black and white—one is apt to expect that the best of the pen and ink has already been expended—but this volume of Mr. Hallam Murray's is in no respect disappointing. One feels, after reading it, that one has passed some pleasant hours with a gentlemanly, well-informed companion, nowhere obtrusive, nowhere tiresome, nowhere pretentious. His journey seems to have been undertaken on behalf of *Murray's Handbook*, and in regard to India, and, we gather incidentally, to Australia and New Zealand, it is pleasant to feel certain that these old friends will keep up that reputation which their recent volumes on Palestine and Egypt have gone far to endanger. The guide-book element has been entirely excluded from the present volume. Mr. Murray nowhere labors after "doing the proper thing." He fearlessly admires the old town of Bombay, and finds Calcutta dull and conventional; he delights in Cyra, which one's Indian friends uniformly abuse. The pictures are delightful and ad-

mirably reproduced, and if any one calls the coloring "exaggerated" let him multiply it tenfold and then know that it is faint and pale beside the real East, which no pigment can set before us. It is almost ill-mannered to hint a fault in so pleasant a companion, and the transliteration of Oriental languages is, except for the scholar, much a matter of "taste and fancy," but the letters should at least represent the sound, and "Rhidmatjar" does not represent *Ritmagar*, nor "baingan" *batenjan*. The familiar red and green pottery of *Valauris* is not Oriental and it is not difficult to know that it should not be called "Valeria." Further, Mr. Hallam Murray is so enlightened a traveler that one is sorry he should perpetuate the old tourist and guide book error of speaking of "the Mosque of Omar over the rock of Abraham." Whether the Sakhra were really the scene of the sacrifice of Isaac who shall say, but the building over it is not a Mosque, and has nothing to do with Omar, who indeed made a very special point of saying his prayers elsewhere, lest it should be associated with his name. But this is all by the way. Mr. Murray is a delightful cicerone. The chapter on "The Windsor of the Great Mogul" is specially interesting. Few, even of those familiar with India, know anything of Fatehpur Sikri, the marvelous city, built in the sixteenth century, and shortly deserted on account of its unfavorable sanitary conditions, and which bears over its city gate the curiously appropriate motto:

"Said Jesus, on whom be peace, the world is a bridge;  
Pass over it, but build no house there."

**Mary of Modena: Her Life and Letters.** By Martin Haile. New York: E. P. Dutton & Co. Pp. xi, 523. \$4.00

However widely one may differ from Mr. Martin Haile's estimate of James II and his unfortunate second wife, it must be admitted that Mr. Haile's monograph on Queen Mary of Modena, is a distinct addition to the historical literature of the close of the Stuart era. Mr. Haile has one great qualification for writing the history of Queen Mary Beatrice. He has unlimited admiration and sympathy for his subject, and the

severe labor he has undergone in collating the materials for her biography has been to him a labor of love. There is but one shortcoming in the volume when once the point of view has been accepted. This is that there is no bibliography or list of authorities; and one can form an idea of the extent and thoroughness of Mr. Haile's research only from a careful reading of his book and a detailed noting of the authorities given in the margins. Mr. Haile has apparently founded his book largely on the Marchesa Campana de Cavelli's great work on "The Last Stuarts." This is a collection of an immense number of documents relating to James II., his Queen, and her two children, gathered from the archives of all the principal countries of Europe. The Marchesa published all these in their original Latin, Italian, French, German or English. Mr. Haile, where he has made use of the Marchesa's work, gives excellent translations instead of the original. Nor does he content himself with merely rounding out the work of a predecessor. He has supplemented the translations by going himself to the archives of Modena and the Vatican, and by numerous additional letters written by the Queen and now preserved among the Additional Manuscripts in the British Museum, and in other collections.

**Mrs. Brookfield and Her Circle.** By Charles and Frances Brookfield. 2 Vols. Pp. 554. New York: Chas. Scribner's Sons. \$7.00.

William Henry Brookfield, the husband of Mrs. Brookfield, of "Mrs. Brookfield and Her Circle," was the son of an attorney at Newcastle-on-Tyne. He was educated at Cambridge and became a fashionable preacher at proprietary chapels in London; a government inspector of schools; rector of Somersby, Lincolnshire; and toward the end of his career he was one of Queen Victoria's chaplains. Both Brookfield and his wife must have had many social qualities and no small share of the quick-wittedness and intellectuality which count for much in London society; and if the world at large—or such part of it as takes the trouble to read both these volumes—comes at first to the conclusion that Mr. and Mrs. Brookfield were eminently superior per-

sions, and intensely disliked social contact with people who were not their peers in wit and intelligence, the fault will lie with Mr. and Mrs. Charles Brookfield, who have prepared the diaries and letters for publication. The tone of the superior person, writing to another self-satisfied and superior person, runs thru many of the letters in the first volume; and this tone is never more apparent than when either Mr. or Mrs. Brookfield is writing of some unfortunate clergyman of the Church of England, who has voluntarily or involuntarily come for a brief period within his or her social hemisphere. There is more cupboard and kitchen stuff in the first of these two volumes than has appeared in any book—not a culinary guide—issued from the English press during the last five years. These drawbacks, however, characterize only the first volume. There is less kitchen stuff, less smart family slang, less ill-nature, and much less of the self-satisfied and superior in the second volume, which contains numerous really interesting letters, scores of good stories, and many glimpses into literary circles in London in the society days of Carlyle, Tennyson, Thackeray and Goldwin Smith, and some particularly good sketches of Hallam and Macaulay. There are fifteen portraits, all remarkably good; so good in fact as to give a value to the book in spite of the lack of judgment and good workmanship which characterize the editing.

**The Jewish Encyclopedia.** A Descriptive Record of the History, Religion, Literature and Customs of the Jewish People from the Earliest Times to the Present Day. Vol. XII. Large 8 vo. Pp. xiii, 708. Funk & Wagnalls Co. New York.

It is a great work which Funk & Wagnalls have achieved in completing this twelve-volume *Encyclopedia*, with over 16,000 articles and nearly 2,500 illustrations. Nothing has ever appeared before to compare with it in completeness. No effort has been spared to secure the help of the most competent scholars. The range has been of the widest, so that it would be difficult to mention a subject germane to Judaism that has not been treated. For the 605 collaborators the world has been ransacked, including

Rumanians, Moroccans and Egyptians. Volume XII is notable for articles of unusual Jewish interest, especially "Talmud," "Targum," "Temple," "Typography," "Theophany," "Tribes," "Torah," "United States" and "Zionism." As the several volumes have appeared we have commended them without stint, and have commended the work to libraries and scholars. That this *Encyclopedia* is well supported is proved by the names of nearly eight thousand subscribers printed in an appendix, full three-quarters of whom are in this country, a proof of the strength and prosperity of Jews in this country, and their interest in what concerns their race and history; for while Christian scholars and public libraries are among the subscribers, one can run along a hundred names in which every one is a Jew. Thus there are nearly two hundred, Levis, Levys and Levi-sons, and over a hundred Cahans, Cohens and Kohns. It is the backing of this racial patriotism which has brought the fine enterprise of the publishers to its successful and most creditable conclusion.

**A Little Sister of Destiny.** By Gelett Burgess. Boston: Houghton, Mifflin & Co. \$1 50.

"Miss Million was in New York for the first time in her life—she knew scarcely anyone but her lawyers—she was young, ardent, fanciful, rich—and it was spring. There's a spirited orchestra of the emotions for you!"

So much from the prelude of Mr. Gelett Burgess's book may give a taste of its quality, but it must be read by everyone who has a bit of the child-heart left in his mental anatomy. *A Little Sister of Destiny* is one of the most lovable books that has come to our table for many a long day. The way in which the "little sister of Destiny" is an assister to the various delightful people she finds just waiting a small push in a fortunate direction our readers will be glad not to be told until they, too, meet them all in the pages of a thoroly enjoyable and wholesome story.

**Social Theories and Social Facts.** By William Morton Grinnell. [Questions of the Day series.] New York: G. P. Putnam's Sons.

It is difficult to characterize this book. There is nothing to indicate that the

author conceived or wrote it in a spirit of levity; and yet to a reader of only average information in economics it cannot help but prove highly diverting. Its use of figures is naïve in the extreme, and the felicitous way in which it ignores all troublesome qualifications when drawing conclusions will prove interesting to the most jaded mind. The author evidently favors individual, independent effort, but is yet opposed to competition; favors the combination of capitalists, but inveighs savagely against the combination of workmen; to him the trust in particular industries is a very excellent thing, but the Socialistic trust of all industry a very wicked thing. It is impossible to find in the book a central idea or a consistent standpoint.

### Literary Notes

....Those who prefer to use the catechetical method of teaching will find the *Primer of Christian Doctrine*, by Dr. Milton S. Terry, of Garrett Biblical Institute, a convenient book for Bible classes and young people's societies. Its presentation of the teachings of the Bible is quite free from the traditional phraseology. (Eaton & Mains. New York. 30 cents.)

....Every one who is at all interested in Sunday Schools knows how much they owe to Henry Clay Trumbull, who was for nearly twenty-five years editor of *The Sunday School Times*. The interesting story of his life work as missionary, army chaplain, editor and author by Philip E. Howard, is published by *The Sunday School Times*. (Philadelphia, \$1.75.)

....A second edition of George Howell's *Labour Legislation, Labour Movements and Labour Leaders* is published by E. P. Dutton & Co., New York (two volumes, \$2.50). Mr. Howell is one of the best authorities on the subject of the labor movement in England, which, since the last election, is becoming of so much importance as to attract the attention of the whole world.

....The March number of the *Annals of the American Academy of Political and Social Science*, published by the Academy, Philadelphia, at \$1, is entirely devoted to the Child Labor problem. It contains about twenty articles covering all phases of the subject from such well known writers as A. J. McKelway, Jane Addams, Owen R. Lovejoy, John Graham Brooks, Florence Kelley, Samuel Gompers, Graham Taylor and William Noyes.

....*The Reader*, being published in Indianapolis, is evidently determined to prove that the literary activity of Indiana, so commonly alluded to in humorous columns of the press, is no joke. The May number of the magazine is devoted to Indiana writers. With Albert J.

Beveridge, William Vaughn Moody, James Whitcomb Riley, David Graham Phillips, George Ade, Meredith Nicholson, Alice Wood and both McCutcheons it makes a good showing for the State.

### Pebbles

"YES. He wooed his wife while crossing the ocean."

"You might say that he won his wife in a 'blue serge suit.'"—*Princeton Tiger*.

#### THIS GOT THE MONEY.

THERE may be art and science in answering advertisements, but, after all, qualifications cut a heap more ice, and this all-around man is said to have brought down the money. There is no significance to be attached to the liberal advertiser's initials, of course:

"WANTED—A young man for office; must be an experienced stenographer and typewriter, and able to correspond in English and German; salary to start, \$3 per week. Address H. O. G., 711 *The Ledger*."

"BIRD CENTER, October 18, 1904.

"H. O. G., 711 *The Ledger*:"

"DEAR SIR—I beg to offer myself as an applicant for the position advertised this morning. I am a young man, thirty-seven years of age, have had twenty-three years' business experience, being connected with the U. S. Embassy at Madagascar, and feel confident if you will give me a trial I can prove my worth to you.

"I am not only an expert bookkeeper, proficient stenographer and typewriter, excellent telegrapher and erudite college graduate, but have several other accomplishments, which may make me desirable. I am an experienced snow shoveler, a first-class peanut roaster, have some knowledge of removing superfluous hair and clipping puppy dogs' ears, and have a medal for reciting 'Curfew Shall Not Ring Tonight'; am a skillful chiropodist and a practical farmer; can cook, take care of horses, crease trousers, open oysters and repair umbrellas.

"Being possessed of great physical beauty, I would not only be useful, but would be ornamental as well, lending to the sacred precincts of your office that delightful charm that a Satsuma vase or a stuffed billy goat would. My whiskers being quite extensive and luxuriant, my face could be used for a penwiper and feather duster.

"I can furnish high recommendations from Chauncey Depew, Jacob J. Coxey, Kaiser Wilhelm der Grosse, Captain Clark, the Prime Minister of Dahomey and the Ahkoond of Swat.

"Can call any night after ten o'clock or can be seen Sunday morning in the loft of the church, Broad and Dock streets, where I am employed as first assistant organ blower and understudy to the janitor.

"Respectfully yours,

"SOCRATES MCGEE."

—*System*.

## The Beef Investigation

THE charges made by Mr. Upton Sinclair against the beef packers' methods, put into his novel, but vouched by him to be true, have been examined by two most admirable men selected by the President, and to the surprise of many people the muck rake is vindicated. The investigators were Charles P. Neill, Commissioner of Labor, a Johns Hopkins Ph.D. and former Professor of Political Economy in the Catholic University, and James B. Reynolds, for many years head worker of the University Settlement in this city, another equally competent man. They found things very nearly as bad as Mr. Sinclair had reported, and so they told the President; and now the President has told Speaker Cannon, who has gone over the evidence with Dr. Neill, and is satisfied that drastic legislation for supervision is necessary. The report of the two commissioners has not been compiled, but only given orally to the President, with the accompanying documents; but it should be made up and given to the public. When great companies in co-operation corner and control the food market the people have the right to know what is given them to eat. We should not have meat distributed for sale here which would be refused admission into Germany. It is no matter how foul the conditions are, we must know them, no matter whom they hurt, nor how many they disgust. We do not want to be reduced to the dietary restriction of the old English proverb that "Eggs, apples and nuts can be bought of sluts." Such facts as are indicated in the Neill-Reynolds report might make vegetarians of us, if the conditions described were necessary. But they are not. Only greed has created and maintained them.

There are some evils of business under concentrated control for which public ownership is the remedy. Such are the utilities that are natural monopolies, such as streets, railways, telegraphs and telephones. There are others in which competition is feasible, or should be if competition is free. Such are the sugar industry, the theater industry and the meat

industry. But monopoly has found the way to suppress competition. It simply crushes it by suffocation. Then it is likely to oppress the consumer, having first oppressed the rival producers. Now is the time for the Government to step in and correct the abuse. We are not yet ready to do this by the socializing of all industries; but we can insist that the public shall supervise all great and wealthy corporations that purvey for the public. The railroads shall give just and equal rates, and the meat sold to us shall be healthy and clean. The Beveridge bill, or one more stringent, should be speedily passed by Congress.

In this matter two men deserve great praise. The first is Mr. Sinclair, who went to Packingtown to live, and there studied the conditions, and brought them to the knowledge of the public. The other is the President. He may not have expected that the investigation would support Mr. Sinclair, but he saw that something ought to be done, and he has an uncommon faculty of seeing to it that what ought to be done is done. But for him Mr. Sinclair's assertions might have been regarded as the ravings of a wild magazinist eager for his penny-a-lining. And now the President and Mr. Sinclair are doing just what Harriet Beecher Stowe did fifty years ago. When they said her story of slave life was false, she published a "Key to Uncle Tom's Cabin," full of facts and data. That is what Mr. Sinclair is now doing effectively, and what Messrs. Neill and Reynolds are doing; and the public will have the advantage.

But we ask, Are there no pure and honest wealthy corporations? See what graft the head men of the Pennsylvania Railroad are confessing to. And the President of the Reading Railroad says that his is about the only honest railroad company.

## The Presbyterian Union

It is accomplished; the Northern Presbyterians and the Cumberland Presbyterians are again one. The two denominations have come together in the spirit

of mutually allowed liberty, and in corporate union.

Why were they ever divided? Simply because they were not willing to agree to differ in the same body. The Presbyterian Church was Calvinistic. It held strictly to those "Five Points," which we have so far forgotten that we have to look in a book to recall what they were. But certain men in the Church began to question decrees, and were passionate on free will. For this awful heresy they were compelled to leave; there was no room for such heretics. That was the day when the Arminian and Wesleyan heretics were questioning old formulas, very sacred formulas, and they said on both sides: "How can two walk together except they be agreed?" and so they separated. Just so, a few decades later, the New School Presbyterians were expelled from the same Presbyterian Church because they held that Christ's atonement was abundant and free for all; they would have nothing of a limited atonement.

The time came—not forty years later—when the New School Presbyterians were welcomed back to the fold from which they had been driven out; and now the Cumberland Presbyterians, after a longer banishment, are also received back to their old home, with great rejoicing. But neither one of these is the case of a prodigal son repenting. The son did not leave the father's house of his own accord. He was driven out, bidden to go and eat with swine; but he did not waste his substance with riotous living; he was diligent in business; he enlarged his possessions; he became rich and flourishing. Then it was the father that relented and repented. He was proud of his son; he begged him to return, and the son forgave his father, and they agreed again to live together as if nothing had happened, but on the basis of the liberty which had first been refused. This is the way that the New School Presbyterians came back over thirty years ago, and the way that the Cumberland Presbyterians return this happy year.

Just what, then, is the essence of the change which has made these unions possible? It is the new spirit, of something more than tolerance, of liberty of thought. The change has not been in the

excinded body, but in the excinding body. The Presbyterian Church has learned that liberty refused before must be granted now. What a pity that they ever refused it! They have had to go back on their record, and allow freedom of theologizing, at least to this extent.

Here, then, is the great lesson of this most honorable and happy union, and ever memorable, an example to other separated bodies. That lesson is, that union can be based only on liberty in the interpretation of scripture and in the methods of administration. The blunder of the Lambert Quadrilateral was that in place of liberty it put the "historic episcopate." That ended the matter; nobody could join them because they forbade liberty in organization. On this matter of essential liberty a very significant utterance is made by the editor of *The Christian Advocate*, of this city. He is discussing the Dean of Norwich at the Anglican Church Congress, in favor of union with the Wesleyans, and he says:

"Should the time ever come when the Church of England or its [Wesleyan] daughter can accept the ministers of other denominations, leaving them free to hold their own opinions of the whole question of orders, there may be a union, but never before."

There is the principle admitted and applied. The Southern Presbyterians have been unable to unite with their Northern brethren, because they insist that the latter must give up their liberty to speak their mind on such political matters as the right of secession. When two denominations think of uniting, the first and only difficulty that stands in the way is the insistence of either side that the other must do something in creed or polity. It is only when on both sides the spirit of Christian brotherhood seeks to enlarge the sphere of liberty that union is possible. We commend to all our Christian bodies the example of the frank and generous spirit of the Presbyterian Church in acknowledging its old error and holding out its hand to its too long estranged child; and the further example of the Cumberland Church, which has sunk its pride and yielded its separate and honored history, and returned to the fold from which it should never have been driven out. May this example find many to imitate it!

## Vanderbilt University

In June, 1905, the Board of Trust of Vanderbilt University rescinded a by-law which made all the bishops of the Methodist Church South *ex officio* members of it, eliminated eight bishops from its membership and kept five. This was done because the charter of the University restricts the board to thirty-three members, and if the approaching General Conference elected more bishops, it would then be composed of an illegal number.

This action was misinterpreted in some quarters as being personal, and resulted in the whole matter being brought before the General Conference, which recently met in Birmingham, Alabama. But no action was taken expressing disapproval of the board or requesting the reinstatement of those banished bishops, some of whom were present, by the way, when they were eliminated from the board and made no objection to the new arrangement.

The agitation, however, did result in bringing totally different questions before the General Conference, the settlement of which will powerfully affect the future of the University and of higher education generally in the South.

The first question is the general relation of the University to the Church. Some contend that it is owned and can be controlled directly by the General Conference. Others do not deny its historic relation to the Church, but they contend that it is a corporation whose rights and powers are defined by the laws of Tennessee, and whose affairs are and must be administered by its Board of Trust.

The second question is of the right of the College of Bishops under the original charter to act as a Board of Supervisors. The duties of these supervisors are not clearly defined in this charter. The bishops have never attempted to exercise any authority therein given, and it is held by eminent legal authorities who have investigated the charter that this provision is null and void and cannot be enforced.

On the other hand they who are dissatisfied with the present arrangement claim that if some of the bishops are to

be eliminated from the Board of Trust, all the bishops should organize as a Board of Supervisors and exercise whatever authority the charter gives them.

The General Conference having these matters laid before it, wisely decided that they were legal questions and that no final opinion could be given by any ecclesiastical tribunal. They were therefore referred to a commission consisting of five laymen, all of them prominent lawyers and members of the Southern Methodist Church. They are Judge Edward O'Rear, Frankfort, Ky.; Judge John A. Rich, Slater, Mo.; Judge E. D. Newman, Woodstock, Va.; Judge Joseph A. McCullough, Greenville, S. C., and the Hon. Creed Fulton Bates, Chattanooga, Tenn. The report of this commission is not to be submitted to the General Conference, but it is to be communicated directly to the Board of Trust and to the College of Bishops.

All this is of general interest, because it affords another illustration of the struggle so often seen where a growing educational institution undertakes to escape the cradle and granny system of the Church wherein it was born. Some desperate minded people imagine that it is an effort to escape from the fold of the Church herself into unimaginable heresies and what not. But the truth is there is nothing like the Church, any Church, for begetting schools and colleges, and there is nothing like a certain element in all churches for keeping them in leading strings.

However, when it is time for a thing to happen, it happens whether we believe in predestination or some other dogma. And the time had come in the history of Vanderbilt University when probably it was old enough to be weaned from, say eight of its nursing bishops. The office develops what may be called the episcopal temperament in some men, and tends too much toward the despotic exercise of authority; not that such a thing has ever happened in the history of Vanderbilt University, but with sixteen bishops on the Board of Trust there is no telling what might have happened. Thus, while it is evident that nothing was further from the intention of the trustees than to precipitate an issue between the jealous element already referred to in the

Church and the University, they did do it without realizing the import of their own action, and so were the humble instruments in the hand of Providence for unlocking a greater future for the institution. For, whatever the commission may decide, the issue has been made, and can never be settled except in accordance with the order and spirit of the times, which demand as much liberty for the intellectual conscience as the Puritans did for religious convictions, and with as much right for their contention. If only this old wife element in the Churches could realize that these young university men and women are more in earnest in their search after God and the very secrets of righteousness than any other have ever been, there would be less friction. As it is, the eternal conservatism of the past will always be in antagonism to that eternal energy in our children which makes every future more glorious than any past.

### “Organized” Democrats

AT Atlanta the other day, by the action of the State Democratic Executive Committee, another brand of partisan politics was created. In Georgia, as is well known, five men are seeking the nomination for Governor, the two leading candidates being Clark Howell, editor of the *Atlanta Constitution*, and Hoke Smith, former Secretary of the Interior. Clark Howell controls the machine, and Hoke Smith is endorsed by the Populists. It would appear that the State Committee, which is overwhelmingly pro-Howell, tried to hit upon some scheme by which to exclude the Populists from participation in the “white Democratic primary,” which is to be held August 22d, and which is tantamount to an election. They decided that the following caption must be put on every ticket voted:

“By voting this ticket I hereby declare that I am an organized Democrat, and I hereby pledge myself to support the organized Democracy, both State and National.”

The rules adopted by the committee provide that every ticket from which this caption is struck out shall be rejected in the count. To be sure, this ruse will not deter any very large number of Populists from voting in the “white Democratic

primary” in Georgia, for do not the Populists delight to call themselves Jeffersonian Democrats? And, from what we understand, politics is so warm in Georgia that the Populists would vote in the coming primary, even if they had to stultify themselves—and particularly so since this action on the part of Mr. Howell’s committee.

But what is amusing to an outsider is the new brand of Democrat evolved out of this five-cornered contest. It used to be sufficient to say: “I am a Democrat”; but the Georgians have changed all that; and hereafter every one who votes in that State at a white primary must swear as follows: “I am an *organized* Democrat.” A few years ago we remember that there were cataloged some thirty-nine different kinds of Democrats—but “Organized” was not among them. An “Organized Democrat” must be a distinctive variety, and we should be glad to see some Georgia solon’s explanation just how a local Democrat is to get himself or his organs organized.

More amusing than this is the evident desire on the part of the Democrats of Georgia, now that by the primary system the negro has been successfully eliminated, to disfranchise many thousands of white people as well. It does not appear that the present plan of the State Committee will accomplish that purpose, and we modestly suggest that if the committee would re-convene and decide that they themselves will nominate the Governor and other State House officers to be voted for on the first Wednesday in October, it would be a great saving of time, trouble and expense—provided, of course, every member of the committee could prove beyond the shadow of a shade of doubt that he has a right to the title of “Organized Democrat.”

### Nature’s Regenerative Power

THE report of a recent successful case of suture of the spinal cord with the patient on the road to recovery, presented before the New York Academy of Medicine at the beginning of the present month, illustrates the progress that has been made in the surgery of the nervous system in recent years, and calls special

attention to a chapter of surgical advance in which American surgeons have been the leaders. The patient was a young girl who had been shot in the abdomen by the accidental discharge of a revolver. The bullet passed thru the liver and then lodged in the muscles of the back, having inflicted an injury upon the spinal column. It was not thought at first that the spinal cord itself had been injured. The other wounds were treated by immediate surgical intervention, and the patient seemed to be well on the road to recovery when paralytic symptoms developed, showing that the spinal cord itself had been seriously injured. Emaciation set in at once, and it soon became evident that important nerve tracts had probably been divided by the course of the bullet. A secondary operation was done, and when the spinal canal was opened a distinct hole at one side of the cord was found. The edges of this were brought together and were sutured. After some weeks improvement in the paralytic symptoms set in and the trophic condition of the lower limbs began to improve. Within two months after the accident the young girl was able to walk, tho a little awkwardly, sensation and motion had returned to a remarkable degree, and as the improvement had been continuous there seemed to be every hope of practical complete recovery.

It is not so long since injuries of the nervous system were thought to be almost inevitably fatal. Injuries of the brain particularly were considered to be absolutely incompatible with subsequent prolongation of life for any length of time. A careful analysis of the wounds inflicted upon the brain by bullets during our Civil War, however, showed that there was almost no part of the brain proper that could not under certain circumstances be injured without fatal issue. Certain of the large ganglia at the base of the brain, if injured, always caused death: but these portions of the central nervous system, tho within the skull, belong almost more properly to the spinal cord than to the brain itself. The famous crowbar case, so frequently referred to, showed that a considerable portion of the brain substance might be carried away without producing a fatal result. In this case a good sized crowbar

driven by a premature blast passed completely through one side of the head, yet the victim survived in good health for many years afterward.

Injuries to the spinal cord, however, have been invariably considered, until very recent years, as pre-eminently serious and likely to be fatal. Tumors, it is true, have been removed from the spinal cord, and quite surprising recoveries of motion and sensation recorded after these functions had been lost for a long time. In these cases, however, it was generally considered that the nerve fibers had only been compressed, but had not really been seriously injured, and certainly had not been divided. A few years ago, however, a daring Philadelphia surgeon, finding a case in which the spinal cord had been divided by a knife wound, deliberately sutured the two parts, and, to his surprise, saw his patient gradually recover the use of the lower limbs and regain all the nervous functions that had been on the old supposition irrevocably lost. Other cases of like kind were then reported, until now nearly a dozen such marvelous recoveries are to be found in medical literature.

The operation has not lost its surprisingness as yet, because the old impression of the impossibility of the union of so highly organized a structure as the spinal cord seems to be the natural opinion. The recent case, however, illustrates very well that even the lacerating passage of a bullet, with the consequent loss of substance sure to occur in a structure so lacking in consistency as is the spinal cord, may yet be followed by very satisfactory recovery. It used to be set down as almost axiomatic that a serious injury of the spinal column itself, especially if it opened up the spongy substance of the bodies of the vertebra, was sure to be fatal. President Garfield's case was of this kind, and some of the best surgeons of the world declared that from the first his wound had been necessarily fatal and that only the highest skilled care had succeeded in prolonging his life. This recent case, however, illustrates that a much more serious wound may be successfully treated by modern surgical methods. It also emphasizes, contrary to anticipation, the supreme tolerance of the nervous system to injury. Infection

in the nervous system is sure to be fatal, but a clean wound of any kind may be followed by recovery. That American surgeons should have been able to demonstrate this to the world is a triumph of enterprise and progressiveness that must not be forgotten when there is question of what America has done for practical science.

### Educated Industrialism

THE inroads made by industrialism on education are so varied as to astound old time educators. Not content with a share of the curriculum, and a strong hold in the way of manual training, it is taking hold of the whole structure. Some of the States have been recently forming industrial clubs in connection with the schools. Illinois, Nebraska and Missouri have organized their boys for fruit growing and corn growing; while girls have their domestic science clubs; and both boys and girls have their school gardens and home gardens under school supervision. The specific nature of the work done is modified by locality. In some parts of Missouri strawberry growing is studied by the schools, and in other places we find that the culture of garden vegetables or truck gardening a specialty. The object is to give farm life a scientific outlook and at the same time associate agricultural work with such sciences as will make it profitable. The boys who engage in corn growing, as a study, are made familiar with the Holden method of seed selecting and with the latest competitive methods of increasing the average crop per acre. Gardening is exceedingly attractive to school children, because it is easily made to include experimenting—that is, cross breeding and the production of new varieties. Every child naturally loves the novel, and dislikes mere labor; that is, working in ruts.

In Pennsylvania a system of conferences has grown up between the grangers and the county school teachers. These meetings occur once a month in some of the counties. The topic of school gardens, which THE INDEPENDENT has not overlooked, has been discussed with strong commendation. Prizes have been offered for the best cultivated garden plots, and those yielding

the largest results in the way of crops. These plots are about twelve feet square for each pupil, and are either adjacent to the schoolhouse, or are parts of the home grounds; but in either case they are under the supervision of teachers as well as parents. This is an enlargement of the school garden idea, and a very good one, for it links the school to the home in a vital way. One serious trouble with the ordinary school is that its work is so sharply differentiated from home work and home life. The true ideal of the school is seen when it serves as a supplement to the home, and when both work together in the creation of men and women. The object of this new industrial movement is to get the whole population interested, the old as well as the young. The intent is not to have agriculture taught technically in the schools, but to have it encouraged. Nature study is to be applied, not merely enjoyed. New York State has the scheme of establishing home studies in agriculture by means of reading courses, conducted by the Cornell University Experiment Station. One of the most sterling books along this line is issued by the State Government, and should be generally distributed thruout the State. It is the most complete alliance between school life and home life that has ever been worked out. It covers sanitation as well as gardening, the esthetic features of the country home, as well as stock feeding, orcharding, dairying and marketing. This scheme of home studies and reading courses is supplemented by rural school conferences.

In the Southern States, industrialism is already the controlling feature of the public schools, as well as private institutes. How much of this is due to Tuskegee we need not decide; certain it is that the whites have gone under the influence of industrialism quite as surely as the blacks. America owes more than one good lesson to her black citizens. At Rollins College, in Florida, a classical institution of high rank, is found a domestic science department, co-operating with those industrial arts that pertain to agriculture and manufactures. Courses are offered in cooking, sewing and dress-making, as well as wood-carving, metal-working, furniture-making, basketry,

household decoration and mechanical drawing. This sounds, to one acquainted only with the old time curriculum, immensely like commercializing education; but what, after all is it, but the application of mathematics and the fine arts to everyday living? Why shall not good housekeeping and good husbandry and the wise use of land be taught to our common school pupils—certainly on a par with sociology, elocution, political economy, mathematics and the languages? It looks very much as if the South is going to forge ahead into leadership along educational lines, as it is rapidly going to the front with its factories and its farms, its peach orchards and its melon gardens.

Something more novel, possibly quite as fruitful for the future, is a scheme, already well established in Florida, to hold State fairs, or branches of such fairs for the boys and girls of the State. Such a fair was held at Jacksonville in 1904, and at Tampa, we believe, in 1905. Several hundred dollars were distributed in premiums each year, and all the work done under the supervision of the State Teachers' Association. Schools, as such, are encouraged to exhibit, altho the intent is to reach directly the individual pupil. Among the prizes awarded were those for essays on preservation of forests, on growing vegetables, on State improvement—in the way of canals, highways, etc.; as well as essays on cotton growing and fruit growing. Other essays are called for on How to Create a Public Sentiment for Enforcing Law, and Best Ways of Caring for Tourists; while plans for landscape gardening are specially encouraged. Specifically local industries, such as palmetto work, are not overlooked. Space will hardly allow anything more than a meager showing of this attempt to make young people rationally interested in good citizenship. The young Floridan is told that he must develop a comprehensive view of the life that he is born into. The school is made to be a part of the home, and education at the school is merged into home training. The boy is told that the Indian lost his homestead because of his very limited industrialism. The youth who is his successor, must understand that, only

as he comprehends his particular portion of the earth, and makes good use of it, can he make his footing sure; that a failure will cause another to step into his place. With the schools is assumed to rest the responsibility of inculcating this idea, if not of offering training in the practical affairs of every day life.

Meanwhile another scheme, of very wide import industrially, is winning its way, that of establishing County Normal Schools. This new system is found to identify teachers more closely with local interests. Each young teacher, before entering one of these normals, is obliged to pledge himself to teach three years at least in the rural schools. He is kept in close contact with the people and their domestic and industrial interests, especially of an agricultural sort. The country refuses any longer to accept teachers who lack every element of preparation for training boys and girls for the farm and for country homes. They must come charged with some sort of enthusiasm for Nature, if not with specific knowledge of agricultural work. The new system allows young teachers to practice for a while under competent supervision, before assuming control of a school. Beside this scheme, several of the States are establishing either county or Congressional district agricultural high schools. The difficulty with this scheme lies in its competition with the old common school system. It lays too heavy burdens upon the State, and brings about a clash where there should be alliance.

The proposition to identify our city parks with school grounds may or may not be advisable; it is strongly advocated by some of our best educators. The city school, like the country school, needs land and room for gardens. One thing is certain, we have got nearly through with school buildings plumped down on the highway, in the dust and the confusion of trade, and entirely alienated from Nature. The coming schoolhouse will have land on all sides of it, and will be industrialized, certainly to this extent, that it will apply book information as fast as acquired. It will educate hand and brain together, and will honor labor *per se*.

## Morning in June

THE clock has just struck three from the village church tower. Across the wide valley and beyond the villages and green hills the dawn begins to put out the stars. There are pink flushes, almost as unstable as the northern lights, that touch the cloud-film. The earth is still asleep, and there is not a sound among the farmhouses, except a mysterious policing wind, that shakes doors to see if all is safe. The water over the mill-dam is strong, for the miller has not needed it over night. The pink flush grows redder; the dawn breaks.

As far as the ear can hear one may distinguish a flute note in the east. It has for a while no accompaniment. Then the robin whose nest is by your window stirs the vines. You hear a rustle everywhere. Attention! The flute note is doubled and redoubled, and is drawing nearer and nearer. It comes steadily across the valley, in a growing volume of sweet sounds. Robins everywhere join in, no two singing exactly alike; but the chorus is grand. The valley is full of it. It rolls still nearer, like a great air wave; then it goes over you—over the houses, over the orchards and over the hills—westward; and it will roll on, a wave of song, to the limit of robin and human habitations—for they are one. There is nothing else like it in the world. Do we know how to greet the dawn? Reason and music must go together. It would not make less admirable our labors if we all stood out of doors at day-dawn and sang a great human chorus; the Golden Rule set to music. Would it not key us up to unselfishness and would it not make duty delightful?

It is four o'clock. In the valley orchards the cows stretch themselves, one after another rising from her mellow bed, while the dew still glistens on her hide. The farmer himself comes out to let down the bars, and his boys bring the pails for milk. A sweet odor, smelled at no other time, is filling the air. The sun is drinking dew, and the dew is full of clover and rose fragrance. Milking is a poem, if done where we can smell the clover and if the man be not a lout. We two, the cows and the folk, have been companions these many hundreds of years; but in early days it was the

woman who milked. The word *daughter*, or *duhitar*, means the milker—and we see no reason why it should not be milker still. Gladys at least is at the bars and ready to help in carrying the foaming pails to the house. There she will strain them carefully and set them in the broad pans for the cream.

The bees are abroad; and the village clock has struck five. The basswoods are in bloom. There is honey hid in every blossom, but you and I could not get it out. Who knows what else there is, that no one and no thing has ever found out? Some day nature will make somebody, or something, to see it and to use it. We walk among our hives with wonder that, wiser than we, the occupants have industries and industrial order that shames our human habitations and our municipalities. In one thing we easily lead—in our self-sufficiency; yet we are the most helpless of all creatures—taken alone. The cows and the bees, the apples and the cherries make up our civilization. As for our cities they are infinitely inferior, as a commonwealth, to that of the bees.

The sun looks down upon us now with a wonderfully conscious look. It is hard to escape the feeling that it is taking notes of the valley, and of the folk in the valley, and is inquiring as to our needs and our deeds. It does not find all things as it left the world last night. There has been a deal of growing and a good deal of mischief. It takes quick control and resumes mastery. The morning-glory opens; the hollyhock lets out the bee that it sheltered over night; the primrose, that dislikes the sun, shuts its eye; the hoya refuses to exhale odor, but the mock-orange is doubly sweet. The moths retire, but the butterflies go abroad. The night-world is a world by itself and it is beautiful. The day-world is also quite itself, with new obligations as well as new fragrances.

The housewife is spoiling the whole world with a batch of mixed odors that fly out of the kitchen. Nature is content with one sweetness, but the breakfast odor is a terrible combination. Frying grease is abhorrent to nature in every way. It makes that one great disaster—a dyspeptic stomach. The birds and the bees and the cows and the beetles do better. If left alone in their

choice of foods they select the wholesome; man is the only dyspeptic by his own choice. It is better to go without breakfast than to eat what is hastily scratched together into a frying pan. Our inventiveness is a terrible failure when the results have no fitness. We spend three-fourths of our time trying to digest messes, and mostly die in the attempt. A badly cooked egg cannot cheat the stomach. Nature made one mistake that she gave us so delicate an organism for digestion. There for once she failed to foresee the possibilities of hastily eating a hastily prepared meal.

The morning is over with; the horses are in harness for the day's work. The hay-cocks are tossed open already, and the delicious odor trolls its way over meadows and into the houses. The wagon has already started down the lane into the fields, and with strenuous lifts the laborers will toss the well cured grass onto the rack. All day load after load will dash off to the barn—in mid-summer anticipating winter. Prevenient man has this in his favor, that but for his forelooking the cattle and horses would find their zone essentially narrowed, and their existence possible in our Northern States only during summer. Living is a complex affair, and involves today the evolution of thousands of years of thinking. Did you ever consider how many years of experience go to make up the ordinary day of a farmer's life? He works out, between sunrise and sunset, as if a very simple matter, what it took thousands of years to invent, discover and put in shape.

Those who do not know the morning do not know the glory of life. He who is abroad at four o'clock looks in the eye of nature. One hour before eight o'clock is worth two after that. It is literally "the cream of the day." Get up early enough to be alone with the nature-soul. You will discover prayer in the garden; and you will no longer wonder that the ancients found spirits in the trees and the bushes, and gods in the glens and forests.

When Did  
Man Begin?

How long has man lived upon the earth? We do not know, but we are approaching a knowledge as to how long

man has lived in Denmark. The conditions there are very favorable to a conclusion. There has been a very slow and gradual elevation of the land above the sea. There are beach levels that are now 150 feet above the level of the sea, but were in the post-glacial period on the water line. In these beaches are found the most primitive remains, flint chips and scrapers. Then follow lower levels of beaches formed as the land arose, and later remains of peculiar ages. Professor Brogger, who has been carefully studying these successive remains, and the period of emergence of the land, concludes that the stone age, in its three epochs, reached from about 4900 B. C. to 1900 B. C., or about 3,000 years. Then came the bronze age, from 1900 to 500 B. C.; to be followed by the iron age. These figures are only tentative; and another archeologist, Sophus Müller, takes off nearly 2,000 years from this antiquity of the stone age. But on the other hand, it must be considered that Denmark was a sort of Ultima Thule, and men may have lived for thousands of years in favorable portions of Asia or Africa before they began to subsist on shell fish and create kitchen-middens in Denmark. The early history of man on the globe is the most fascinating and puzzling study in human history, and its methods are as purely geological as those used to study the period of the calamities of the carboniferous age or the later ichthyosaurs.

Interpreting  
the Creed

"I believe in God, the Father Almighty," is the way creeds begin, and the Apostles' Creed in particular. In all these creeds there is much, indeed most, that is true, and usually accepted. But there is also something that is not accepted as true. How shall those that will have a creed get over the inconsistency between their utterance and their faith? One of the best and most ingenious, as well as frankest ways, is that favored by one of the most distinguished Episcopal rectors in this city. He says, that when one repeats the Creed he must be understood to express, not precisely his own personal belief in the descent into hell, the resurrection of the body, etc., but the corporate expression of

faith, the view held by the Church as a whole, and which allows of individual variations. To be sure the Creed is individualistic and not corporate in its expression, "I believe," not *we* believe; and the old makers of creeds were so clear that they were to be accepted individually that they put in a clause that those who do not so believe are to perish everlastingly. But it is now intolerable to require clergy and communicants to repeat these creeds without some theory and policy of relief; and this may be as good as any. To be sure, it contradicts the text, but that is necessary in some way until the Church adopts some explanatory or exculpatory clause, which shall define the liberty of interpretation. Some Churches have wisely done this, and union of denominations has followed.

#### The Russian Crisis

Russia is in its very crisis. The people have spoken thru their Duma. They have made their demands, and those demands are but partially granted. The Council of Ministers, which stands as a buffer between the Duma and the Czar, accepts universal suffrage, but refuses the agrarian proposition and the general release of political prisoners. Thereupon the Duma reiterates its demand and requires the dismissal of the Ministry. But it does not itself dissolve, as would be done in Great Britain, and appeal to the country, for there is no knowing if the Government would allow a new election. It continues in existence, and will go thru the form of ruling, and formulate laws, and generally assert, and try to settle its legislative authority against the Czar and his Council. This is a most prudent course. Dissolution would mean anarchy and civil war with untold horrors. Indeed, this refusal to grant the demands of the people may be sufficient to fan the flame of revolution. The greatest danger now before Russia is in the provoked activity of the revolutionaries. We have renewed reports of assassinations, and only the wise and patient conduct of affairs by the Duma can avert terrible danger. Then a Czar would be no longer a luxury to be retained, and a Socialistic republic might be inaugurated.

#### Sponsors and Maids

It is forty years since our Civil War came to an end. Decoration Day will cease to be observed, as the new generation has less memory of the events which it celebrates. Already it has degenerated into a mere additional holiday, and few take part in the throwing of flowers on the graves. The old soldiers are fast falling, and the reunions of Union and Confederate soldiers cannot long continue. Nobody now celebrates the stirring events of the War of 1812, and all our patriotic celebrations will be merged in Independence Day. So the Sons and Daughters of the Civil War, on both sides, will before very long cease to think it worth while to meet, and will dwindle into mere old men's historical societies. Still, the Confederate veterans meet in State and National camps, but they are old and feeble, and they begin to find that they have not the strength and horseback glory to make the chief pageant. That has already passed into the hands of the second or third generation, and especially of the girls. Each little local Confederate camp has the right to send a "sponsor" young lady, and the "sponsors" and the "maids of honor," and the "Daughters" fill the platforms and the halls and hotels and homes; and the "Sons," and other people's sons, follow them, so that, in the courting, the old soldiers are quite a back number. We are informed that, in fear that the National reunions may lose their martial glory, it is likely that there will be held a final great Confederate reunion at Richmond, and that shall end it. The end must come soon, and it is as well that only State reunions shall continue a little longer, to which the physical strength of the veterans North or South may be equal, and which shall for a few years gather the tender and proud memories of the heroes of the Blue and Gray.

#### Mission Work Compared

In a French fortnightly, *Le Correspondant*, M. Piolet compares Protestant and Catholic foreign missionary results, much to the advantage of the latter. But his study tells him that Protestant missions are conducted much better than they were a generation ago, and this reform he takes to be the result of

the exposure of their blunders and shams by Marshall's "Christian Missions." Hardly; that book was one of the falsest shams ever written. M. Piolet says that the Protestant Christians in mission lands number about 2,000,000, while the Catholic baptized converts are 4,675,153. Their statistics seem to be more accurate in Pagan lands than they are in this country. It is to the everlasting credit of the Catholic Church that it entered upon the work of foreign missions before the Protestants did. While the Protestants were splitting up, in the seventeenth and eighteenth centuries, the Catholic Church established its great missions in India, China and Japan, as it had earlier in America. During the last fifty years the Protestants have gained rapidly, but they are still behind in numbers, and their belatedness is the chief reason. But we are interested in the first reason which M. Piolet gives (we quote from *The Catholic Fortnightly Review*):

"The first reason is the great diversity of beliefs, religious practices, interior organization, etc., which exists among the different Protestant mission societies. The Catholic missionary, on the contrary, everywhere teaches the same rites, inculcates the same moral code. Is there not here palpable evidence of the truth, and in the diversity, often the contradictoriness, of Protestant teaching, worship and precepts, at least an indication of error?"

If Protestants were late in the work of evangelism abroad, and later still in unity, they are now coming together by federation or organic union, and this very palpable evil will be relieved; and they are uniting faster in the mission fields than at home.

It was by a vote of 151 to 107 that the Southern Methodist General Convention has voted to join with the other branches of Methodism in the revision of their statement of faith. It was a great victory, for the Twenty-five Articles of the Methodist Church are antiquated in form and were built on a Calvinistic basis. There is not a specially Methodist statement among them. There is no statement of regeneration, nor of anything but the justice of God in the atonement—nothing of his love. Such an action indicates the progressive movement in Southern Methodism. The Methodists of Ja-

pan have reduced their Articles from twenty-five to eighteen. But the Conference was too conservative to change the four years' pastoral limit.

We cannot imagine that Dr. Henry Van Dyke, in speaking to the Presbyterian General Assembly in behalf of the California sufferers, really meant to add two verses to "America." He said that

"I love thy rocks and rills,  
Thy woods and templed hills,"

seems to locate the hymn in New England, and he suggested something for California:

"I love thy inland seas,  
Thy capes and giant trees,  
Thy rolling plains,  
Thy cañons wild and deep,  
Thy prairies' boundless sweep,  
Thy rocky mountains steep,  
Thy fertile mains.

"Thy domes, thy silvery strands,  
Thy Golden Gate that stands  
Afront the West.  
Thy sweet and crystal air,  
Thy sunlight everywhere,  
O land beyond compare,  
I love thee best."

California might have a special "America" of her own with this developed metrical encomium of her scenery; but really the "rocks and rills" and "templed hills" are not peculiar to New England. We remember that once Dr. Curry rebuked a colored school in Alabama for singing "America," telling them that "the Pilgrims' pride" was not theirs. They laughed.

As notable an utterance as any in the speeches at the dinner at Boston, in honor of the new Catholic Archbishop, O'Connell, was in that of the Irish Catholic Mayor Fitzgerald. Be it remembered that the majority of the voters of Boston are Catholics, and that Boston has a larger population of Irish birth or parentage than any other city in the world. Said the Mayor of Boston:

"The high reputation of the government of this Catholic city, compared with places like Cincinnati and Philadelphia, proves the mass of the Catholic people to be upright and clean in their political relations."

That is a high boast. Mayor Fitzgerald

might well make his own the lines of Boston's favorite Catholic poet:

*"Dies est prægélida  
Sinistra quum Bostonia,"*

which needs translation: "It is a very cold day when Boston gets left."

There was a small meeting in this city the other day of representatives and influential clergymen to press the proposition which has previously been suggested by Dr. George U. Wenner, of the Lutheran Church, that on Wednesday afternoons the public schools should be closed and the children taken to their respective churches to receive religious instruction at the expense of the Churches. This never will work. Half the parents will fail to direct their children to go to church, and they will simply get a half holiday, which is precisely what they do not need. Or it would be a pretty sight to see truant officers driving children to church. This is in the line of the Erastian infidelity which distrusts the Church and asks help from the State.

We have received from Mr. Wilbur F. Crafts the request that we join him in asking our readers to bombard the Senate with letters, telegrams and deputations to "persuade" the Senate Committee to report against allowing his seat to Mr. Smoot from Utah, and then to persuade the Senate to decide against him. We shall do no such thing. This is no case for persuasion, but for careful sifting of facts and constitutional right. Men or women have no more right to try to "persuade" Senators in this case than they would have to try to persuade a judge or jury in a murder trial.

Great Buddhist news is cabled from Tokio to the effect that a noted Buddhist priest who had gone to the United States on the invitation of wealthy Americans has already secured many converts, who have promised to build temples. We should not wonder. We can find many thousands here ready to believe anything that will make a claim; and the mistier and mustier it is with mystery and age the easier will adepts and disciples be

found who imagine they have acquired all ultimate truth.

In the House of Lords, as well as in the House of Commons disarmament has been proposed, and we may be pretty sure that it will at least be presented to the Hague Conference as a topic for consideration. It is coming sooner than we could have expected. When a Secretary of the Foreign Office says, in the House of Lords, that he does not see why disarmament should not be realized, we may hope something will be done toward it within ten years, or perhaps five.

Harvard University's bluff against football has been withdrawn, and the students are allowed to play with other institutions for this one year, to test the new rules. But President Eliot voted No, in a vote of the Board of Overseers of 15 to 9. It was inevitable that the board would recede, altho the excess of athletic rivalry is perhaps the worst evil connected with our colleges.

It is a new wrinkle, and not wholly a bad one, which the pastor of a Catholic church in New Rochelle, N. Y., has added to the conditions required before children can be admitted to their first communion. He requires that they must pass a written examination in the Creed, the Catechism and the Holy Eucharist. That assures part of the proper preparation.

The shade of Dr. McGlynn may be appeased! The new French Chamber of Deputies numbers among the re-elected l'Abbé Gayeaud and l'Abbé Lennie. The latter was opposed by his bishop, who, however, recognized the line of separation between religion and politics, and did not absolutely forbid his candidacy.

How the world moves! Ethiopia has entered into the Postal Union and has a vote in the Postal Congress at Rome, while China, which has not yet entered the Union, has no vote, and some people say that black folks cannot reach civilization. It is these Ethiopian Abyssinians that defeated the Italian army.

# Financial

## Mr. Fish and the Park Bank

At a meeting, last week, of the board of the National Park Bank, President Richard Delafield read a letter in which Stuyvesant Fish, president of the Illinois Central Railroad Company, resigned the office of vice-president of the bank, which he had held for many years. Mr. Fish said, in his letter, that he had been first elected to the office during the presidency of E. K. Wright. He continued as follows:

"During his administration, that of Mr. Poor, and a part of yours [President Delafield's] I was more than once, and for considerable periods, the sole Vice-President, and in that capacity gladly discharged such duties as fell to my lot.

"In recent years, since the election of others as active Vice-Presidents, there has really been nothing for me to do, and it is for that reason solely that I wish to withdraw. My relations with each and all of the members of the board, with each President from George H. Potts down, and particularly with yourself and our other Vice-Presidents, have been so cordial and so pleasant that I would not take this step did I not hope to continue with you and our other colleagues as a member of the board, in the firm expectation that those relations will always remain equally close and pleasant.

"I wish I had the time and the detailed information necessary to review what has happened since I was first elected as director of the bank in, I believe, 1882, and to contrast the present strength and prosperity of the bank under your wise and able management with some of the tight places through which even the Park had difficulty in carrying all of its customers in years gone by.

"My experiences as a director have impressed upon me two facts, the importance and value of which cannot be overestimated—first, that the Park is and has always been a commercial and not a financing bank; second, that its affairs have been and are directed, as the law requires, by the full board, every essential fact bearing on its business being brought on each Tuesday and Friday morning to the attention of all directors alike—for the continuance of which wise and sound practices no man deserves more credit than you."

Resolutions, proposed by Lewis Cass. Ledyard, and seconded by Cornelius Vanderbilt and Francis R. Appleton, were then unanimously adopted. They accepted the resignation of Mr. Fish and added the following commendation of his long and valuable service:

"The Board of Directors fully recognizes the reasonableness of Mr. Fish's wish to be relieved from the responsibility of an honorary

office to which, under the present organization of the bank, there are no longer active duties attached. In accepting his resignation as Vice-President his associate members of the board desire to record their appreciation of the earnestness, faithfulness and ability with which Mr. Fish has served the institution for so many years, and their recognition of the cordial and pleasant relations which have uniformly existed between him and all his colleagues. The board regards it as a matter of congratulation for itself and for the bank that Mr. Fish desires to continue his association with it and the institution by remaining as a director, in which capacity the bank will still have the advantage of his counsel and support."

Mr. Fish has been a director of this great commercial bank for substantially half of its life, for it was organized half a century ago. It has profited by his wise counsel, earnest interest, wide influence, and exceptional executive ability. He has seen it grow steadily in the esteem of the business community and in its resources, until now, with capital, surplus and undivided profits amounting to \$10,468,000, its deposits exceed \$92,000,000.

## United States Trust Company of New York

EDWARD W. SHELDON, who was recently elected president of the United States Trust Company, was born in Plainfield, N. J., in 1858, and was graduated from Princeton University in 1879 and from the Columbia College Law School in 1881. He was associate counsel of the United States Trust Company for six years and sole counsel for eighteen years before his election to the presidency. Mr. Sheldon has also been counsel for the Wisconsin Central Railroad, the Atlantic Coast Line and the Southern Express Company, and his election to the presidency of the United States Trust Company has met with general favor in financial and banking circles. D. Willis James, of Phelps, Dodge & Co., continues as vice-president, and the new second vice-president is William M. Kingsley, who has been identified with the banking house of Brown Brothers & Co. John A. Stewart, the president for so many years before ex-Secretary Gage, is chairman of the board of trustees. In addition to Edward W. Sheldon and

Payne Whitney, recently elected to the board, the trustees include such well known names as Samuel Sloan, John Harsen Rhoades, John Crosby Brown, W. Bayard Cutting, Charles S. Smith, William Rockefeller, Alexander E. Orr, William H. Macy, Jr., William D. Sloane, Gustav H. Schwab, Frank Lyman, George F. Vietor, James Stillman, John Claflin, John J. Phelps, John S. Kennedy, D. O. Mills, and Lewis Cass Ledyard. The capital of the United States Trust Company is \$2,000,000, and the surplus over \$12,000,000.

CHILE is borrowing \$12,500,000 for a new railway from Arica to La Paz (Bolivia) and \$18,500,000 for the construction of municipal drainage systems.

....Our output of anthracite coal in 1905 was 69,339,152 tons, valued at \$141,879,000. The number of men employed was 165,406.

....A concession for a railroad 80 miles long, beginning at Dawson, in the Klondike, has been granted by the Canadian Railway Commission. It is expected that 30 miles will be in operation within six months.

....President Corey, of the Steel Corporation, predicts a general substitution of steel ties for wooden ones on the railroads in the near future. In a letter to railroad presidents, he submits the results of the Corporation's inquiries and experiments, and asks for co-operation in solving the problems presented by the change which he believes to be at hand.

....The Metropolitan Bank, which recently absorbed the Shoe and Leather Bank, now has a capital of \$2,000,000, surplus and undivided profits of \$662,059.81, and total resources of \$14,091,038.57. The Shoe and Leather Branch will remain downtown, where stands the old Shoe and Leather Bank Building, and the Maiden Lane Branch will continue at No. 100 William street. The officers of the Metropolitan Bank are: Henry Ollesheimer, president; William M. Perkins, vice-president; Gilbert B. Sayres, second vice-president; Alfred J. McGrath, third vice-president; Augustus C. Corby, cashier; George L. Pegram, asst. cashier; James L. Miller, asst. cashier.

....E. F. Shanbacker, cashier, has recently been made first vice-president of the Fourth Street National Bank of Philadelphia, of which R. H. Rushton is president. Mr. Shanbacker has been connected with the bank seventeen years. He was formerly secretary to the president, then was promoted to be a collateral clerk. In 1898 he became assistant cashier, and three years later cashier. When first appointed cashier he was the youngest cashier of any bank in Philadelphia, and was regarded as one of the most efficient cashiers of any bank in the country. The other officers are: B. M. Faires, second vice-president; W. Z. McLearn, cashier. The capital of the Fourth Street National Bank is \$3,000,000, the surplus and net profits \$5,393,666.77, and the total resources \$49,327,362.58.

....The eighth annual edition of that excellent book of reference, *The Directory of Directors in the City of New York*, prepared and published by The Audit Company, has just come from the press. Its 1,017 pages contain the names of more than 24,000 directors or trustees (with addresses) alphabetically arranged, each director's name being followed by that of the firm or company with which he is most closely associated, and then by those of all the other companies of which he is a director; also selected lists of corporations in banking, insurance, transportation, manufacturing and other lines of business, accompanied by the names of their officers and directors. The past year's important changes in insurance and railway boards make some of the lists peculiarly interesting. In the offices of business men the book has become an indispensable part of the reference library.

....Dividends announced:

Atch., Top. & S. F. R'way (Convertible Gold Bonds), coupon payable June 1st.

Rubber Goods Mfg. Co. (Preferred), quarterly, 1¼ per cent., payable June 15th.

Internat'l Paper Co. (Preferred), quarterly, 1½ per cent., payable July 2d.

Am. Graphophone Co. (Common), quarterly, 1¼ per cent., payable June 15th.

Buff. & Susq. R. R. Co. (Preferred), quarterly, 1 per cent., payable June 1st.

Buff. & Susq. Iron Co. (1st Mort. 5s), coupon payable June 1st.

Iowa Central R'way (1st Mortgage), coupons payable June 1st.

# Insurance

## The Mutualization of the Equitable

THE announcement has been made that immediate steps are to be taken by those in control of the Equitable Life Assurance Society looking toward mutualization. It will be recalled that when, in June last, the stock control of this great company passed from James Hazen Hyde to Thomas F. Ryan it was understood and agreed to by the new purchaser that a plan of mutualization should be adopted as soon as practicable whereby the policy-holders were to be given the right to elect twenty-eight out of the fifty-two directors of the society.

This is the plan, outlined at the time of the passing of control from Hyde to Ryan, which the society's executives now seek to incorporate into an amended charter. This movement receives encouragement from the fact that it is sanctioned by the recent Armstrong legislation. It is likewise endorsed by Paul Morton, President of the Equitable Life Assurance Society, and by Grover Cleveland, chairman of the trustees. So far so good. Before the plan can be made operative there are, however, some obstacles to be overcome. For example, there is the injunction obtained by Franklin B. Lord, which, unless modified or dissolved, effectively restrains the society from carrying into effect the provisions of a former amended charter adopted about a year ago as the result of the efforts of James W. Alexander to effect a mutualization of the society along similar lines to those now proposed. The mutualization of the company is a desirable step. The company has been built up thru the agency of policy-holders and by means of the contributions they have made to the treasury of the company in the form of premiums paid. It seems but just and right, under the circumstances, that the effective control of the company belongs morally, if not legally, to the policy-holders rather than to stockholders, even if their dividends are limited to seven per cent. Inasmuch as the

society's charter must be amended to bring about the reform signified by a policy-holders' control, in the place of stock control, radical changes are required. But the Equitable must go much further than published reports indicate it intends to go. It must voluntarily or involuntarily come to the point of making the partial mutualization it contemplates full and complete. Partial mutualization is merely postponing the inevitable which must come; and its coming is made easier because of Mr. Ryan's offer to accept repayment of the purchase price paid by him, with four per cent. interest added. The society ought surely to be able to see the desirability of absolute stock retirement. A true mutualization is the only logical outcome of the present situation.

The insurance companies have been and still are in the limelight, and if a radical step such as we now suggest be voluntarily taken, in spite of the opposition of minority stockholders, it would go further toward inspiring confidence in the company taking it than anything that falls short of complete mutualization.

THE Mutual Reserve Life Insurance Company has ceased to do business in Great Britain.

It is estimated by glass manufacturers that more than \$1,000,000 worth of window glass was destroyed in San Francisco.

FOLLOWING the San Francisco disaster The Eagle Fire Company of New York, of which Theo. H. Price is president and William G. Whilden is secretary and managing underwriter, has increased its capital stock from \$300,000 to \$600,000, and the additional \$300,000 was immediately transferred to surplus account.

THE Connecticut Fire Insurance Company of Hartford, Conn., of which J. D. Browne is president, will increase its assets \$1,000,000 by means of reducing the present number of its outstanding shares from 10,000 to 5,000 at \$100 and then increasing the issue by the exact number retired at \$200.

## Survey of the World

### A Message With the Beef Report

After the Beveridge Meat Inspection bill (passed in the Senate as an amendment to the Agricultural Appropriation bill) was sent to the House, it was said that the packers would not oppose it. They said to the press, at Chicago, that they were heartily in favor of the regulations required by the bill, and of any inspection that would improve the condition of their industry. It soon became known, however, that an effort would be made in the House to substitute for the Beveridge bill a comparatively weak measure. Those most active in this movement were Representatives Lorimer and Madden, both of Chicago. It is commonly reported that Mr. Wadsworth (chairman of the Committee on Agriculture) and Speaker Cannon were more or less in sympathy with them. Mr. Roosevelt desired that the Beveridge bill should be accepted. He decided to publish the first part of the Neill-Reynolds report. On the 4th he sent it to Congress, accompanied by a message, at the beginning of which he said:

"This report is of a preliminary nature. I submit it to you now because it shows the urgent need of immediate action by the Congress in the direction of providing a drastic and thorough inspection by the Federal Government of all stockyards and packing houses and of their products, so far as the latter enter into interstate or foreign commerce. The conditions shown by even this short inspection to exist in the Chicago Stockyards are revolting. It is imperatively necessary in the interest of health and of decency that they should be radically changed. Under the existing law it is wholly impossible to secure satisfactory results."

The preliminary statements of an investigation made by the Bureau of Animal Industry, he continued, showed such defects in the law and such wholly

unexpected conditions that he deemed it best to have a further immediate investigation by men not connected with the bureau. It was impossible under the existing law for the bureau to do satisfactory work:

"The report shows that the stockyards and packing houses are not kept even reasonably clean, and that the method of handling and preparing food products is uncleanly and dangerous to health. Under existing law the national Government has no power to enforce inspection of the many forms of prepared meat food products that are daily going from the packing houses into interstate commerce. Owing to an inadequate appropriation the Department of Agriculture is not even able to place inspectors in all establishments desiring them. The present law prohibits the shipment of uninspected meat to foreign countries, but there is no provision forbidding the shipment of uninspected meats in interstate commerce, and thus the avenues of interstate commerce are left open to traffic in diseased or spoiled meats. If, as has been alleged on seemingly good authority, further evils exist, such as the improper use of chemicals and dyes, the Government lacks power to remedy them. A law is needed which will enable the inspectors of the general Government to inspect and supervise from the hoof to the can the preparation of the meat food product. The evil seems to be much less in the sale of dressed carcasses than in the sale of canned and other prepared products; and very much less as regards products sent abroad than as regards those used at home."

If the expense of the inspection is not paid by a fee levied on each animal slaughtered (a fee which, in no case, would exceed eight cents), the whole purpose of the law, Mr. Roosevelt says, can at any time be defeated thru an insufficient appropriation; "and whenever there was no particular public interest in the subject it would be not only easy, but natural, thus to make the appropriation insufficient." For this reason he opposes the payment of inspection expenses by the Government. The investigation, he says, is still unfinished:

"It is not yet possible to report on the alleged abuses in the use of deleterious chemical compounds in connection with canning and preserving meat products, nor on the alleged doctoring in this fashion of tainted meat and of products returned to the packers as having grown unsalable or unusable from age or from other reasons. Grave allegations are made in reference to abuses of this nature. Let me repeat that under the present law there is practically no method of stopping these abuses if they should be discovered to exist. Legislation is needed in order to prevent the possibility of all abuses in the future. If no legislation is passed, then the excellent results accomplished by the work of this special committee will endure only so long as the memory of the committee's work is fresh, and a recrudescence of the abuses is absolutely certain."

He asks for "the immediate enactment into law of provisions which will enable the Department of Agriculture adequately to inspect the meat and meat-food products entering into interstate commerce, and to supervise the methods of preparing the same, and to prescribe the sanitary conditions under which the work shall be performed." In conclusion he urges "the enactment of substantially the provisions known as the Beveridge amendment."

#### What the Two Investigators Saw

In the accompanying report, the investigators, James Bronson Reynolds and Charles P. Neill, say: "We have made no statement here as a fact that was not verified by our personal examination." The report is submitted as a partial, and not as a complete, one, touching upon those practices and conditions which were found most common, and not confined to a single house or class of houses. In the yards the pavement is of such a character that it cannot be properly cleaned. Its grooves are filled with manure and refuse. It is "slimy and malodorous when wet, yielding clouds of ill-smelling dust when dry." The interior finish of most of the buildings is wood. The floors are usually of wood, and many of them are "soaked and slimy." Very little attention has been paid to either light or ventilation. The workrooms, as a rule, are very poorly lighted. "Many inside rooms where food is prepared are without windows, deprived of sunlight and without direct communication with

the outside air. They may best be described as vaults in which the air rarely changes." There is no systematic ventilation. "Usually the workers toil without relief in a humid atmosphere heavy with the odors of rotten wood, decayed meats, stinking offal, and entrails." The tables on which meat is handled, the tubs, and other receptacles are generally of wood. Only one porcelain-lined receptacle was seen. The wooden receptacles are frequently water-soaked and only half cleaned. Nothing, say the investigators, shows more strikingly the general indifference to cleanliness and sanitation than the privies, which, as a rule, are sections of workrooms, inclosed by thin wooden partitions. They usually ventilate into the workrooms. In them there is frequently an entire absence of lavatory provisions. (Here we must refer our readers to the text of the report for a description of the abominable practices of employees and of disgusting conditions due to lack of sanitary conveniences.) Even a large plant erected within recent years has most of the defects of the older structures. "No model building for the preparation of food products has been erected in the stock yards of Chicago." Messrs. Reynolds and Neill describe at length an establishment in New York, where the admirable conditions furnish an impressive contrast. Such regard for sanitation and for the health and cleanliness of the workers, they say, would revolutionize the Chicago packing plants. "Under existing conditions," they add, the burden of protecting the meat products in the latter city, and of preserving the health of workers there, "must fall upon the national Government."

#### How Meat Is Handled

Turning to the handling of meat, the investigators assert that "an absence of cleanliness was found everywhere" in this work after the carcasses, or parts of them, leave the cooling room. Sides sent to the boning room are thrown in heaps on the floor. Workers climb over these heaps, selecting the pieces they wish, and frequently throw them on the dirty floor. While cutting the meat, they hold it against their aprons, which are, as a rule,

"indescribably filthy," bearing long accumulated grease and dirt. With shoes soiled with the refuse of the floors, they even stand on the meat tables. Meat scraps which are to be chopped are shoveled up from the dirty floors:

"These floors, it must be noted, were in most cases damp and soggy, in dark, ill ventilated rooms, and the employees in utter ignorance of cleanliness or danger to health expectorated at will upon them. In a word, we saw meat shoveled from filthy wooden floors, piled on tables rarely washed, pushed from room to room in rotten box carts, in all of which processes it was in the way of gathering dirt, splinters, floor filth, and the expectoration of tuberculous and other diseased workers. Where comment was made to floor superintendents about these matters, it was always the reply that this meat would afterward be cooked, and that this sterilization would prevent any danger from its use. Even this, it may be pointed out in passing, is not wholly true. A very considerable portion of the meat so handled is sent out as smoked products and in the form of sausages, which are prepared to be eaten without being cooked."

A glaring instance of uncleanness was found in the room where sausage of the best grade was being prepared "for export," to be eaten uncooked. The carts were filthy, the workmen and their clothes were dirty, and there was no water in the room. The men tried to clean their hands by rubbing them against their "dirty aprons or still filthier trousers." The investigators saw the carcass of a hog, just washed, fall to the dirty floor and slide part way into a filthy privy. It was then hung up with other carcasses, "no effort being made to clean it." Inspection as practiced now does not go far enough, the investigators say, being confined to the healthfulness of animals when they are killed; there is no inspection during all the processes of preparing sausage, canned products, etc., altho these products, when sent out, bear labels stating that they have been passed upon by Government inspectors. (The report concerning the use of dyes, preservatives or chemicals is not yet ready.) In one well known establishment the investigators saw a long table covered with several hundred pounds of cooked scraps of beef and other meats:

"Some of these meat scraps were dry, leathery, and unfit to be eaten; and in the heap were found pieces of pigskin and even bits of rope strands and other rubbish. Inquiry evoked the frank admission from the man in

charge that this was to be ground up and used in making 'potted ham.'"

All these canned products bear labels saying that the contents have been inspected by the Government. This is deceptive and untrue. Under the head of the treatment of employees, it is asserted that the superintendents seem to ignore all considerations except those of the account book:

"The unsanitary conditions in which the laborers work, and the feverish pace which they are forced to maintain, inevitably affect their health. Physicians state that tuberculosis is disproportionately prevalent in the stockyards, and the victims of this disease expectorate on the spongy wooden floors of the dark work-rooms, from which falling scraps of meat are later shoveled up to be converted into food products. Even the ordinary decencies of life are completely ignored."

Here the investigators take up again the subject of toilet rooms, describing at length the highly objectionable character of these places and of the adjoining lunch rooms. Women and girls are employed in unventilated places, where the temperature is kept at 38 degrees F., and where the floors are covered with water.

"The whole situation as we saw it in these huge establishments tends necessarily and inevitably to the moral degradation of thousands of workers, who are forced to spend their working hours under conditions that are entirely unnecessary and unpardonable, and which are a constant menace not only to their own health, but to the health of those who use the food products prepared by them."

Inspection of animals before slaughter, the investigators say, is of minor importance and should be permissive; inspection immediately after slaughter (now permissive) should be compulsory. They make many recommendations for legislation. These were embodied in the Beveridge amendment. The most important of them provide for official examination of all meat products (intended for interstate commerce) at any stage of their care or treatment, and for sanitary regulations in packers' buildings.

#### The Railroad Rate Bill

On Saturday last the conferees finished their work on the Railroad Rate bill and made a report. Nearly all of the amendments added by the Senate are more severe. Thus, in the amendment forbidding the issue of passes, all of the

Senate's exceptions for the benefit of certain classes of passengers are cut out. No one is excepted, not even a railroad employee, and the penalty for either giving or receiving a pass (in interstate traffic) is \$1,000. Sleeping car companies are taken out of the bill. Express companies and pipe line companies remain where they were placed by the Senate. In the amendment forbidding the transportation of commodities owned by the railroad companies, the exception admitting lumber is revoked. The number of Commissioners is increased to seven, and the salary is raised from \$7,500 to \$10,000. What the reporters called the "Jim Crow" amendment, requiring "equal accommodation for equal passenger rates," has been dropped. Mr. Foraker and Mr. Warner were the authors of it. Many protests against this provision were received from negroes in the North, who held that it would invite the use of cars exclusively for negroes in the Northern States as well as in the South. Mr. Tillman insisted upon the retention of it until, it is said, he yielded to save the provision requiring five days' notice for temporary injunctions.—The Government wins its suit against the Refrigerator Transit Company and several railroad companies (among them the Erie and the Rock Island) by the decision of four Circuit Court Judges at Milwaukee. The first of these defendants was a private car company, which received a commission (or really a rebate) of 10 or 12 per cent. upon the freight of the Pabst Brewing Company, the disposition of which it controlled. It is enjoined from receiving, and the railroads from giving, such rebates. The decision is under the Elkins Act, and is an important one, because it clearly makes unlawful this device, as well as many other similar devices, for getting around the statute against rebates. Commissions paid by railroads to freight brokers are included.

#### Isthmian Canal Questions

The Aldrich joint resolution, providing that supplies for the canal shall be purchased in the home market unless the President deems the prices extortionate or unreasonable, was passed in the Senate last week by a party vote

(39 to 16), except that Mr. Teller stood with the Republicans. Amendments permitting purchases to be made abroad if prices are lower there (and one allowing the purchase of American products abroad if the prices are lower than at home) were rejected. For all these Mr. La Follette voted with the Democrats. Among the Democratic tariff speeches was one by Mr. Stone, who remarked that the President would surely buy at home, owing to "the influence of the men who contributed the stupendous slush funds to carry the last three Presidential elections." He also asserted that the President, about a year ago, after "thundering in the index" about making purchases abroad, had surrendered and paid Trust prices, buying two ships at \$1,300,000, altho two foreign ships of the same class had been offered to him at \$750,000, thus proving himself, in Mr. Stone's opinion, "no iron man at all, but merely a pine lath painted the color of iron." Mr. Teller referred to Chairman Shonts's recent public speeches in favor of greater expedition in canal construction, saying that if Mr. Shonts were really concerned about this, it would be more consistent for him to go to the Isthmus and stay there. (It is reported that Mr. Shonts's resignation is in the President's hands.)—Complaint is made that the recent repeal of the eight-hour law, so far as foreign laborers are concerned, was not sufficient, because it still affects all the foremen, engineers and others who direct the laborers. The latter do little or nothing after the hours of their superiors have expired. Complete repeal of the law, so far as the Canal Zone is concerned, is opposed by the labor unions.—The Panama municipal council has adopted resolutions soliciting the intervention of the United States in the interest of a free ballot at the coming elections, asserting that already, by unjust arrests, intimidation and the destruction of voters' lists, the Government is preparing for elections that will be "daringly illegal." The "Columbia," with 400 marines, has arrived at Colon.—Guatemala has been invaded by large parties of well-armed revolutionists, entering at four points on the border, and commanded by ex-President Barrillas, General Castillo, General Toledo and General Pineda. In their attempt to

overthrow President Cabrera, these leaders are said to have considerable assistance from Salvador, Honduras and Nicaragua.

#### Washington Notes

Arthur Pue Gorman, for many years a Senator from Maryland, died at his home in Washington on the 4th of heart disease, in his sixty - eighth year. He had been ill for several months.— On the same day, Senator Joseph R. Burton, of Kansas, under sentence for a criminal offense, resigned, and Foster D. Coburn was appointed in his place.— Robert Adams, Jr., Representative from the Second District of Pennsylvania, and formerly Minister to Brazil, committed suicide in Washington on the 1st, owing to heavy losses in speculation.—In the Supreme Court, last week, Attorney-General Moody brought up the case of the lynching of Edward Johnson, a negro, at Chattanooga, on March 19th, when he was in the custody of that court, which had granted him an appeal. Upon information submitted by Mr. Moody the court ordered twenty-six citizens of Chattanooga to appear before it on October 15 and show cause why they should not be punished for contempt. Among these citizens are John F. Shipp, sheriff of the county, and eight of his deputies.—By a vote of 7 to 5 the Senate Committee on Elections has declared that Reed Smoot is not entitled to his seat as a Senator from Utah. Messrs. Burrows, Dolliver, Pettus, Overman, Bailey, Dubois and Frazier voted in the affirmative; in the negative were Messrs. Foraker, Dillingham, Hopkins, Beveridge and Knox. The vote of Mr. Depew was not cast.—The bill removing the tax from denatured alcohol was passed in the House, with the Senate amendments, last week, and sent to the President for his approval.

#### Riots in Northern Mexico

Much excitement was caused on the southwestern border last Friday by riots at Cananea, in Mexico, where the extensive works of the Greene Consolidated Copper Company are situated. Cananea has a population of

23,000 (including 5,000 Americans), and is forty miles south of Naco, Ariz. About 5,000 Mexican employees of the mining company went on strike and attacked the Americans, having made an unsuccessful demand for an increase of their wages from \$3.50 to \$5 per day. On the first day of the disturbance, many Americans took refuge in the house of Colonel W. C. Greene (president of the company) and the Presbyterian Church. Two Americans and eleven Mexicans were killed and valuable property was destroyed. Governor Ysabel, of the State of Sonora, took the extraordinary step of appealing to our Government at Washington for help, but four companies of cavalry on the way were checked at the boundary by Secretary Taft. At the Governor's request an armed posse of 450 from Bisbee, Ariz., accompanied him to Cananea, from which alarming stories of massacre had been received. They were not permitted, however, to do anything, control of the mob having been obtained by the Mexican mounted police under Colonel Kosterlitzky. It is reported that the latter formally executed eight prominent strikers, asserting that they were revolutionists. Our ambassador at Mexico was told by the Mexican Government that the disturbance was due to the efforts of a revolutionist junta at St. Louis. Colonel Greene says it was caused by a Socialist organization formed by opponents of the Diaz Government. Others see in the riots only an expression of race hatred and the effect of rum on a pay day.

#### The Philippine Islands

In northern and central Luzon the number of those affected by fanatical religious movements increases. There are now said to be 80,000 persons who sympathize with the fanatical outlaws. An armed party of these marauders, however, rarely exceeds sixty men. They have been attacking towns and even kidnapping local officers. In southern Luzon, ladrones are again making trouble. At a point only ten miles from Manila the constabulary, last week, attacked a band of fifty, driving them back to the hills.—It is not expected that action will

be taken in the Senate upon the Philippine Tariff bill which was passed by the House. After a rehearing, the Supreme Court repeats its former decision that the tariff duties collected in the islands under executive order, previous to October 25th, 1901, were collected unlawfully and must be refunded. The amount was about \$4,000,000, which was expended in the administration of Philippine affairs.—One of the Filipino students sent to this country by the Government has taken the first prize at the University of Illinois for excellence in military drill, and another has won the fencing championship at the Drexel Institute.

### The Marriage of the King of Spain

The wedding festivities in Madrid were suddenly chilled by an attempt to assassinate the King and Queen of Spain as they returned to the royal palace after their marriage at the Church of San Jeronimo May 31st. The day was a beautiful one and the streets were thronged with over a million spectators, provincials, citizens and foreigners. The wedding procession, which started from the royal palace at half past nine in the morning, was made especially interesting by the display of troops of the various regiments and royal guards in their historic uniforms. The nineteen curious gala coaches of the lords and ladies of the court were each drawn by eight white horses caparisoned in gold and silver. These were followed by the twenty-two state coaches, with two horses, containing the grandees of Spain, who are allowed to remain covered in the royal presence. The crown coach, in which were King Alfonso and the heir to the throne, the nine year old Don Alfonso, was drawn by eight white mules without riders, and escorted by the King's ancient bodyguard of halberdiers. Following was the dainty coach of mahogany and glass bearing the Princess Ena of Battenberg and the Queen-Mother, Maria Christina. The streets were gorgeously decorated with triumphal arches, columns and banks of red and yellow roses, and every night were lighted and adorned by hundreds of thousands of electric lights of all colors

and powers. The church was illuminated for the ceremony by powerful arc lights and clusters of incandescent lights in the form of orange blossoms on the cornices. The historic attendants of the Spanish Kings, mace bearers, heralds, major domos, masters of horse and gentlemen in waiting, Knights of the Golden Fleece and ecclesiastics, by the splendor and variety of their costumes, made a scene of exceptional brilliancy and interest. Senators, deputies, the diplomatic corps and special envoys were assigned to particular tribunes. Frederick W. Whitridge, the special envoy of the United States, had received marked attention by the King and officials, and had been favored by assignment to the Pigna-Hermosa Palace, which had been elaborately decorated in his honor. It was generally felt that the sending and reception of the special embassy marked the official reconciliation of the two countries. The marriage ceremony was performed by Cardinal Sancha, Archbishop of Toledo, and concluded with the blessing invoked upon King Alfonso XIII and Queen Victoria by the nuncio of the Pope. As the royal coach containing the King and Queen rode back thru the streets amid the ringing of bells and the salvos of artillery, they were greeted with the heartiest cheers from the crowds on the streets, the grand stands and the balconies, who threw roses in their path. But as they passed the Governor's house in the Calle Major, no great distance from the palace, a bomb, wrapped in roses, was thrown from the balcony of the house opposite No. 88, which struck directly in front of the carriage containing the royal couple, and exploded with terrific violence. Twenty-four persons were instantly killed or fatally wounded, and over eighty were seriously injured. Men and horses, guards and spectators, were literally torn in pieces, and fragments of flesh and clothing strewed the street and were thrown up against the buildings on each side. The King's life was saved by a mere accident. The assassin had slightly miscalculated his aim or his missile had struck an electric light wire below the balcony. The windows of the carriage were shattered and a fragment of the bomb actually struck the breast of the King, and would have inflicted a

wound if it had not been for the chain of Portuguese Order of Santiago which he wore and which was broken. The King manifested great coolness and self-control as he escorted his bride to another carriage and tried to calm her hysterical sobs. As she walked across the bloody streets and passed the corpses her white slippers and the wedding dress that has been so often described in the newspapers were spattered and stained with red. As they entered the castle the King exclaimed: "Why did I bring you to this country? It was wrong." In reply to congratulations on his escape he said: "Yes, fortunately it was unsuccessful, but it will come again. It may be any time, perhaps within a year, but it will come." It was just a year before that King Alfonso narrowly escaped death from a bomb thrown at him as he was riding with President Loubet thru the streets of Paris.

#### **The Assassin and His Victims**

In the room of No. 88 Calle Mayor, from which the bomb had been thrown, were found expensive toilet articles and clothing, cans of chemicals, from which the bomb had been filled just previous to using it, and a blood stained handkerchief, indicating that the assassin had cut his hand in hastily filling it. The house belongs to the Dowager Queen Christina. The room and balcony had been rented at a high price for the occasion by an unknown man, who escaped in the confusion. All anarchists known to the police were speedily arrested, but the guilty man was discovered in the village of Torrejon de Ardos, a half dozen miles from Madrid, on the road to Alcala, where he expected to take a train to Barcelona. He was dressed in a workman's suit, but his language, well kept hands and gentlemanly manner aroused the suspicions of the villagers. While waiting for the train he entered a cheap inn and ordered a meal, which he did not eat. The innkeeper's wife, in talking to him about the attempt on the life of the King, denounced it as an awful crime, at which the stranger answered, "Every one has his own opinion, and it should be respected." A watch-

man noticed that one finger of his left hand was wounded, and that he corresponded to the description of the man who had rented the balcony, so he intercepted him as he left the inn and started into the country. Instantly he drew a revolver and shot the guard dead and ran up the road, but when he saw he was surrounded by the villagers he turned his revolver against himself and fell shot thru the heart. He proved to be Manuel Morales, son of a rich manufacturer of Sabadell, near Barcelona, who had disowned him and driven him from his home on account of his morose disposition. He had been sent to Germany to study textile production and had become imbued with anarchistic ideas, devoting himself to the study of chemistry, and getting his living by teaching languages and translating chemical works. It is possible that he was the man who attempted to assassinate the King in Paris a year ago, as the police were never able to find the thrower of that bomb. There are many things to indicate that the plot was hatched in London. Great Britain has always refused to join with other nations in a concerted attempt to suppress anarchism, but now that an English princess has been attacked the attitude of the Government may change. British anarchists explain that by becoming Queen of Spain she forfeited any right to immunity on the ground of the protection given by the British Government to the political refugees of foreign lands. The 13 officers and soldiers who were killed by the bomb were given a public funeral, the procession passing thru the same streets as the wedding party, where the garlands, festoons and flags offered a striking contrast with the black coaches. The relatives of the slain walked together behind the hearses—Ministers of State and generals with workingmen and peasants. The Marchioness of Colosa and her daughter, aged fourteen, and Don Antonio Calvo and his six-year-old niece were among those killed by the bomb. The King has visited the wounded and granted pensions to the families of those who suffered loss. It was thought better not to make any change in the program, so the spectacles and entertainments have been continued, both

the King and Queen being driven thru the streets in carriages and automobiles without escort. The bull fight was attended by an audience of 60,000 persons. The Queen was present with the King, but the British Embassy remained away.

#### The Work of the Duma

The Cabinet and the Duma continue to act without any regard to the existence and rights of each other. The resolution of lack of confidence in the Cabinet passed by the Duma, which in any other European nation would have necessarily caused its resignation, was contemptuously ignored, Premier Goremykin explaining that the dismissal of the Government was out of the province of the Duma, and so could not be considered. The Minister of Agriculture explains that the Government expects to solve the agrarian question by providing to the use of the peasants such land as is available without resorting to expropriation. The Government already has at its disposal 25,000,000 acres, composed of 10,000,000 acres of Crown arable land, largely in the Volga region; 6,250,000 acres of forests, and 8,750,000 acres of private estates, the owners of which have announced their readiness to sell. These lands and such as can be purchased at reasonable prices from other landowners will be sold to the peasants on long time. Besides this, extensive colonization plans in Siberia and Central Asia and the improvement of the agricultural methods of the peasantry, are relied upon by the Government to solve the agrarian question. The Duma holds these measures to be altogether inadequate, and demands the expropriation of the estates of the large landowners. There is, however, a wide difference of opinion as to the disposal of the land so acquired, some holding that the private ownership of land is the only way to develop more efficient agriculture, and others, among whom are most of the peasants, demand the abolition of private ownership of land. A bill supported by 111 members was introduced, declaring the equality before the law of all citizens, without distinction of nationality, sex or religion. On receipt of news that the court-martial at Riga had condemned to death eight workmen

for the assassination of Police Lieutenant Porzhitsk, the Government was interpellated regarding it. Before a reply had been received, however, from the Minister of War, the revolutionists had been executed. This action created the greatest indignation in the Duma, and a bill was at once introduced for the abolition of the death penalty. The peasant members of the Duma are grievously disappointed by the failure to accomplish any practical results so far. Several of them are sick, and one of them is said to have died of grief and chagrin. The famine is still spreading, and twenty-two provinces are affected, and millions of peasants are in danger of starvation. The Government is doing very little to relieve the suffering and refuses to allow any organized private relief. The distress is greater than that which prevailed in 1892.

This is a new cry that "Massenaustritt" is heard from various quarters of the Protestant churches in Germany, pleading for a severance *en masse* of the members from the State churches. It is heard only in the liberal circles and is directed against what seems to be the too conservative tendencies of the Church authorities. This is notably the case in Prussia, where a new school law, giving the Church considerable control over the schools, has called forth this cry in order to punish the State for its positive proclivities. This movement is headed by the famous religico-social agitator, Paul Goehre, formerly himself a pastor; but is discouraged by the leading liberal organ of the Church, the *Christlich Welt*, of Marburg. In university circles a similar movement is at work, but so far only one member of a university faculty has openly severed his connection with the Church. Rather singularly, the common schools, too, are made the scene of this propaganda, appeals to refuse religious instruction being sent to thousands of children thru the mails. Hitherto, such an agitation has been spasmodically but never successfully undertaken by the Social Democrats; the present movement comes largely from within the Church itself.

# Quail Shooting

BY GROVER CLEVELAND

EX-PRESIDENT OF THE UNITED STATES.

WE hear a great deal in these days about abundant physical exercise as a necessary factor in the maintenance of sound health and vigor. This is so universally and persistently enjoined upon us by those whose studies and efforts are devoted to our bodily welfare that frequently if we withhold an iota of belief concerning any detail of the proposition we subject our-

selves to the accusation of recklessly discrediting the laws of health.

While beyond all doubt a wholesale denial of the importance of physical exertion to a desirable condition of bodily strength would savor of foolish hardihood we are by no means obliged to concede that mere activity of muscles without accompaniment constitutes the exercise best calculated to do us good. In

This picture of Mr. Cleveland's home at Princeton, and the portraits of Mr. Cleveland on the following pages were taken last week by a representative of THE INDEPENDENT especially to accompany this article on quail shooting.

Mr. Cleveland and His Setter on the Steps of His Princeton Home.

point of fact we are only boldly honest and sincere when we insist that really beneficial exercise consists as much in the pursuit of some independent object we desire to reach or gain by physical exertion, coupled with a pleasant stimulation of mental interest and recreation, as in any given kind or degree of mere muscular activity. Bodily movement alone undertaken from a sense of duty or upon medical advice is among the dreary and unsatisfying things of life. It may cultivate or increase animal strength and endurance, but it is apt at the same time to weaken and distort the disposition and temper. The medicine is not only distasteful, but fails in efficacy unless it is mingled with the agreeable and healing ingredients of mental recreation and desirable objects of endeavor.

I am convinced that nothing meets all the requirements of rational, healthful outdoor exercise more completely than quail shooting. It seems to be so compounded of wholesome things that it reaches, with vitalizing effect, every point of mental or physical enervation. Under the prohibitions of the law, or the restraints of sporting decency, or both, it is only permitted at a season of the year when nature freely dispenses to those who submit to her treatment, the potent tonic of cool and bracing air and the invigorating influences of fields and trees and sky, no longer vexed by summer heat. It invites early rising; and as a general rule a successful search for these uncertain birds involves long miles of travel on foot. Obviously this sport furnishes an abundance of muscular action and physically strengthening surroundings. These, fortunately, are supplemented by the eager alertness essential to the discovery and capture of game well worth the effort, and by the recreative and self-satisfying complacency of more or less skilful shooting.

In addition to all this, the quail shooter has on his excursions a companion who not only promotes his success, but whose manner of contributing to it is a constant source of delight. I am not speaking of human companionship, which frequently mars pleasure by insistent competition or awkward interference, but of the companionship of a faithful, devoted helper, never discour-

aged or discontented with his allotted service, except when the man behind the gun shoots badly, and always dumbly willing to concede to the shooter the entire credit of a successful hunt. The work in the field of a well trained dog is of itself an exhibition well worth the fatigue of a quailing expedition. It behooves the hunter, however, to remember that the dog is in the field for business, and that no amount of sentimental admiration of his performances on the part of his master will compensate him, if, after he has found and indicated the location of the game, it escapes thru inattention or bad shooting at the critical instant. The careless or bungling shooter who repeatedly misses all manner of fair shots, must not be surprised if in utter disgust his dog companion sulkily ceases effort, or even wholly abandons the field, leaving the chagrined and disappointed hunter to return home alone—leg weary, gameless and ashamed. He is thus forced to learn that hunting dog intelligence is not limited to abject subservience; and he thus gains a new appreciation of the fact that the better his dog, the better the shooter must know "what to do with his gun."

I do not assume to be competent to give instruction in quail shooting. I miss too often to undertake such a rôle. It may not, however, be entirely unprofitable to mention a fault which I suppose to be somewhat common among those who have not reached the point of satisfactory skill, and which my experience has taught me will stand in the way of success as long as it remains uncorrected. I refer to the instinctive and difficultly controlled impulse to shoot too quickly when the bird rises. The flight seems to be much more speedy than it really is; and the undrilled shooter, if he has any idea in his mind at all, is dominated by the fear that if the formality of aiming his gun is observed the game will be beyond range before he shoots. This leads to a nervous, flustered pointing of the gun in the direction of the bird's flight, and its discharge at such close range that the load of shot hardly separates in the intervening distance. Nine times out of ten the result is, of course, a complete miss; and if the bird should at any time under these conditions be ac-

Mr. Cleveland and His Gun in His Library at Princeton.

Mr. Cleveland on the Porch of His Princeton Home.

identally hit, it would be difficult to find its scattered fragments. An old quail shooter once advised a younger one afflicted with this sort of quick triggeritis: "When the bird gets up, if you chew tobacco spit over your shoulder before you shoot."

It is absolutely certain that he who aspires to do good quail shooting must keep cool; and it is just as certain that he must trust the carrying qualities of his gun as well as his own ability and the intelligence of his dog. If he observes these rules, experience and practice will do the rest.

I hope I may be allowed to suggest that both those who appreciate the table qualities of the toothsome quail, and those who know the keen enjoyment and health giving results of their pursuit, should recognize it as quite worth their while, and as a matter of duty to co-operate in every movement having for its object the protection, preservation and propagation of this game. Our quail have many natural enemies; they are often decimated by the severity of winter, and there are human beings so degraded and so lost to shame as to seek their destruction in ways most foul. A covey of quail will sometimes huddle as close together as possible in a circle, with their heads turned outward. I have

heard of men who, discovering them in this situation, have fired upon them, killing every one at a single shot. There ought to be a law which would consign one guilty of this crime to prison for a comfortable term of years. A story is told of a man so stupidly unsportsman-like that when he was interfered with as he raised his gun apparently to shoot a quail running on the ground, he exclaimed with irritation: "I did not intend to shoot until it had stopped running." This may be called innocent stupidity; but there is no place for such a man among sportsmen, and he is certainly out of place among quail.

It is cause for congratulation that so much has been done for quail protection and preservation thru the enactment of laws for that purpose. But neither these nor their perfunctory enforcement will be sufficiently effective. There must be, in addition, an active sentiment aroused in support of more advanced game legislation, and willing voluntary service in aid of its enforcement; and in the meantime all belonging to the sporting fraternity should teach that genuine sportsmanship is based upon honor, generosity, obedience to law and a scrupulous willingness to perpetuate for those who come after them the outdoor recreation they themselves enjoy.

PRINCETON, N. J.

## The Wild Bird's Song

BY M. E. AUDUBON

[Miss Audubon is a granddaughter of the famous ornithologist.—EDITOR.]

He sang as tho his little throat  
Was overflowing with the song;  
As only those can sing who know  
Naught of this human world of wrong!  
As none but those to whom proud man  
Has given the name of "dumb things" can.

He sang as I would fain, to God—  
The plaudits of the listening crowd,  
Their flatteries, their beck and nod,  
They called not forth this anthem loud,  
So bright, so glad, so wild and free—  
Yet only Heaven heard—and me.

He perched on a wild rose-bush, so near,  
I could have touched the other side,  
He plumed his wings, and once again  
Poured forth his praises far and wide.  
Oh, very near he brought me then  
To the dear Lord of birds and men!

A moment more, and he had soared  
Far up into the ether blue.  
As tho he sought the home of God,  
Higher and higher still, he flew.  
While to my heart the evening breeze  
Whispered: "If God so cares for these  
How careth He for you?"

NEW HAVEN, CONN.

## THE ADVANCE OF THE AUTOMOBILE

*by Augustus Post*

*Chairman of the Touring Committee of the American Automobile Association.*

**G**REAT progress has been made during the last year by the motor car. The luxury of design and the perfection of detail in engineering construction leave little to desire.

Having passed its infancy and critical stages, it is taking the rapid strides of youth forward in every direction, especially in this country.

The most marked development has oc-

Motor Ambulance in the Red Cross Service.

curved in the direction of the commercial vehicle, and the boundary line between it and the pleasure car is now clearly defined; its construction is now adapted to the use for which it is intended.

Another direction, almost the opposite, that shows the solidity of the industry, is the use of the motor car by the armies of the world. All of them have used it for the convenience of staff officers, and there have lately been completed in both France

roads. President Underwood, of the Erie Railroad, has also introduced the automobile into the field of railway transportation. The adoption of the gasoline motor of the automobile type is certain to be a great factor in connection with the multiple unit system of operation.

The most notable advance, which places the automobile in a class by itself and has almost placed the speed creation outside of the boundaries of the ordinary motor

Motor Truck.

and Austria armored automobiles mounted with rapid fire machine guns which seem quite practical. Our own army, too, has built a motor ambulance which promises to be a great boon to the injured.

There has been some use of the automobile on railroad tracks, and Mr. Charles J. Glidden, who was the first to cross the western part of this continent on the rails, with special flanged wheels fitted to his car, has used this same equipment in his travels through Burmah, in the Far East, where there are no wagon

car, is the wonderful performances of the racing cars at Ormond Beach. A mile in 28 1-5 seconds and two miles actually covered in less than a minute is more than the average comprehension can grasp. From the Flatiron Building to the Waldorf in less time than it takes an ordinary person to cross Fifth avenue. From New York to Boston in barely two hours, Philadelphia in the time it takes to go to Harlem, and to Europe in a day! We are calmly assured by the men who calculated to produce this speed, and did,

Resting on the Side of the Road.

In the Heart of the Quebec Forests.

Boys' Ingenuity Trolley Car. Runs by Gravity from House to Track, with Bell, Fare Register, and All.

Dinner in Sight.

that they can construct a machine to make a mile in 25 seconds.

Let us look at another achievement of equal, if not greater, importance. Several economy tests have shown the cost of operation to be very low indeed, one motor omnibus carrying sixteen passengers for less than one-half cent per mile and a runabout for slightly less than this figure. With all the items charged, including interest, depreciation and repairs, a profit can be shown over railroad transportation cost, where the highway is improved and suited to travel in all kinds of weather. The one factor that will bring "good roads" in this country is the automobile, and the commercial car will do more than anything else to hasten their construction; if it was the locomotive which diverted money and attention from this most important public work, it will be the motor car, or the engine freed from the bondage of the rails, that will turn the forces back again, and we will have the most perfect highways that can be built. There is one fear, however, and it is a growing one, and that is the prevalence of special legislation. This new method of transportation is different and requires different treatment, we must admit; whether it demands special roads or not, or special division of the roads, time alone can tell, but it looks very much like it just now. If sufficient slow

speed passenger cars or load carrying vehicles are used to show a benefit to the public it may counteract the high speed touring cars, which serve to stir up a great deal of animosity, and raise clouds of dust, which, it is claimed, may be more of a nuisance than the mere speed itself.

With almost double the number of automobiles in this country now than in all Europe and an output of more than 30,000 cars a year and this number increasing rapidly, with the immense amount of money invested both in the automobiles themselves and in the factories, the number of people employed, and the strength of the organizations which serve to direct this vast influence, the automobile is one of the political powers of the present; and it surely will rival the power of the combined railroad influence in the future. We may look to it to furnish cheap parcel delivery, as the express companies and the railroads prevent the postal service from granting this; if the proper roads and motor vehicles exist, there is then no reason why we should not have motor express companies, as they do in Detroit, and ultimately have this system extended.

Let us harness and put to good use the rampant creature of the inventor's brain before it injures itself, and as much pleasure and health as we have had, let us have equal service and gain.

NEW YORK CITY.

## A Sensible Vacation

BY CHARLOTTE PERKINS GILMAN

AUTHOR OF "THE HOME," "HUMAN WORK," ETC.

IT seems as if this earth was planned especially for vacations, there is so much land suitable for them—beaches and mountains, and such inexhaustible water. You can't plow beaches and mountains; and the forestry commission is going to overtake the lumberman soon and save us the forests on the hills.

Even where you have the hills without the forests they are good for vaca-

tions; just as high and stimulating—even more breezy—and with better views.

No matter what we do to the earth, using all the arable and irrigable land, these blessed wastes remain to us, wastes as to agricultural return, but rich beyond measure as limitless reservoirs of health, strength and deep, lasting inspiration.

So there is space, and there will con-

time to be space, for all of us to spend our vacations. Time, strangely enough, seems less plenty; yet that is only a passing obsession. Already we have learned that the advance in mechanical science enables us to do all the present work of the world in a few hours a day, and rationally arranged labor will give us substitutes, alternates and understudies enough to leave every living soul a long vacation. Two or three months of the year, taken in a lump or at intervals—this will be open to all who desire it without loss or inconvenience to any one. A true vacation ought to be in the widest sense a reversion—a return to primitive conditions. As the elaborate convolutions of social advance thicken about us; as we become with the swift decades more perfectly specialized to our several forms of social service, and more insistently conscious of the thrilling complex about us, so for a real rest and Antæus-like recuperation we must go back to Mother Earth with full abandon.

The eminent statesman who goes fishing or duck shooting or seeking bigger game; the business man who loves a sailboat and the wide, rolling emptiness of the sea, are wise in their vacations; they rest the brain and use the muscles to the gain of both. To a farm worker or professional fisherman quite the opposite would be of service. Let them have theirs in winter; leave the white meadows and gray rocks for the city; go to picture gallery and concert and theater; rest the muscles and stimulate the brain. It is easy to arrange sensible vacations for men in any business; but what is a sensible vacation for a woman?

She cannot revert—there is nothing to revert to. Of course she could change the cook stove for the camp fire, the sewing machine for the bone needle; but that would merely change the tools; the work would be the same.

The "society women," so called (meaning her who has apparently no faintest inkling of the existence of society, our human whole), may find her vacation in camping out; that furnishes a change for her, and the green woods

Walking.

; Angling.

have rest for all of us; but to the ordinary working housewife—fifteen-sixteenths of our women—camp life does not appeal.

What they need is indicated by the way they flock together in our hundreds of "Chautauquas" and summer schools of this and that branch of study; they want association, information and inspiration, some glimpse at least, if not a share of, the large activities of life.

As to children—school children—they want freedom and fresh air; nothing else matters much. Under such differing conditions as these it is difficult to plan a sensible vacation for a family altogether; and perhaps that is not really necessary—perhaps they are all mutually rested by being apart for a little while.

An ideal possibility would be a comfortable farm, adjoining woods or water for the men on one side, and a flourishing summer school on the other; so that father could go off with gun or fishing

rod, mother with note book and program, and the children stay in the clean pastures and just play. While situations like these are not open to us in any numbers, we must consider what can be done by average people as things are today, with average salaries to depend on.

For children the summer camp, or walking trip, under competent care, is better far than the summer boarding house. If the existing camps are too expensive a group of families, friends and equals, could have one for their combined children; engaging some nurse and guardian of their acquaintance. It would not be an expensive matter to rent an upland pasture with a good brook and some woodland; put up a few tents, take a wagon load of supplies, and arrange for milk with the nearest farm. Or, if tents are distrusted, hire an empty farmhouse; there are

Tenting.

Copyright, 1906, Brown Bros., New York City.

many such; or simply engage rooms in two or three adjacent ones, a responsible person to each houseful of children, and insurance against mischief guaranteed. To give the children a summer party, comparatively free from "grown ups," would be good for them; and almost the only plan to give the mothers a vacation. If, however, the mothers object, or there are babies who cannot be left; there is little for that sort of family but the usual summer boarder existence, with a commuting husband over Sunday, or every day

if the place is sufficiently near.

This is sensible enough—practical enough; it is what most people who can afford vacations at all do now; but it leaves much to be desired. Can we do no better? For all those who have no children, for young people, or parents whose children have grown up, or bachelors, maid and man, or childless couples there is wider range.

If the man can go too, there are no limits but the purse.

A canoe trip—there are level waterways in abundance about here; a steam launch trip, going far and fast; a canal-boat going the other way; a catboat flitting along the edges of the Sound; plenty of water and ways of following it. These are open to men and women, and could include a child or two of suitable age.

But the one cheapest, easiest, most variable and healthful proposition is the walking trip. The timid and housebound may arrange it to go from town to town, sleeping in hotels like other folks; but the intrepid wayfarer will take a little knapsack with a rubber blanket atop and live in the open. Say you have only a fortnight to spend and only \$15 apiece to cover it. Arrange the trip to stop at towns for supplies; carry lunch and cook at little camp fires where possible; take an occasional meal at a farmhouse, and hire a night's lodging when it rains—barn preferred.

That could be done with every variation; from a lazy journey in the near-by open country, with a hired bed when it was wanted, to a well stocked knapsack, most of the money spent getting there—

and a real walking trip in the Catskills. Take the boat to Kingston or Catskill and *walk up*; then go on thru to any point chosen and come back by rail—that would be a trip to remember. (If this section is chosen take an umbrella.)

The thing to do is to begin right away and make one's plans; that is the best part of most things—planning them. Many of our railroads furnish excellent maps with their time tables, and the Government topographical maps are but five cents apiece. (Address the Director of United States Geological Survey, Washington, D. C.) These give contour lines, elevations, roads and brooks in detail; a delight to the searcher.

One can buy maps of the whole country around New York in this fine detail for twenty-five cents, and get the railroad circulars for nothing; then arrange times, distances and expenses beforehand.

Few vacation exercises are more satisfying than a walking trip. Do you tire easily? There is nothing to prevent your resting a whole lazy afternoon in the prettiest place you can find. But each

day you can walk a little farther; it becomes a joy instead of a labor, and the wholesome weariness is exactly what you need. It means sleep, such sleep as you haven't had for years; it means digestion like a prairie fire—devouring all before it; and assimilation such as never comes to the housebound.

A pleasant arrangement would be for two who loved rowing to take a boat with supplies, and two who loved walking to follow the bank while the boat rowed up or down some pleasant river. They  could take turns and vary the exercise. Or a group could hire a stout horse and wagon for the trip, load in the needfuls, and ride a bit when they were tired. A horse walks no faster than a man usually; or, if he does, has no objection to waiting.

A family, emulating the old emigrants to California, could hire a covered vehicle big enough to sleep in, buy food for the horse at farmhouses, and spend the whole fortnight out of doors—more if they had it.

A farm wagon and stout country horse

Canoeing.

are wanted; no city livery prices. In one case I heard of a man bought a wagon and pair of horses for the trip, and sold the outfit afterward for fifty dollars more than he paid for them. An extremely sensible vacation that. The

bicycle is a cheap steed to those who enjoy it; carries some luggage; and in any country but Holland will insure enough walking for all practical purposes.

It is a wonder that such cheap out of door trips are not enjoyed more freely; but with us in America the summer outing is mainly for women and children; and it is hard to arrange for such undertakings alone.

But why "alone" after all? Since the manless family does not really stay alone, but must needs be in some group, for mutual dependence and convenience, why not pick one's group and arrange for a compound vacation with the maximum of ease and relaxation and the minimum of labor and expense?

Suppose we take ten pleasant families, friends all, and see what they could do for a summer if they pooled their funds.

As it is they will go separately to summer cottages, hotels or farms; each with a nurse maid for the children if they can afford it (and scant rest for the mothers if they can't), and pay, severally, some \$35 a week, including the nurse and her wages, or \$25 without. This is a very modest estimate: \$8 for the mother, \$15 for the three children and \$2 for the week-end father. Stay—I forgot the washing; \$2 more. So we have a minimum of \$27 a week, which for ten families is \$270, and for thirteen weeks is \$3,510. Here we have forty persons to provide for; the ten husbands for two days a week making it an average of forty-three persons, whose food, at \$2.50 a week per capita, would cost \$107.50  $\times$  13 = \$1,397.50. The service necessary should be about as follows: Cook, \$30 a month; kitchen maid, \$20; two maids at \$25 each = \$50; two laundresses the same, \$50; manager, \$30; man, \$20; in all \$200 a month in wages  $\times$  3 = \$600. The food of these at the same rate as above would be \$260 more, making \$860 for labor for the season. This, added to the amount for food for the families, makes

\$2,257.50, and when we subtract this from the total expense amount of \$3,510 it leaves \$1,252.50 for lodging. That sum would hire a pleasant summer boarding house or group of little cottages, and thus these friends would be assured of pleasant company, good food and plenty of room.

Except for the co-operative feature the thing is done all over our country; on the coast of both oceans, along inland lakes, in the green woods we have these tiny transient summer homes. But that particular feature is just what makes the difference to the women. For them there is small change between doing housework in a house or in a tent, except that the house has more conveniences.

If an arrangement could be made by which the tired housewife could have all the care and labor of the home lifted from her without separation from her beloved ones; if she could see the children at play under wise and loving supervision and feel easy to leave them for long restful hours; if they were all assured of pure, wholesome food without any care or trouble, this would be a new life to overworked women. What would a man think if he were expected to enjoy his holiday while taking his work with him? Set up his desk under a tree, carry the care of the business night and day, have no change but the change of surroundings.

The real rest requires absolute change, and that is why the woman likes to "board" in summer. Poor as the accommodations often are, unsatisfactory as the food may be, still she has no care, and that rests her.

A good investment for a small capital would be the laying out of such little groups of summer cottages as here suggested; a pretty bit of ground, good water, dry, clean little dwellings, pretty but cheap; one especially for children, with a delightful playground; and one with the cooking plant and a wide, cool, partly out of door dining room. Adjoining the cooking room would be the laundry, for convenience of heating and water supply; and one house for the little group of employees, to work easy hours and enjoy

themselves also. A counter near the kitchen would allow people to buy cooked food, picnic lunches, all excursion supplies; and there we should have it, the maximum of health and pleasure, the minimum of expense.

Each tiny cottage should have its porch and porch roof to be slept on by wise residents; and the common ground would have space for games.

Now suppose our ten families, who now spend the \$3,510 annually, should form themselves into a little summer

Then the "business end" of the affair, the guest house, with the power plant at the back—kitchen and laundry, the big dining and dancing hall and accommodation for twenty guests. This could be built and furnished in the same simple way for about \$2,500. For about \$7,000 the whole place could be outfitted, with a margin of \$3,000 for the always unlooked for extras, including a pair of horses and a stout wagon.

The twenty guests, at \$6 a week, would net the establishment about \$800

Camping.

home corporation and borrow \$10,000 at 5 per cent. This would be \$50 a year to each family.

Let them buy ten or twenty acres of high rocky woodland—plenty of such land to be had at \$10 an acre in our hilly regions; and to put this patch in order, provide water, etc., we will allow in all \$500.

Ten little wooden shanties could be put up and sparsely furnished for \$300 each—\$3,000.

One more for the children, and one for the help, these larger, \$800 for the two.

—pay the interest, taxes and repairs. Then in eight years the summer home corporation could pay back its principal and proceed to have a summer income instead of summer expenses!

These estimates are on the plainest of board buildings, and insure "the simple life"; but that is what a vacation should provide.

The whole place could be artistically planned; the tiny houses show a Japanese restraint and simplicity; but there could be excellent food, good beds, pure water and wood for the fires which are so de-

strable in our mountains even in summer. Shower baths could be set up; just the plain pipe and "rose" in a narrow box; a bath house adjoining the laundry. If there was no good place for tennis, why tether ball is cheaper and most exhilarating.

Attractions would vary in different places; but any little group of people could do in a small way for themselves what other people do in a showy way for the mere money making there is in it.

In our country we have come to recognize the vacation as a necessary part of life for a large proportion of the people; and their number increases yearly.

The demand is met at present by the "summer resorts" of all descriptions; but more and more people are beginning to want the "real country," and to value a country home above the most magnificent hotel.

The country home is only for the rich so far; but people of much smaller means could have one if they would learn the power of combination.

Those who have the talent for planning and arranging, for building and managing, could find pleasure and profit in these summer settlements for people of moderate means; and there would be occupation in the necessary labor of the place for many now out of work in summer; competent working women who are employed by the rich in their winter homes in the city and left stranded when they go away.

Another century should see us developing all manner of pleasant, flexible, far reaching arrangements by which all of us—every citizen, both young and old—may be assured their needed holiday.

NEW YORK CITY.

## Wild-Goose Ways\*

BY WILLIAM J. LONG

AUTHOR OF "SECRETS OF THE WOODS," "NORTHERN TRAILS," ETC.

TO understand a wild goose two things are necessary, luck and a good disposition—luck to find him at home and a disposition to lay aside one's gun and prejudices and to see with an open mind. If happily these two pleasant things have ever fallen to your lot, you no longer call a person a goose, unless you mean to pay him an unusual compliment, and you no longer speak of a wild goose chase as the symbol of a useless and hopeless quest; for among all the birds there is none that so readily responds to your advances and none that so abundantly repays you for your time and trouble. Indeed, for the man who has followed Waptonk only with a gun, to kill him, or only with his longing eyes—as the high flying wedge harrows the blue heavens, and a wild trumpet clangor

comes crackling down to set human nerves a tingle—there are chiefly surprises in store as he gets really acquainted with this wild wanderer.

It was largely this element of surprise that led me, when luck came to me on the desolate barrens of the far North, to forsake the salmon rivers, which I had come to fish, and the caribou, which I had come to follow, and hide and watch by the lonely little ponds where Waptonk and his mate were training their fuzzy little ones.

I have written elsewhere of my first meeting with Waptonk, the big gander, in the interior of Newfoundland, of his apparent lack of fear—so different from what I expected—of his brave defense of his mate, and then of his marvelous care and sagacity in watching over the young goslings. To understand him better, I

Flock of Wild Geese. From a Drawing Made Especially for this Article by E. W. Deming.

began at the beginning—that is, with the young birds as soon as possible after they had chipped the shell.

Here again my first impression was one of singular tameness and fearlessness on the part of the young geese, which, a few months later when they should cross the domains of men, your hunters would find wild and wary beyond measure. That this latter wariness is due directly to the old birds, which have learned the danger and which guide the young on their first southern migration, is beyond a question. Here on the lonely barrens, where the foot of man seldom rests, they swim about the sedgy flashlets, or wander wide for grass and berries, or practice their funny little cackling choruses, with marvelous freedom and carelessness, as if there were not such a thing as an enemy in the world. On my approach they would look at me with bright, curious eyes; then, at a low signal from the mother bird, they would go quickly ashore and hide; while Waptonk would circle about on patrol, or station himself squarely across my path if I approached too near. And when—upon rare occasions, for I admired them too much to trouble them—I disregarded the old birds and brushed them aside and went to the little ones, they suffered me to pick them up without resistance, seeming to like their petting, and would share readily the lunch of black bread which I offered them.

Many years ago I came to the conclusion, from watching young cubs and fawns, that there is very little, if any, fear born in a wild animal. Instead of being instinctive, fear seems to be largely the result of immediate pre-natal influences and of the mother's example and influence as she hovers about her little ones. She knows the danger, and they do not; and it is largely from her alarms that they learn what fear is. Watching these young geese, so friendly and unsuspicious on their own lonely heath, so wild and marvelously intelligent in avoiding all human devices on their southern migrations, one could hardly escape the opinion that fear is not among the things that are hatched out of an egg—an opinion which, I understand, Professor Hodge is also slowly forming as a result of his experience in raising ruffed

grouse for the first time in captivity. My friend, Dr. Robert T. Morris, who has camped and fished much in Labrador, writes me that his own experience corresponds to my own in regard to Waptonk's natural fearlessness and even friendliness to man. He writes:

"Often I have canoed all day where I would have wild geese almost constantly under observation. I have often taken the goslings into my canoe for company in the morning, and at night have taken them back to the mother flock. They grow tame immediately, and take food from one's hand at the end of a few hours. I used to kill them to eat, for they are delicious; but after I found that they trusted me and would eat from my hand, I could not kill another one, nor allow my Indians to do it."

In the little fishing village of Howe Harbor, on the east coast, I used to watch a flock of six wild goslings that had just been caught in a neighboring pond. The day after they arrived they were running free about the yard, disregarding men and the wolfish huskie dogs alike, and would feed eagerly from the children's hands. Whatever fear of man they possess, therefore, seems to develop late, and seems to be the direct result of the parents' teaching or influence during the migration, rather than of any inherited instinct.

As for their fear of other animals, I was unable from my own observation to form any opinion. In the lonely country where I first discovered Waptonk there were some wolves and bears; while lynxes were numerous, and foxes of three or four varieties were more plentiful than I have ever known them to be elsewhere. But Mooween the bear would never trust himself on the soft, dangerous footing about the ponds where Waptonk is at home; the lynx hates the water that lies just beneath the moss everywhere, and finds plenty of hares and rabbits in his own haunts under the hills. Even the fox would be at a disadvantage in the moist, clinging *sphagnum* into which your foot sinks almost to the knee as you walk; and aside from this disadvantage, I doubt if any fox could make any headway against an enraged wild gander. Unlike the ducks, the male geese watch constantly over their mates and little ones; and it would be a lucky fox and a valiant one that, except by rare accident, would ever have a chance

to steal a gosling and run away with him over the unstable footing. The Arctic wolves—immense fellows that turn white in winter—are back on the hills in the timber, where they feed chiefly on small game and occasionally on the numerous caribou. So it would seem that, even among savage animals, the life of the young wild goose is singularly free from the fear which we have attributed to the birds while watching their winter life, when the hand of every man and boy is against them.

The conduct of the goslings when disturbed tells the same wholesome story. On the first warning from the old birds they go quietly ashore and hide, trusting to the wet moss and the bottomless mud about their hiding place to shield them from any large enemy, and confident in their parents' courage and strength to save them from lesser prowlers. Even after they can fly well the young birds seldom take to water, except it be the open ocean or a great lake, but will light in the nearest grass or underbrush and hide instantly. Watching the young birds' flight you may go straight to the spot where they alight and there find them, if your eyes are keen enough, for they are hard to find even when under your very feet. They hide with all the cunning of a black duck, and generally the only way to detect them is by their eyes, shining steadily, like jewels, among the roots and grasses. And when you uncover them at last they lose all fear, like little fawns, in a bright curiosity to know all about the strange animal that has come gently to pet and feed them.

The rarest experience of all was to crawl near and watch the flock when they were entirely unconscious of your presence. In the morning you would see them start out across the barrens to feed, and would notice the beginning of that wedge formation with which they make all their long migrations. The mother would walk at the head; and strung out and back on either side of her, like a broad arrow head, would come the young birds, walking straight ahead in parallel courses, and with a space of a couple of feet on either side of each gosling as his own foraging grounds. So they would cover a broad strip of the barrens, moving forward in a straight line

and finding every tender bit of grass and every cluster of berries in their course. But whenever the mother or one of the goslings came upon tender grass, or berries in abundance, or a bed of the delicious bake apples, the whole wedge would waver and break, and all you would see would be a hopping, hurrying mass of fuzzy bodies, cheeping, whistling, scurrying about lest they should miss the best morsels, and *honk-honking* their satisfaction as they gobbled down the rich abundance. Then the wedge would slowly form again, and they would start off in eager search of another find.

It was very noticeable that, in leaving the little pond and crossing ground that had already been gleaned, or wherever there was any alarm, or treacherous ground to be crossed, the goslings made no attempt at wedge formation, but clustered together and followed carefully the steps of the mother bird, or else stood perfectly still until she called them on. The wedge seemed to be used to cover thoroly a new piece of ground, where each might have his own territory, and where every young bird could have plain sight of the leader as they moved onward. Possibly, also, there was a definite training here for the wedge flight to which all geese must sooner or later be accustomed.

Wherever the geese went, whether questing for berries, or preening their feathers, or gathering with a multitude of their fellows on the open ocean, they were forever gabbling. Only the immediate presence of danger kept them for a moment silent; and I found myself often wondering whether the astonishing gamut of sounds has any fixed and definite meaning. Aside from this question of communication, the voice of a goose, ranging from the sleepy twilight whistlings and cheepings to the deep brazen roar, like the clang of a Chinese war gong, with which he voices his defiance on land or shouts aloud to the spring from the high heavens, is perhaps the most marvelous in all nature. Tho the voice have no musical quality, yet for a certain barbaric, martial clangor it has no equal; and if Rome were indeed saved by its geese, I can fancy that every Roman soldier, when he heard the wild midnight alarm, jumped for his weapons

as if a bugle had called him. Here on the lonely barren I could at times hardly locate the gentle sounds, tho half a dozen geese were gabbling within twenty yards of my hiding; while in the spring the same flock, passing overhead at an enormous altitude, would rouse every lagging goose and stir the heart of every man within five miles of the thrilling jubilate.

How nature can put so much power into so small a compass is one of the mysteries. Nothing in man's inventions (unless it be a huge affair of a steam fog-horn) and perhaps nothing else in the throat of an animal can begin to equal the carrying and penetrating power of the wild goose *honk*. I have often tried to estimate the distance at which it can be plainly heard; but all such estimates are largely guesswork. Once, when I heard a flock of geese on the open ocean, their distance, as estimated by a shoal and buoy, was a full three miles. Another time I had a chance to compare them with a bull moose, whose voice is a grunting roar that startles the woods like a gunshot. I was calling from a lake, one night, when a bull moose answered very faintly from the mountain side behind me. It was a perfectly still night, with moist air in which sounds carry perfectly, and as I called I could trace the huge brute's course as he came down the mountain, the roars growing heavier and heavier till with a terrific crash he broke out on the open shore. From three to four miles was the estimated distance at which I first heard him; tho he had probably come from farther away, his keen ears having heard the rolling bellow of my birch bark trumpet. A few days later a flock of wild geese passed over the same lake, flying very high, on their southern migration; and I heard plainly the leader's deep *honk* and the flock's cackling answer after they had passed over and beyond the same mountain, at a distance much greater than that from which I had first heard the big bull's answer.

When the young birds were well grown they deserted the little flashlets and the lonely marshes where they were born, and the parents led them to the shallow bays and inlets of the ocean, where the scattered families gradually united into immense flocks. The family

ties were still strong and would remain unbroken thru the winter, each pair of old geese leading and guiding its own family group in all their flights and feeding. In the morning the great flock would scatter widely, the families going away separately, some to explore the shallows and inlets of Pistolet Bay, others flying overland to the ponds and barrens where they were bred; but in the afternoon the scattered flocks would return and reunite, playing and honking together, in obedience to their social instinct—which is very strong among the geese, as among the caribou of the same great barrens.

It must be remembered that, of these great flocks, at least four-fifths of the birds were younglings, which had never been away from the little ponds where they were born, and which knew nothing whatever of the world or of the great southern flight that awaited them; while the other fifth were wise old birds that had made the journey, some once, some thirty or forty times. These old birds, therefore, might reasonably be expected to have some thought for the change that must speedily take place in the life of the goslings, over which they had watched so carefully; and it was but another small step to see in their methods of play and flight a direct preparation for what was to follow. The casual observer, stumbling upon one of these great flocks and seeing them straggle off in alarm, and then never seeing them again nor thinking about them, might comfortably and thoughtlessly attribute everything in their movement to blind chance and instinct; but one who had watched over them for weeks, and who remembered the marvelous intelligence and teachableness for which the wild goose is noted, was forced to see in all their movements the glimmerings, at least, of an intelligent purpose, the extent of which was probably even greater than he dared to surmise.

First, in the matter of their play, I would lie for hours behind a screen of evergreen, watching a great flock thru my glasses and noting every movement. At first the families would hold apart, like young caribou which are brought for the first time out of the woodsy solitude, where they are born, to the open barrens

where hundreds of their kind are congregating. Gradually they would mingle, raising their wings in the sea fowls' salutation, honking and playing together, till a score of families had drawn together in a close flock. If at the outer edges a sharp *ha-unk!* of alarm was raised, only the nearest geese, and sometimes apparently only the family of the watchman, would pay attention to it. If the alarm were genuine the flock scattered raggedly, the families rising at different times, and each pair of parent birds leading away its own goslings. Gradually all that was changed; the first alarm note was heeded by every goose, no matter who uttered it; the flight became regular, till at the end of the season the flock would rise almost as one bird and follow the same leader down to the bay, instead of scattering in twenty different directions.

In the flight itself were a score of things to fill one with surprise and wonder; for flying seems to be an art and a delight to the wild goose, as it is to the eagle, and the young birds learn it slowly. First there was the wonderful spiral descent from the heights—one of the rarest and most impressive sights in animate nature—which I have described elsewhere. A great wedge of birds would come winging high over the lake, talking volubly to each other, as geese are forever doing in their journeyings over strange territory. Suddenly above the clamor would sound a peremptory *honk*. All the talking would cease instantly, the wedge would break into two parts, the sides swing together in a single long line, and down they would come, one after another, as if gliding down an invisible winding staircase, in perfect order and in perfect silence.

I have learned since, in watching geese in many places, that this flight is never used when the birds go out to feed or when they swing to the decoys, but only when they return well fed and contented to their night's lodging place. In the far North, where I saw it but a few rare times, it seems to be a kind of practice drill, with the object of enabling the young birds to come down safely from a vast height to a little wooded pond, where a direct descent in a long slanting line would be almost impossible on account

of the trees in the way. Like the wild geese, Hukween the loon almost invariably comes down to a little pond in a spiral, and uses the long, gentle incline only when the waters are wide enough to enable him to come down in this way without hitting the trees on the shore. Since the Canada geese are mostly raised in the open barren lands, where there are only a few stunted trees near the nesting places and where such a flight is entirely unnecessary, it is at least possible that the old birds train the young to this flight to prepare them for the halting places on their southern migration.

Scarcely less impressive than the wonderful spiral of the Canada goose, when he winds slowly down the invisible staircase of the winds, is another descent—a slow, majestic settling downward in perfect column, like the fall of a feather in its airy lightness. At sight of the pond in which they are to rest the leader *honks* sharply and the whole flock swings into line behind him. Then with every wing set at the same angle the column slants downward, slowly, gently, silently, bending to their rest with indescribable grace. When the drooping feet touch the water at last the stiffened muscles relax, and the broad wings sweep them gently over the surface for an instant, till all momentum is stilled; and then, with a touch like a kiss, the broad gray breasts settle into the blue waters. An instant later they have swung into a close group, watching intently to see that the flight is ended and the waters safe, then they turn away, honking gladly to their bathing and preening.

Much more stirring is the descent of another and smaller goose, in which wild hilarity seems to break loose all at once in the solemn flock. On approaching a pond the leader, instead of lowering his flight, will often call them up to an enormous height, where they circle silently for a moment over the water, as if measuring the plunge. Again the sharp signal of the leader, and pandemonium breaks suddenly loose, just as a lot of orderly boys break and tumble over the school-house steps at recess time. Down they come, no orderly, majestic descent this time, but a madcap rout that makes you catch breath in astonishment. Whirling, diving, plunging, down they come, som-

assaulting with ten times the velocity and abandon of a flock of tumbler pigeons, and honking to break their throats. The glorious rush and tumble of it all makes you want to jump up and fling away your hat and just yell. Near the water the great wings suddenly spread and set; the clamor ceases; the wild birds circle into orderly line, and then throwing up wings and breasts against the air they stop flight in an instant and drop quietly and silently into the water.

One thing forced itself gradually upon my attention as I watched these interesting birds in their own domain, and that is that the flight of the young geese is directed continually, and perhaps consciously, by the old birds to future needs of which the young know absolutely nothing. From the moment they begin to use their wings, first in short, scrambling flights, then to new ponds and feeding grounds which the old gander has discovered for them, then to the ocean and back again, and then the rising against the wind, and the spiral descent, and the disciplined wedge flight with his fellows—in all these things the gosling was being prepared by Waptonk and his mate for the great migration that was speedily to follow.

The next question, a great and open one, was the question of instinct and migration. That Waptonk should migrate southward in the fall is simple enough, being a case of necessity; but why he should leave a land of plenty and quiet in the South, in the days when there were no men to bother him, and seek the cold, bare hospitality of the North to rear his young, is still the unanswered question. At present it is simply a case of habit, repeated and strengthened year after year; but how the habit first began and gained such increasing hold upon them is one of the mysteries. And the scientists seem just as far from an answer, and differ quite as widely among themselves as the plain bird lovers.

Whether the goslings, left entirely to themselves, would ever migrate, is extremely doubtful. Here and there, in the scattered fishing villages on the wild coasts, I would find a flock of the birds

that had been hatched under a domestic fowl from the wild eggs, or that had been caught young and brought alive to the village. So far as I could discover, from my own observation and from questioning their owners, these pure wild birds showed no instinct whatever to migrate at any season.

Occasionally, indeed, they would roam away and try to make their way back over the hills and barrens to the flashlets where they were born. If a passing flock called to them overhead, whether the flock were going south or north, or simply out to the shoals to feed, the young birds, like domestic geese, would call back and stretch their wings to follow. But aside from this purely social excitement I saw no evidence, and found none, tho I hunted diligently for it, to show that the young goose had any inborn tendency to drive them either south or north.

The social impulse, therefore, the tendency under excitement which draws a creature to his own kind, may altogether account for Waptonk's migration, and perhaps for that of all other young birds. A thrush in a cage grows uneasy and excited at the call of a number of his free fellows at any season. An old horse shut up in a stable yard kicks up his dull heels and gallops stiffly along the wall when a troop of cavalry horses pass along the road before him. A man standing at the window feels stirring within him the impulse, which his child obeys hilariously, to go down and join a moving procession. Beast calls to beast, and bird to bird, and man to man, the free to the slave, to come out and be free with his fellows. So the question arises whether the simple social instinct be not enough to account for the whole phenomenon of migration. That, of course, does not consider the origin of the habit, which may be sought for in geological changes on the earth's surface; but it simplifies enormously our thought of the flocks that call to us from the high heavens every fall and spring time. The old birds are obeying a lifelong habit, copied, as most habits are, from their elders; the young birds are simply going where the others go, and following their leaders as they were trained to do.

# MY BUFFALO EXPERIMENTS

BY C. J. JONES (BUFFALO JONES)

FORMERLY GAME WARDEN OF THE YELLOWSTONE NATIONAL PARK

A Herd of Catalo. They Have Lived for Thirty Days on This Sterile Prairie Rooting Through the Snow a Foot Deep for All They Had to Eat.

LESS than a score and a half years ago there roamed over the American continent millions of big game—a great source of meat supply, now sadly missed. The area comprised a vast empire of itself, bordered on the east by the Mississippi River, on the west by the Pacific Ocean, on the south by the Gulf of Mexico, and on the north by the Arctic Ocean.

The greatest and most numerous of these animals were the bison, or what are commonly called buffalo. These, as nearly as can be computed, numbered fully fifteen million. The antelope came next in number, about ten million. The different species of deer were next, seven million; the wapiti, or elk, numbered about five million; mountain sheep, about one million; while on the barren lands of Canada, which are beyond the limit of the white man's hunting ground, the caribou, or reindeer, roamed in millions, probably ten million; while the moose might be reckoned at two million, and mountain goats at one-half million, bringing the total to nearly fifty million.

These animals properly belonged to the Indians, who at that time probably did not number more than two hundred and fifty thousand. By an equal di-

vision among them each would have had about two hundred animals. If the wealth of these Indians had been computed by flocks and herds they would have been the richest people on the face of the earth, but if computed by the same rule today they would be the poorest of God's creation.

Roughly calculating, the bison have been reduced in number until there are only about fifteen hundred left; the antelope to about eight thousand; the deer to about twenty thousand; the elk to forty thousand; the moose to ten thousand; sheep to five thousand, and goats to four thousand, or an aggregate of about eighty-five thousand.

Of this number, nearly one-half are in the Yellowstone National Park, and belong to the people of the United States. Leaving about forty-two thousand to the mercy of over one hundred million people, as Canada must be reckoned in, and with the terrible destructive firearms now in use, how long will it be before there are no animals left, except those in the Yellowstone and in private parks?

The only salvation for the perpetuation of all our game is national parks and private preserves, for these are the only places where game is immune from the

palace's deadly weapon. To be sure, these figures are only approximate, and may be too low or too high, but they serve to illustrate an approaching national calamity.

Having been active among the wild animals of North America all my life, and especially in the domain alluded to, I feel competent to submit the above figures.

The most desolate, barren and sterile part of the big game region of the United States is the Yellowstone, especially in the winter, which lasts about eight months of the year. Snow lies over nineteen-twentieths of this area, on an average of from three to six feet deep, and the thermometer registers often sixty below zero. The most surprising thing is that the animals who live there survive at all. It proves beyond a doubt that nature has made them perfect to their environments. If these animals in the park had but the protection from man they rightfully should their number would be doubled every three years. They would soon invade the adjacent country and furnish meat supplies for the inhabitants. If the mountain lion and coyote were exterminated the result-

ing increase would soon be perceptible. The lion should be killed, if for no other reason than to protect the last herd of wild buffalo in the United States, which have fled to the almost impenetrable fastnesses of the mountains in the park. Here the young calves are born each year, only to fall prey to their enemy, the lion, who feasts upon their delicate carcasses.

While game warden of the park I succeeded in saving three of the calves of the wild herd. Today they are the gentlest of the domesticated herd in the park. They are two bulls and one heifer. The capturing of these animals was a most fortunate thing, as it brings into the herd a strain of blood of no akin to any in captivity. In order to save these animals almost superhuman efforts were used, as these calves were born fully sixty miles from the headquarters of the park employees, and at the time of year when there was from three to five feet of snow most of the way. It was impossible to reach their haunts except on skis, or snowshoes, and the snow was so soft and slushy it adhered to everything it touched.

On April 6th, 1903, with two scouts, I

Domesticated Herd of Buffalo in the Yellowstone Park.

started for the haunts of the buffalo. The first day we made only eleven miles, and camped that night in an old, abandoned cabin, without bedding, and as the thermometer was probably about ten above zero we suffered from the cold. There were a few crackers and a little corned beef stored away in a box, so we considered ourselves fortunate indeed. The next day we made nine miles, and put up at the Norris Station, where soldiers stay during the winter. The third day we came to the Grand Canyon thru a blinding snow storm, where we found the soldier boys delighted to see us. The fourth day took us to the Yellowstone Lake Station, a distance of sixteen miles, and on the fifth day we reached the habitat of the buffalo, thirteen miles away, on the Pelican River.

The snow was about three feet deep on an average and the thermometer registered about twelve above zero when we left the soldiers' quarters. The worst feature about the journey that day was to cross the Pelican River. The warm days prior to our arrival had caused the ice to break, and the river was fifty feet wide on an average. There were several wide places where it was swift, but only about two feet deep, so we concluded to divest ourselves of our shoes and stockings, roll our trousers up, as little boys do, and plunge into the icy cold water, where the floating slush ice came thick and fast. It must be remembered that to remove our shoes it was necessary to sit on a bank of snow, three feet deep, and when we clambered up the opposite bank there was no less snow, nor was it any warmer than that on the other side, as we were traveling northward.

Carrying our skees, shoes and other paraphernalia we managed to wade thru, and that night we reached a hut which had been built for just such emergencies as this. A few quilts and plenty of straw had been provided, also crackers, canned pork and beans, so we felt quite elated to be able to take a good rest. The next morning, by using our field glasses, we discovered a herd of buffalo, fifteen cows and two bulls, about three miles to the eastward. By making a long circuit we came within a quarter of a mile of them, and endeavored to see if there were any calves with them. They were

so on the alert, however, that our presence was discovered and they dashed away at full speed, going directly toward our cabin. They finally halted in a deep valley, not to exceed one-half mile from the cabin, and we saw that there were three calves with them.

The day was warm, and traveling on the skees was exceedingly arduous, so we slipped around them and reached our quarters without again disturbing them. The next morning we were up and out at four o'clock, and made arrangements to make a raid on the calves, knowing, as we did, that, as the night was cold, the skees would glide easily and noiselessly over the hard snow.

At daylight we looked into the valley, but the herd had fled. Their tracks indicated that they had gone toward the neighborhood where we had first located them. I stationed one scout half way up the mountain just above their trail, and instructed him, if the herd came up again, to descend with all speed and place himself between the herd and the calves, which would be sure to be behind. I knew that the calves could not break a trail for themselves, and, by standing in the trail of the old ones, he would cut the little fellows from the herd.

I had not expected that the little rascals would attempt to "butt" the scout out of the trail, which was about three feet deep and two feet wide, or I would have told him not to attempt to lay hands on them, but just to keep them back until the old ones were out of hearing distance, or their bleating would bring an avalanche of horns upon him.

I went a mile northward, and stationed myself so as not to allow them to go up the river, as I knew they would do to avoid the deep snow. I felt sure that by firing a revolver it would turn them down the river and send them near Scout Holt. The other scout, Morrison, was sent on their tracks to start them going. It was perhaps an hour after we had parted that I heard a revolver report in the direction taken by Scout Morrison, and presently down came the herd, with four calves tagging along behind. When they saw me they shied off, and took the trail down the river, as desired, and as they passed the base of the steep mountain Scout Holt went down upon the herd like a bald eagle after a rabbit. He

was an expert on skees, and soon landed in front of the calves. But the little brutes plunged right at him, and, unfortunately, he grabbed them both; as expected, they bawled right lustily, and back came their mothers in a great fury.

There was only one thing to do, and that was to get out of the trail with all expediency, which Holt immediately did, and as soon as the old ones saw that their little ones were free they wheeled and followed the herd, with the calves at their heels. But Holt was game, and the gait he took up over the hills and down

an innovation, but being intelligent and obedient creatures they soon trotted off like well broken horses. We were off the next morning at the break of day, so as to take advantage of the crusted snow. As the night had been severely cold crossing the river again was terrible work, as it required several trips across, for we had to carry the calves and the sled in our arms.

By eleven o'clock, the day after the calves were captured, we had them at the Lake Station, where there were some domestic calves and their mothers. Here

A Team of Buffalo Calves Broken to Harness by Ernest Harold Baynes at the Corbin Reservation, Meriden, N. H.

the valleys was one not known to even the Norwegians themselves, who are the most expert snowshoers in the world. He soon headed off a calf which had dropped so far behind that its bleating could not be heard, and quickly had it tied and was off after another one, which he overtook after a long chase. The next consideration was how to get them to some place where they could be cared for.

It was impossible to carry them, so I ripped up some "gunny" sacks and made a harness for the three lion hounds which I had allowed to follow me on the trip. The dogs had never been in harness before, and were much surprised at such

the little fellows were given their first lesson in domestication. One of them was very greedy and gorged himself until he came near dying, but they both pulled thru and are now fine specimens.

During the trip I became totally blind from the snow, and for six days was obliged to employ one of the soldiers to care for me, as I was unable even to feed myself.

We read of the shepherd who was not content with the ninety and nine, but went on the mountains thru rain and snow to find the sheep which was lost, but I dare say he did not travel so far nor cross mountains so "cold and bare" as did our little party to rescue the last

calves, and thus rekindle the last spark of a dying race.

I wonder how many people have ever considered the bison and all their peculiarities. Nature has brought them along thru untold ages and fitted them to their environments.

No howling blizzard or scorching sirocco can molest them; the pelting storms cover up their provender, yet they root like swine thru the snow and ice, and are happy with the food they find. If they fail to secure food, for even weeks at a time, they are not alarmed, as they draw sustenance from their great humps, nature's own provision for times of famine, given alike to the camel, Persian sheep and bison, proving that she meant them to populate the desert and waste places.

The buffalo never destroys a blade of grass unnecessarily, as he travels in single file, stepping in the exact footprints of his compeers. If he is a benefactor, who causes two blades of grass to grow where one has previously grown, how much more is a buffalo a benefactor when he preserves thousands of blades by his wonderful intelligence?

Being cognizant of these facts, and having lost two-thirds of my domestic calves by a severe blizzard during the winter of 1885-6, I determined to engraft this blood of a hardy race upon our domestic cattle, and secure, if possible, all the hardiness and good sense of the buffalo and the mild disposition of our native cattle. This I ardently endeavored to do, following the experiment thru discouragement and failure, encouragement and success, for twenty years; and now I have far exceeded my most sanguine hopes. The new animal I called the cat-

alo; cat for the first letters of cattle and alo the last letters of buffalo. To be sure, it cost me a fortune to accomplish this, as it has all others who have tried it. Like them, I met with many reverses; but the more obstacles, the harder I fought, until, partly by persistent effort and partly by accident, I passed beyond the possibility of failure. Our catalo company now have sixty head of magnificent animals; many of the cows weigh over a ton, and their meat is far more desirable than the choicest beef, while their robes are so much more valuable than the robes of the buffalo, that they cannot be mentioned in the same breath. I have refused as much as \$1,200 for one robe. All this, no doubt, sounds incredible, but it is, nevertheless, a fact. The catalo utilize the most sterile regions of the West and Northwest, and do not need either artificial food or shelter. They are surely destined to be of great value, for there are yet over six hundred million acres of unclaimed Government land, so sterile that domesticated animals cannot utilize it, but sufficiently fertile to provide a living for the catalo.

To my mind, Alaska would be an ideal home for this wonderful hybrid. However, I would not encourage any one without an intimate knowledge, to attempt the propagation of this new breed of cattle, for failure is pretty sure to result.

I am still testing my knowledge and methods, and in due time they will be given to the people thru the Agricultural Department at Washington, who have provided me with a suitable range in Arizona, where I am now testing all grades of catalo, and am experimenting in the hybridization of other animals.

YELLOWSTONE NATIONAL PARK.

Meat from a catalo cow which never tasted of food provided by the hand of man. During the winter this cow rooted over a month thru the snow a foot deep for every spear of grass she obtained.

## LOOKING BACKWARD

AN UNPUBLISHED POEM BY JOHN GREENLEAF WHITTIER

[During Whittier's residence in Philadelphia, 1838-1840, a young lady friend, of that city, herself the writer of pleasing verse, Miss Elizabeth Nicholson, began a manuscript collection of his poems, including literally everything he had published at that time. This collection also included many sportive and satirical verses, never published, but circulated among his friends. She was helped in securing his earliest work, his boyish poems, by Mr. Whittier's sister Elizabeth, who spent some months in Philadelphia, while he was editing the *Pennsylvania Freeman*. While the collection was making Whittier was not aware of it, and gave no help. He was naturally annoyed when a handsomely bound volume of neat manuscript was handed him with a request that he would write a preface for it. He had hoped that the "vain dreams and follies of his early times" had been consigned to oblivion, and did not relish the raising of their ghosts while he was engaged in serious work. But as it was in manuscript only, and for the perusal of intimate friends, he consented to furnish the desired preface, with the result given below. The lines have a value as showing the attitude of the poet in middle life toward the less unselfish ambitions of his youth. The unique volume referred to, with its introduction in Whittier's handwriting, is now in the possession of Miss Nicholson's relatives.

S. T. Pickard.]

INS of my luckless boyhood! Ghosts of rhymes!  
 Vain dreams and follies of my early times!  
 Fruits of brief respite from the student's lore,  
 Or conned at intervals of labor o'er  
 When stretched at ease where oaken shadows lay,  
 And the stream winded at my feet away;  
 The unconscious ox that panted at my side,  
 The dog that fondly his young master eyed,  
 And, on the boughs above, the forest bird  
 Alone rude snatches of their measure heard,—  
 Or uttered when the world's enchantment first  
 On dazzled eye or kindling spirit burst;  
 When flattery's voice in woman's gentlest tone  
 Woke thoughts and feelings heretofore unknown;  
 When halls where wealth and beauty, wit and mirth,  
 And taste refined, and eloquence and worth  
 Felt and diffused the intellect's high joy,  
 Opened to welcome even a rustic boy;  
 Or where ambition's lip of flame and fear  
 Burned like the Tempter's at my listening ear,  
 And a proud spirit, hidden deep and long,  
 Rose up for strife, stern, resolute and strong,  
 Conscious of power, and proudly looking up  
 To the high places of the land with hope.

The idle dreams of the enthusiast boy,  
 Imagination's sorrow and its joy—  
 Woes upon paper, misery in reams,  
 Distress in albums, and despair in dreams—  
 The dim world of the ideal—all the vain

And shadowy tribulation of the brain—  
 The Berkleyism of Poetry, which sees  
 The real a dream, and dreams realities—  
 Thoughts born of feelings now disowned and spurned,  
 Breathings of hopes for which my spirit yearned—  
 I look upon ye with no kindly gaze—  
 Ye frail mementos of my boyish days!  
 I love not now, with manhood's soberer eye  
 To read the lesson of your vanity.  
 Record of time misspent, of mind abused,  
 Of God-given powers in folly's service used!

Oh for the power to dedicate anew  
 Heart, soul and spirit to the right and true—  
 To offer up on Duty's holy shrine  
 The morning incense of a heart like mine!  
 But vain the wish! Let the time past suffice  
 For idle thoughts and worse than vanities.  
 Thy will, Oh Father! hath it not been shown?  
 Thy gentle teachings have they not been known?  
 Have I not heard amid life's stormy din  
 The voice of bland entreaty entering in,  
 When midst my selfish aims of power and fame,  
 The mournful sighing of the captive came,  
 And a proud heart thru all its triple steel  
 Melted at others' woe, and learned to feel?  
 Oh for Thine aid to bend anew the knee,  
 And turn my spirit wholly unto Thee;  
 To give up all—nay cease to claim as mine  
 In pride of heart, powers which alone are Thine;  
 To Thee the abused and wasted gifts restore,  
 Nor dare abuse Thy holy bounty more!

And thou whose partial hand hath kindly penned  
 These frail and wayside offerings of a friend—  
 Who, cold and calm in outward seeming, yet  
 Hath never learned a kindness to forget—  
 Thou unto whom is given that gift of mind  
 Which, pure itself, delighteth still to find  
 Beauty in all things, anxious to make known  
 Another's gifts, while careless of thine own—  
 Forgive me, if in gazing coolly now,  
 With manhood's cautious eye and thought-worn brow,  
 Even with a grateful sense of secret gladness,  
 There blends the shadow of regretful sadness.

Philadelphia Nov. 5th, 1840

# Popular Aeronautic Sports

BY GEORGE ETHELBERT WALSH

"LET me go up in the balloon. I'm eighty-two, and I want to make an ascension before I die, for I know it will be a common sport when my grandchildren grow up."

Thus begged an old farmer of Charles Levee after his first successful ascension at West Point in the French balloon, "L'Allouette," under the auspices of the Aero Club of America.

"Can a woman go up in the balloon

Shoals of letters and telegrams have ever since been pouring in, some asking foolish questions, others proposing suggestions, and a few pertinently offering money for the furtherance of the present movement to make aeronautic sports popular. One millionaire discoursed thus to his son after reading the account of the ascension:

"There, my son, is the opportunity for you. Drop your automobile and au-

Levee's First Ascent at West Point.

and come down safely?" wrote an enterprising woman, adding with commendable caution: "If so, I should like to make the next ascension with you."

"How much can you make a navigable balloon for? Telegraph at my expense." This query and command came in hot haste, after the ascension, to the Aero Club from a millionaire sport. Another equally to the point said: "Name your price for 'L'Allouette.' Also for the aeronaut."

to-boats, and go in for airships and balloons. It's the coming sport. Anticipate it, and get in on the ground floor. It's the new things that always pay. The old things are already monopolized. Put your money in the manufacture of airships, balloons and flying machines. Within a year or two you will find the wealthy eager to buy them. It's a new sensation that stirs the sluggish blood of your blasé millionaire, this navigating the air. If I was a young

man I'd go heart and soul into this business."

A long-haired inventor, armed with patents, patents applied for, and patents refused, walked into the charmed circle of the Aero Club, and securing the attentive ear of one of its members, opened

They cover the technical points of Professor Bell's tetrahedral kite and include the mechanical perfections of Kimball's helioptere. A machine built according to these designs and protected by these patents would have all the buoyancy of Ludlow's combined box kite and

Prominent Members of the Aero Club. Right to Left: Third from End, Count De la Vaux, Cortlandt Fields Bishop, Hawley, Augustus Post, Levee and A. M. Herring.

up a stream of talk that could not be easily checked.

"Here, sir, are the patents which cover everything worth having in airships," he said. "I have worked out the inventions in my laboratory until they are perfect. They combine all the merits of Langley's motor-driven aeroplane with the best points of Lilienthal's aerodrome.

aeroplane and be as easily controlled as Myer's electrical torpedo. Santos-Dumont's airships are antiquated inventions compared to the model I have under my arm. The apparatus is so perfect that it can float and soar like a bird, dive like a fish, and fly as the frigate-bird flies. It can glide with the zephyr and breast a tornado with equal ease. Rain and

storm, thunder and lightning, sunshine and gentle breezes would be equally futile in swaying it from its course. In this machine is wrapped up the fortunes of many, and the hopes of the millions."

All of which were offered for a few paltry thousands and an interest in the company organized to manufacture the airships. The man appeared disappointed when his propositions were turned down.

A score of letters addressed to successful aeroneautists ask for detailed accounts of their sensations. "Would it affect one with a weak heart?" queries one. "Do you get dizzy when you ascend? Can you tell me whether the blood rushes to the heart or brain when

you reach an altitude of a thousand feet? How high can a man ascend without suffering any unpleasantness in breathing?"

There is little doubt in the minds of those best equipped for answering the question that aeronautic sports have entered upon a period of great popularity in this country. Said Cortlandt F. Bishop, president of the Aero Club of America, in an interview given to a representative of THE INDEPENDENT:

"We are going ballooning this year, as they do in France, and Count Henri de la Vaulx, a very famous and successful French aeronaut, has come to this country to be our leader. We have established a station at Pittsfield, Mass., where balloons may be filled, and from that place throughout the summer there will

Dr. Thomas and Mrs. Thomas Standing Beside the Balloon Prior to Its Inflation at Pittsfield, Mass.

Last Balloon Ascent at Pittsfield, Mass., April, 1906.

be regular ascensions on Saturdays. Parties of four or five ladies or gentlemen of the club will arrange to be taken up, and they can be followed by their automobiles so that when the balloon comes down to earth after the ascension the passengers can go their way in comfort.

"Ballooning is now safe and comfortable. There are not so many accidents among its professors as among a similar number of automobilists. And it is a most delightful sport! There is no reason why it should not be as common here as it is in France. Even if the balloon bursts and the gas escapes, the huge bag acts as a parachute and lets the passengers down usually without any great shock.

"Ballooning is certain to be very popular here when its safety is better recognized. No other means of motion is comparable with it. The ascension is so easy and the party in the car slip along so gently. There is no rocking, no jarring. The balloonist is far from all the noises of the world, softly wafted down the air currents, and all in the sunlight like the fleecy clouds. Down below the pleasant country spreads with its rivers and hills and woods and fields, its roads and villages and big cities with their clouds of black smoke—

a thousand details moving in front and behind.

"Up in your balloon you may picnic if you please. You may move about in the car without fear of a fall, and while you are there at ease you may go as high as your ambition desires, and change your direction by changing your air current at different altitudes. If you keep your eyes inboard you have no sense of motion, yet by looking down you can see the world slipping away at a very fair speed, perhaps twenty miles an hour, perhaps even faster.

"The mission of the Aero Club just now is to popularize ballooning for the pleasure it gives. Later we may transfer our allegiance to the true airship when the right airship comes along—that is, the airship that can carry passengers without treating them too disrespectfully.

"A balloon trip, such as I have sketched, would probably cost \$40 to \$50 for a party of four or five, so it is not beyond the reach of those who travel in automobiles, while it has the great advantage that there are no farm wagons to dispute the way, no children to be run over, no barking dogs filling the air with hideous discord, and no country constables

and judges seeking monetary mollification for broken speed ordinances.

"As to the airship which is to fly like a bird and carry passengers more swiftly than the express trains and as safely as the ocean steamers, there are several directions in which we are now looking with hope. The brothers Orville and Wilbur Wright, A. M. Herring and Peter Cooper Hewitt are all struggling with the problem of attaining aerial flight independent of a gas bag. The Wrights have made some very marked successes. In a recent report made by them to us, and supported by reputable witnesses, they show a steady advance in the efficiency of the man-carrying motor-flyer with which they are experimenting. In the flight of October 5th, 1905, the airship, under perfect control, flew 24 1-5 miles in 38 minutes and 3 seconds, stopping only because of exhaustion of fuel. In 160 flights, during which they alternated, neither of these brothers received any serious injury. Every flight they made in 1905 was better than that which preceded, and if they make similar progress this year it will look as if they have solved the problem.

"A. M. Herring and Peter Cooper Hewitt, of New York, also have airship secrets which they are guarding so carefully that we only know that they are working hopefully on the problem of true flight as distinguished from ballooning."

Physicians, too, are interested in the development of the new aerial sport. What effect will the air at different altitudes have upon patients suffering from various diseases? Would it be possible to save the life of one suffering from pulmonary troubles to send him up in a balloon for a few hours each day where the air is dryer and more rarefied? Is it safe for any lover of the sport to make an ascension before a medical examination has been made of heart, lungs and

other vital organs? What relative proportion of our population can stand the rarefied atmosphere at one or two thousand feet altitude without inducing symptoms of vertigo, heart failure, lung stravation or congestion of some vital organ?

The peculiar effect of atmospheric changes is sometimes inexplicable. There is the record of one woman who climbed the Alps with comfort and pleasure, but who upon making an ascension of a thousand feet in a balloon succumbed to nausea and dizziness, so that when she descended her life was saved with great difficulty. Another enterprising woman, who had a perfect horror of high altitudes, was carried away in a runaway balloon against her wishes, reaching an extreme altitude of several thousand feet. Returning finally to earth, with a smile on her lips, she said:

"It was perfectly delicious! I never knew before what a good time the birds have. I wish—I almost wish I could be a bird."

Physical disability and mental temperament may thus handicap some of us in taking up this new sport. We may have the money and inclination to study the world from an altitude of a few thousand feet, but nature, alas! has denied us that privilege by virtue of physical disabilities. But that fact should not make us pessimists and influence us to view with disfavor the enjoyment of others more liberally endowed with health and strength.

NEW YORK CITY.

# Vacation at Home

BY E. P. POWELL

AUTHOR OF "THE COUNTRY HOME," "OLD FARM DAYS," ETC.

HE result of a vacation conference was that we and company, that is my whole family, including two collies, lots of birds—probably fifty nests full, twenty hives of bees and a yard full of fowls—not forgetting a noble horse and a generous cow, agreed that it would be folly, during the heated months, to leave our retreat among the hills, and take a vacation rambling about the world—at the mercy of hotels, cars, crowds and clerks. You never are made to feel your utter insignificance, and how little your pleasure concerns the rest of the world, so much as when you try to get

your pleasure in competition with the vacation crowd. Never does the world elbow so impatiently; and why shall we grumble? If we have a real country home what can be better during the heated term? Here on one's own acres one is somebody. The bees are working for him; the birds are singing for him; the hens are cackling over his eggs; the cow gives her milk to him; while the collie shows her love for him, and will defend him against the world—without price. It is all beautiful. And when the sun burns one may swing in his own hammock, hear his own brook ripple, smell his own roses, and eat his own succotash and his own red astrachans.

So it came about. We tapped our vests significantly, where the pocketbook

The Old Homestead.

A Bit of Country Road.

pads the breast, and with a wink of self-satisfaction sat down to think it over. No, we will not run ourselves to death for fun—not this summer. We will wait until next winter, and when these neighbors who are vacation hunting are shivering and wasting coal we will go South and stay there till spring draws us home. We will eat oranges and sweet potatoes and fresh vegetables in January. We will make garden in November; we will swim in our own lake in February; we will chaff the mocking birds while they are nest building in March. We have no taste for blizzards; and zero has for us lost all its attractions.

June 30th—the strawberries in our garden are about gone; but Harry is sure there are some knolls over by the Palmer woods where wild ones can be found. I should like to renew those delicious sensations of my boyhood, when we pulled stems of strawberries out of the grass, enough to fill a saucer for the little mother, and enough over for a shortcake. It was slow work, but it was an education. It taught us to see things, and we found pigeon berries, and little orchids, and many other things quite as

beautiful as our huge roses and lilies, that fill our garden. The sun was just winking to us over Crow Hill. Every step was a delight; and let me tell you that the secret of enjoyment is getting it out of each step as you take it—and don't be longing for the goal. We came on a big patch of forget-me-nots in the first swale, while a little brook trickled and bubbled among the small boulders. We could see it down in the meadows, getting ready to join the big creek and help turn the mill. Then we climbed a beech crowned knoll, where we sat for awhile under the big, wide armed trees and planned an excursion, by and by, for the nuts that were forming little knots all over the limbs. Squirrels ran freely here and there, and I doubt not had the same anticipations of the future. In the hollow just beyond were big patches of mint, and as we walked thru them the odor was exceedingly pleasant. We tucked sprigs of horse mint into our pockets and crowded them down with spearmint.

It was nine o'clock when we started for home. We had forgotten that it was Commencement day at the college on the

hill, and the bands were playing. The procession was forming; and the gowns were in line; vacation for the boys tomorrow. It was growing warm, but gentle breezes came soft and sweet over the hillsides, picking up along the way the odors from many gardens. They wrapped us in ozone; they whispered of those 'way back days, when we too marched, chock full of learning (alas, there were no gowns then), and (alas, again) we do not know half as much as then. But more delightful was it to go still farther back, when our boy footprints trod these same knolls, in these same mints and grasses, and carried berries from the same vines, with hearts that knew no burden.

July 5th. We are picking currants today. The crop is fine. We sit on low stools, and most of the time in the shade. It is a wonderful thing, this bush loaded from tip to soil with crimson berries—or white. (Mem.: both of them will make red jelly.) Of all fruits not any other links us more closely with our

ancestors. The currant bush always came on with pioneering Englishmen. After it got well planted about Plymouth the New Englander who set out to conquer the continent always had this bush for company. He brought with him into New York no strawberries or raspberries, altho he found enough of them wild everywhere. About 1790 there was a string of gardens reaching on well toward Buffalo, and every one had currant bushes; and besides this it had plums—the old English horse plums and the little damsons. Plum preserves was for company, but the currants were for everyday home use. Green currant pies were delicious, made with maple sugar; for that was the sweetening that nature gave free of charge. Cherries and pears and apples came in afterward; but the blessed currant was ready to bear, and to feed the pioneer at once. These are wonderfully improved sorts that we are growing now; and I have one new seedling that stands seven feet high in the rows. No sitting down to pick them; but

The Wood Brook.

the white grape is the best to eat out of hand and sweetest for the table.

Once in a while we pickers come on a raspberry bush that has ripe berries, and it is these early sorts that are most profitable. The price for small fruits is steadily going up year by year; and however many new gardens you may plant you may be sure of a profitable market. So you see that, instead of spending money for the benefit of hotels and resorts we are having a good home time, and are adding not a little to our store. The facts are that the modern farmer can do nothing better than to have a small fruit garden alongside his corn field, to bring in ready profits, thru those months when general farming gives more work than wages. One acre of currants will give as good returns financially as five acres of corn or potatoes. A fresh barrel of sugar will be in demand, for the wise housekeeper does not let everything go to market. Every day there is an overflush that would be wasted but for the blessed tin can or the glass jar. When the picking is over with, and the last blackberry and plum gathered, the thrifty housewife shows you not less than one hundred cans of prevision and provision—comfort and food in one.

I had some pet chipmunks, whose home was in a stone wall behind my orchard. This morning I heard shots, and went quickly to prevent mischief; but I was too late. The beautiful creatures had died, to prevent some boys from "being wrapped up in cotton wool." They were schoolboys, enjoying their Saturday holiday. I thought none too pleasantly of our President's letter to General Wingate: "I am glad that you have installed in each of the high schools a target rifle practice, and are teaching the boys to shoot." I am quite certain that this rifle practice and the death of my chipmunks will go a very short distance toward defending our country in time of war. Indeed, I am more than suspicious that it will go farther to provoke a war spirit and preserve the brute force element in human nature. At any rate my pets are dead, and I am myself warlike. It was a brute force age that discovered its need of gentlemen; and it is more gentlemen

that we still need. There is no mistake in that word. It defined the Raleighs and the Harry Vanes; men capable of stout deeds, inspired by loving kindness. It was this sort of spirit that begat sympathy for the under dog. It did not find pleasure in kicking him. It brought in the new age that has extended the Golden Rule to the slave and the Chinaman. The opposite spirit must not regain control in business, politics or pleasure.

Instead of fitting your boy with gun and rod for his vacation let me suggest a safer plan; safer morally and manfully. Give him a tutor as companion who is in love with nature, and set them loose on a botanical and entomological tramp. My word for it they will get more pleasure and something besides—that is strength of character. They will come back to you with companionship and warm hearts. The vacation will not have ended in mere sport. It will not have rubbed off the fine blush of native sweetness and sympathy that belongs to every decently born boy. John Achorn says that a right sort of fellow does not go to the woods to hunt and fish beyond his physical needs. "The trees are his brothers; the earth is his mother. He feels that he is an integral part of the world in which he lives." If rightly trained he will find in the woods the spiritual as well as the material. The best schooling a boy ever gets is out of school.

Vacation is just as important to term time as term time to vacation. Is this effeminacy? I do not believe it.

Each one of our excursions is enlivened and made doubly charming by the companionship of our collies, Togo and Foxie. Indeed, they come to us and invite us to take a ramble. Sometimes we go simply to please them. This sympathy between our domestic animals and ourselves should be cultivated. I should like to bring myself into the kindest relations to all sorts of animals that are not necessary foes. If dogs and cats and horses did not like me I should be suspicious of myself. I want my horse to whinny at my approach, and I want my dogs to like my companionship. Even my hens I find can be humanized. I have some that walk about and talk with me; indeed, there is no domestic creature

that has a better command of language. We can hardly carry this sympathy too far. It is possible to create a country home full to the brim of good will; every animal and every fowl, like every fruit, being at its honest best. Even the birds and the bees become cordial and friendly.

We have done too much in the way of brutalizing animals, even from a scientific standpoint. Three-fourths of the cross-breeding has had no definite aim for the well being of ourselves or the creatures we have bred, often giving them only unnatural forms and qualities and characters. The collie dog, Morgan horse and Ayrshire cow are among the rare exceptions. In these cases we have developed brain and body together and ennobled the creatures that we have worked upon. I have not a doubt but that we shall hereafter devote our energies more wisely; will abhor the monstrosities that we are now creating and petting and will tolerate only companionable beasts. When I was a boy I studied Cæsar on war and Horace on the art of poetry; but better than these, and the algebras and the rhetorics, was that lesson, when my father took me with him to graft wild cherries with sweeter sorts, "For the birds, my boy." It taught me early to say, I will never seek pleasure at the cost of pain.

July 15th. There is a splendid fellow over on Crow Hill; and he is only there Sundays; that is the only day when he can get out of the city. He has come over the valley, and we shall spend the day together, under the apple trees, in hammocks, reading Nero and discussing John Uhl. Then we have something like half a dozen hobbies between us, which will put life into the rest of the day. By all means have a friend who has hobbies; they are worth far more than conventionalisms. There is nothing finer in

this world than a friend with a fresh heart and a lively imagination; who will be himself and not somebody else; nor made up of pieces and bits bought of the sly bidders or the noisy auctioneers. One day with a real man is worth a year with the crowd. I would not exchange this day for a month at the resorts. So it is home vacation is not without its social side. We have discussed the tariff; and universal co-operation, with commercial free trade; a new creed of life, based on modern science; the sacredness of the body in the light of evolution; the advisability of a meatless diet—all questions concerning individual freedom.

July 31st. Voted to have a day of frolic—opening with a few games of croquet, and then just a romp, with care thrown to the winds. We had in a couple of girls from our neighbors' families who love nature—"Just old Mother Nature with her sunbonnet on," as one of them says. Being watermelon time we add a huge thirty pounder to our baskets of berries and sandwiches. The orders are to bring nothing back. No plan. Where are you going? Don't know—as the spirit moves—this is a Quaker picnic. The dogs bark; the girls laugh; and the boys are very manly. Why shall not the ears and the eyes lead us once in a while? We shall come out just as well at the close of the day; and just as surely reach home. Wonderful word—the gathering-place.

Tomorrow the month is up and term begins. It has been a first class vacation. We have spent little and have earned much—happy most of the time and comfortable all the time. We held a family meeting this morning and voted: Resolved, that hereafter this family will not be banged about in public places with a crowd, but will spend its vacations at home.

# Literature

## Outdoor Books

AMONG the books of the season on open air sports is Holder's *Life in the Open*,<sup>1</sup> is foremost on account of its typographical beauty, comprehensiveness and practicality. Southern California is, in the opinion of Mr. Holder, nothing less than a second Paradise, and, in accordance with the authority granted to the first men in the first Paradise, he gives instructions for exercising "dominion over the fish of the sea and over the fowl of the air and over every living thing that moveth upon the earth." Hunting, however, has changed its object in the course of years since then, and with Mr. Holder the rod and gun is primarily an excuse for a sail or a race. In several of the chapters even these vestigial weapons are discarded, as when he goes coaching at Santa Catalina, takes snapshots of the sea lions on the islands and looks at phosphorescent fishes thru a window in the bottom of a boat at Ava-

<sup>1</sup> LIFE IN THE OPEN. Sport with Rod and Gun, Horse and Hound in Southern California. By Charles Frederick Holder. New York: G. P. Putnam's Sons. \$3.50.

lon. For more strenuous sportsmen Mr. Holder describes the hunting of the lynx and mountain lion, the chase of the jack rabbit with greyhounds and the catching of the tuna with rod and reel. He proves that in California all kinds of climate can be obtained, even in one day, by giving a series of photographs of a party picking oranges and roses in Pasadena at 10 a. m., sleigh riding and snow balling at noon on the crest of the Sierra Madre, and bathing in the Pacific at Santa Monica at 3.30 p. m.

*Camp Kits and Camp Life*<sup>2</sup> is a handy vacation volume. It is a practical guide to the hunter and fisherman, giving just that elementary advice on life in the woods that the tenderfoot needs and containing much that the most experienced camper would profit by reading. The author, best known to golfers by his alias "Niblick," begins with how to choose and carry and shoot a gun, proceeds to give directions on hunting all kinds of game from ducks and grouse to bears and deer, and closes with a chap-

<sup>2</sup> CAMP KITS AND CAMP LIFE. By Charles Stedman Hanks. New York: Chas. Scribner's Sons: \$1.50.

Stealing to a Bunch of Ducks. From Hanks's "Camp Kits and Camp Life."

Copyright, 1906, by Charles Scribner's Sons.

ter on camp medicine and surgery. One of the most valuable chapters to the amateur is that on the art of cooking out of doors with a number of recipes. The book is handsomely illustrated with photographs printed in green.

Bass are spawning now, and the en-

thusiastic angler must wait a few weeks before he attempts his first catch of the season. He will be doubly impatient to take down his rod and wander forth to try his luck if he reads this extremely interesting work, with its richness of descriptive detail and illustration concern-

Native Palms Near Palm Springs, California. From Holder's "Life in the Open." Putnam's.

ing that supreme delight of the true fisherman—the bass. Compared to the bass all other catches are tame, for the bass is both an impudent and an ingenious fish, lightning-like and ferocious in seizing hold of the alluring bait and wily and strategic beyond all other fish in trying to disentangle itself after it has been hooked. Its artifices in attempting to get back its freedom and the heroic fight it puts up endear the bass to the angler, and it is with blended admiration for the scaly one and satisfaction at having finally landed it that the fisherman carefully

capricious, one day demanding minnows, another hellgramites, on a third crickets, at other times luscious young frogs, and thus on. The wise angler takes along as complete a bill of fare as he can; if one dish is scoffed at, another may attract.

The author of "The Desert" has a gift for painting with words steeped with color. The sea to him is not simply "blue" or "green" or "angry" or "fishy"; it has innumerable quivering shades of prismatic light, and countless moods, ranging from serenity to fury. It has an opalescent temperament as well

Fishing for Bass. From Harris's "The Basses, Fresh Water and Marine." Stokes.

puts the capture in his basket, after having, with a due sense of pride, ascertained its weight. The development of the basses of all varieties is fully told in *The Basses*<sup>3</sup>—how they breed and live and what they eat, their habits and tricks, what the most tempting bait is, and where good places are to catch them. The bass, at least the fresh water bass, has a peculiarly puzzling and dainty way of variegating its food. Its appetite is extremely

as an iridescent surface. The history, the poetry, the science and the endless aspects of the sea are given in a style which will charm all lovers of the ocean as well as interest any reader who can feel the allurements of gull winged words, that turn edges to the light, a white flash against cloud or wave. *The Opal Sea*<sup>4</sup> will bring a salt whiff into the vacation days wherever spent, whether on plain, or mountain, or by the sea itself.

To the traveler with any curiosity—

<sup>4</sup> THE OPAL SEA. By John C. Van Dyke. New York: Charles Scribner's Sons. \$1.25.

Western Columbine. From Henshaw's "Mountain Wild Flowers of America." Ginn & Co.

and the person who has none has no reason to travel—it is very annoying to see strange wild flowers and not be able to find out their names and relationships. Guides and country people are apt to know only local names or none at all, and not every one is able to handle a manual of botany with ease and readiness. To such tourists Mrs. Henshaw's *Mountain Wild Flowers of America*<sup>5</sup> will be useful, for it contains a hundred full page pho-

tographic illustrations which will enable many flowers to be recognized at a glance. The classification is by color and there are popular as well as scientific descriptions, so even one ignorant of botany will be able to make use of the book.

**Bob and the Guides.** By Mary Raymond Shipman Andrews. New York: Charles Scribner's Sons. \$1.50.

A book of Canadian hunting stories, which can be read aloud and out of doors, two severe tests for a book. Most

<sup>5</sup> MOUNTAIN WILD FLOWERS OF AMERICA. By Julia W. Henshaw. Boston: Ginn & Co. \$2.00.

of them and the best of them are told by Bob, a thirteen year old boy, to whose amusing literary style no description by a reviewer can do justice. Therefore we quote the paragraph by which Bob introduces his two grandfathers, the Bishop and the Judge, who, by the exigencies of outdoor life, were led to vio-

making a fuss over him and loving him, though he doesn't care at all, as he shouldn't, for that's all stuff and nonsense. But kids are crazy over him and come around kissing him, which, to me, is disgusting, and he is regarded by many, in fact, in the light of a dummy-god. But the Judge is different. He's more deliberative and is always in a good humor, but never excited, and talks slower and uses longer words and doesn't chuckle as much.

Bob's Grandfathers Try Stunts. From "Bob and the Guides." Scribner's.

late their most stanch principles by, respectively, fishing on Sunday and shooting game out of season:

"Now although I have talked about my grandfathers *en masse*, I'd like you to understand that they are in reality very varied characters. The Bishop is like lightning at seeing funny things and saying them, and he can snap out two syllables of sarcasticness that will make the proudest wriggle. When he tells his views he does it quick and hard, in little, short words, and people are always

As to physique, both of them carry too much weight to be any good at track athletics. They are both of a very sweet disposition, naturally—at least the Judge is, and the Bishop fairly—but up in camp they got actually frisky and played jokes and went in swimming, and tried stunts like chinning themselves and lassoing each other and a lot of really interesting things like that, instead of sitting in arm chairs like most elderly gentlemen, talking about the warmth and the coolth, and politics and dead people, and acting way down in the pit of the dumps. In this state of preserva-

than they were really a pleasure to have around camp, which is saying a heap for anybody."

**For the Soul of Rafael.** By Marah Ellis Ryan. With marginal decorations and photographic illustrations. Chicago: A. C. McClurg & Co. \$1.50.

In this romance of old California the utmost has been made of the picturesqueness of its place and period. Each chapter is headed by a few lines of Spanish or Indian music, the pages are decorated with borders and initials of Aztec design in tint, and the illustrations, separately

printed and semi-detached, are from photographed groups and scenes about the old Spanish mission of San Juan Capistrano, where Mrs. Ryan lives. Evidently these illustrations are the result of a labor of love, and certainly they are a great improvement over the ordinary pictures in novels, for these are apt to be drawn by artists, who know nothing of the costumes and scenes described, and in some cases have obviously not read the book they are "illustrating." The three-color cover design is not a success. The elaborate decorations of the book

From Ryan's "For the Soul of Rafael." McClurg.

have the advantage of distracting the attention of the reader from the literary quality of the story itself, which is a somewhat crudely told melodrama of an Aztec curse and a stolen jewel, of witchcraft, bigotry and race conflicts, in which dark-eyed señoritas, Spanish cavaliers,

was in the field as a war correspondent in Cuba, China and the Philippines, and has traveled extensively. He has drawn on his trip to the Orient for two of these stories, while the rest are tales of the water. "The Praying Skipper," the first of the collection, is the story of a religious

The Shipwreck. From Paine's "Praying Skipper." The Outing Publishing Company.

Indians and American heroes play their appropriate parts in appropriate costumes.

**The Praying Skipper and Other Stories.**  
By Ralph D. Paine. The Outing Publishing Co. \$1.50.

Mr. Ralph Paine is a graduate of Yale in the class of 1894. For eight years he

captain whose actual ability is doubted by the young manager of the line. The skipper proves that he is not yet a case for the retired list, by steering the ship thru a storm, with the rudder gone. He stands, with a broken rib and ankle, by the indicator thru the long night, using the twin screws to keep the bow to the seas. "A Victory Unforeseen" gives a

good picture by a man who has himself rowed the course of the races at New London. The end of the story seems a trifle overdone, where Jack Hastings's mother is made the heroine of the banquet. "The Last Pilot Schooner" is a good story. James Arbuthnot Wilson, a

old log book, and when he reports at the office and Doc Wilson asks for his notes, young Wilson finds he has the courage to flatly refuse. He hands his story in to the editor, and next day rejoices in his first full page. The stories are well illustrated, especially "The Victory Unfore-

Chip Reaches the Camp. From "The Girl from Tim's Place." Lothrop.

green reporter, gets a note, intended for Doc Wilson, a veteran of the staff, which assigns him to write up the last trip of an old pilot boat. He discovers the mistake on his reception by the real Wilson's friends among the pilots, but decides to stick the thing thru. The rough handling and the shipwreck change him from a weakling to a man. Coached by a pilot he writes the story of the cruise in an

seen," with F. X. Leyendecker's crew pictures.

**The Girl From Tim's Place.** By Charles Clark Munn. Boston: Lothrop, Lee & Shepard Co. \$1.50.

A story of the Maine woods, with a girl named "Chip" as its heroine ought to be good summer reading. It has a sassafras bark flavor and a woodsy fra-

grance about its pages. "The more I see of the world, the better I like the woods," is the conclusion of Old Cy Walker, the sylvan philosopher, scout and protecting genius of the camp; and the Maine wilderness is a fascinating place in which to lose oneself, with its shy lakes and interminable pines, yet it would be hard to find worse men in the world than the villainous father of Chip or the half-breed Pete Bolduc. It ought to make

Walker, who does many wise things and only opens his lips to let fall apothegms, such as: "I jest nachly hate a person who talks as tho he'd bin measured for a harp." "The man that won't bear watchin' needs it." "A miser was created to prove how little reel comfort can be got out o' money." He is of the type of "Eben Holden" and "David Harum," and is destined to be popular with the great public, which relishes bits of wis-

ELINOR MACARTNEY LANE.

Author of "All For the Love of a Lady," "Nancy Stair," "Mills of God," etc. From the miniature by Sara N. Bartle.

people better to live in the woods, but the secret of sin is not in the keeping of landscape or of climate—its source is in the mysterious heart of man. Fortunately for us and for the story there are, also, good people everywhere, and in the Maine woods in particular, and the poor little "Chip" finds friends during her brave flight from dishonor and in her struggle for an education and an up bringing better than her birth had marked out for her. She has courage enough and pride enough for several heroines. The hero is less attractive, and the real character of the book is Old Cy

Walker, who does many wise things and only opens his lips to let fall apothegms, such as: "I jest nachly hate a person who talks as tho he'd bin measured for a harp." "The man that won't bear watchin' needs it." "A miser was created to prove how little reel comfort can be got out o' money." He is of the type of "Eben Holden" and "David Harum," and is destined to be popular with the great public, which relishes bits of wis-

**All for the Love of a Lady.** By Elinor Macartney Lane. New York: D. Appleton & Co. \$1.25.

A hammock historical novel which will serve to pass away very pleasantly an idle hour on some summer afternoon. It is a tale of chivalrous love and dastardly conspiracy told with the grace that we should expect from the author of "Nancy Stair." The heroes of historical novels who foil the villains and rescue the ladies have been getting younger and younger

of late, but in this story the tendency has probably reached its limit, as the two heroes who perform these deeds are Scotch lads of nine years old and rising. The book is prettily decorated with pen sketches.

**The Spirit of the Pines.** By Margaret Morse. Boston: Houghton, Mifflin & Co. \$1.00.

*The Spirit of the Pines* suggests "Our Lady of the Beeches"; it has the wood aroma about it, and the lovely lady who is called the "Spirit of the Pines" is a nature worshipper to the verge of fanaticism. Much of the story is told in letters, well written and frankly egotistical as such missives should be; there is a love theme running thru, a sharp sorrow, a keen joy and a great renunciation, and the music of the pines is an ever recurring refrain to the pretty and pensive idyl. It is a good book to slip into the pocket this summer and read upon a couch of soft, springy and fragrant pine needles with the sigh of pine branches above one's head.

**The Lake.** By George Moore. New York: D. Appleton & Co. \$1.50.

*The Lake* is the mirror of a man's heart. That the man is an Irish priest and his life set in a sequestered parish by one of the wistful Irish lakes is an accident; the tragedy is universal where a soul like that of Father Oliver Fogarty is in question; a spirit so refined, delicate and intense as his is sure to bruise itself against life wherever it may be housed. The musings of the lonely boy merge into those of the lonelier man. His mind is laid bare for our reading, and it is a mind singularly interesting and pure; the non-Catholic might well cross himself before looking into it. A young girl in his parish, who teaches the children and plays the organ and has grown dear to him, goes wrong, is sternly rebuked in public by the priest, and disappears. He fears she may have drowned herself in the lake and he haunts its shores in an agony of remorse. The news of her safety in London comes to him with a shock of delight, and he pours out his grateful heart in the first of a series of remarkable letters which make up much of the bulk of the book. His love for the woman he had injured glows

thru every line he writes to her, yet he is himself unconscious of it. Her letters are more complex, as her nature is a lower one than his; more superficial, and swayed by conflicting currents of feeling and impulse. Part of the pathos lies in the fact that Rose is not what her lonely lover dreams her; she is not extraordinary to us, tho she represents all the beauty and joy of life to the priest. In fact, she is a selfish, impulsive creature, not a little cruel in her revenge. She means to make him suffer, and he does; she uses all her arts to fascinate him by means of her charm, thru jealousy, in every way she can concoct in her mean, selfish, little soul. He thinks of her as a "pagan," yet she has a more than pagan lack of moral sense. He says to Father Moran: "Woman is the danger. The Church dreads her. Woman is life." And the one human being who represents "Life" to him is this pretty, spring-like, wayward, hopelessly conscienceless Rose, whom he idealizes into a heroine, because she is beautiful and because he has wronged her and because he has a poet's soul! She is so unworthy of his dreams that we resent her power to unsettle his faith and drive him forth to an untried life in the New World. He has a tenderness for her deserted child, whose father he cannot guess; she seems to have none. The two natures meet only thru letters, and somewhat formal ones, yet the effect of one soul upon another was never more powerfully portrayed. She is to him no longer a sinner to be saved, but a nature-goddess, who is incapable of wrong. Her freedom calls to him, restrained as he is by a hundred ties to parish, to custom, to duty. He swims across the lake to find freedom for himself, and the book ends with a question: "Will he find it?" For freedom is not an external thing, to be sought and won afar. "There is a lake in every man's heart" are the last words we hear, as he sets his face westward to New York, while Rose is wandering in Eastern Turkestan in quest of "the source of the Christian River." Evidently Mr. Moore has prepared the way for a sequel, as he did when "Evelyn Innes" became "Sister Teresa." *The Lake* is in many respects the converse of that story. The central character—for

Moore's novels are really biographies—is a man instead of a woman, and the transition is from the Church to the World. Evelyn began life as an opera singer and ended it as a convent teacher. Fogarty began as a parish priest and he became—we know not what—apparently a New York politician.

## Literary Notes

FOR the beginner who wishes to learn how to shoot, either at target or game, Walter Winan's little manual on *Practical Rifle Shooting* (Putnam's) will be found of great assistance.

....Mr. Cleveland's articles on hunting and fishing, which have been a feature of our Vacation Numbers for several years, are soon to be published in book form by the Outing Company.

....A very practical manual for the amateur is *The Seasons in a Flower Garden*, by Louise Shelton (Scribner's, \$1). It is arranged as a calendar, giving detailed instructions as to what to plant in each month of the open season, with many useful hints of a miscellaneous character.

....*Ten Thousand Miles in a Yacht* (Dutton, \$2) is an unpretentiously written narrative by Richard Arthur of a three months' trip around the West Indies and up the Amazon into the rubber regions of Manaos and Pará. The introduction, by Wm. M. Ivins, is worth more than the rest of the book. The numerous photographs are interesting.

....The difficulties and delights of automobiling in France and Switzerland are described by Winthrop E. Scarritt in *Three Men in a Motor Car* (Dutton, \$1.25). The practical advice he gives, and his discussion of the present conditions and future prospects are of more interest than the description of the conventional sights and the usual automobile humor.

....Professor Bailey's excellent book on *Plant-Breeding* (Macmillan, \$1.25) has passed into its fourth edition. It deserves its success because it is an authoritative, readable and comprehensive account of the way the miracles of modern horticulture are being accomplished. New species are now not discovered; they are invented. The plant inventor decides what kind of a fruit or grain he wants and then goes to work to make it.

....Just as the early landscape painters always put a few persons in the foreground of their pictures to add "human interest" to scenery, so our modern horticulturists find it advantageous to mingle their directions for a rose garden with some light conversation and gossip personalities. Barbara, well known as the Commuter's Wife, does this very pleasantly in her latest book, entitled *The Garden, You and I* (Macmillan, \$1.50). She tells how to raise flowers and how to arrange them on the dinner table; how to make the

most of suburban patches and short vacations; how to raise pinks and children, and how to manage hollyhocks and husbands.

....A most noteworthy addition to Silver, Burdett & Co.'s list of school and college texts are *The Silver-Burdett Readers*, by Ella M. Powers and Thomas M. Balliet—a series of five readers, especially distinctive in the skill with which they have been graded. *The Silver Series of Language Books*, by Albert LeRoy Bartlett and Howard Lee McBain, a two-book series in which English grammar is simply and logically presented on the inductive plan. The first book, *First Steps in English*, provides attractive language work for primary grades and lays a firm foundation for a later, more scientific study of grammar. *The Quincy Word List*, by Frank E. Parlin, A. M., is a sensible spelling book that *teaches* spelling, and furnishes valuable elementary *word study*. Two important new arithmetics (The Standard Series of Mathematics) are *The New Elementary Arithmetic* and *The New Advanced Arithmetic*, by John W. Cook and Miss N. Cropsey. The former book, intended for use in the third, fourth and fifth elementary grades, contains an abundance of carefully graded exercises designed to develop the subject systematically and to train pupils to think in number, and the latter book is fairly representative of what is best and progressive in present day methods.

## Pebbles

OF all sad words that come to hand,  
The saddest are these, "Dear sir, you're  
canned."  
—Chapparral.

"THIS is a sore trial," said the mother bird,  
as the fledgling flew from the nest for the first  
time.—*Cornell Widow*.

"AHA!" cried the tomato, as the flannel-  
trousered youth seated himself upon it; "I've  
spotted you at last."—*Cornell Widow*.

OUR Willie let a bullet fly  
Up to the azure dome;  
In after years when he got there  
He found the shot went home.  
—Chapparral.

MATH. PROF.—"The examinations are in the  
hands of the printer. Are there any ques-  
tions?"

Chorus—"Who's the printer?"—*Cornell Widow*.

TEACHER—"What is wrong in this sentence:  
'The horse and the cow is in the garden.'"

Johnny (after observing the sentence closely  
for several minutes)—"Why, the lady ought  
to go first."—*Princeton Tiger*.

TEACHER—"What are marsupials?"

Boy—"Animals which have pouches in their  
stomachs."

Teacher—"What do they have pouches  
for?"

Boy—"To crawl into and conceal themselves  
in when they are pursued."—*Figaro*.

## The Moral Crisis

It is not easy to keep unimpaired our faith in the moral integrity of the American business community in these days of worse and worse revelations. The record of disclosures has already become appalling, and those who know what is below the surface tell us that the depths of iniquity have not yet been sounded. Yet, somehow, our faith does abide. We believe that the American people is still, in the main, a just, an honest, and a kindly people, still rich in unexhausted moral energy. We are passing thru a moral crisis. We shall emerge from it a cleaner and a stronger nation. Before we indulge our optimism, however, let us look a few facts in the face.

It was just eight years ago, in June, 1898, that Congress created an Industrial Commission, and charged it with the duty "to investigate questions pertaining to immigration, to labor, to agriculture, to manufacturing and to business, and to report to Congress and to suggest such legislation as it may deem best upon these subjects." The testimony taken by this Commission, and reported, imperfectly in the newspapers, officially and in great detail, in a series of elaborate volumes, opened the eyes of the public to the fact that injustice in the business world was more serious and more extensive than even the writers of radical party platforms, like those of the Populists and the Bryan Democrats, had alleged.

The greater part of the material obtained by the Commission had been put before the public by the year 1901. During the five years that have since passed, one investigation has succeeded another, and the literature of exposure has given publicity to all manner of disclosures, clothed in a sensational garb, that has arrested the attention of the thoughtful and the thoughtless alike. From the enormous mass of data accumulated, one generalization stands forth in startling relief. It is this: *There has not been one investigation of corporate conduct, of the relations between corporations and*

*Legislatures, of the conduct of individual public men, that has vindicated the defendant; not one that has failed to reveal an amount and degree of wickedness far worse than the public had suspected.* In view of this terrible truth, it is vain to inveigh against the "muck-rake" man. The jester who suggested that the only legitimate criticism to be made upon the muck-raker was that he should have used a steam shovel, had the true sense of proportion.

It is idle, then, to waste time in denying or in blinking our present moral undoing. The time has come to inquire into causes, and to seek the ways of regeneration.

Already our social philosophers are offering explanations. The writers of exposure themselves have attached chief importance to the relation between privilege—including franchise rights—and corporate greed. Mr. Ghent, as a consistent Socialist, in his recent contribution to THE INDEPENDENT'S columns, insists that graft is inherent in the competitive system. So long as men must jostle one another in the market to obtain economic standing room, so long will they take unfair advantage, just as do men and women who, in the ordinary walks of life are well behaved, when, in the nightly crush at the Brooklyn Bridge or the Subway stations, they forget every instinct of decent breeding.

Our own view of the causes and conditions entering into this tremendous problem is probably no wiser than that of other writers, but such as it is, it is more radical even than Mr. Ghent's, because it goes back to conditions and forces that are antecedent to the competitive system itself, as that system is found today in the United States. There is no reason to suppose that competition among men of substantially equal strength, cleverness, and resources, could work either economic or moral harm to anybody. The principles of a *laissez faire* political economy would probably all be vindicated in a society of economic equals. But competition becomes a terrible cruelty, a shocking

waste, in the economic realm, and soul-damning in the moral realm, when the weak are pitted against the strong.

In the Northern States of America, before the Civil War, there was a rough approximation to equality. The boundless natural resources beyond the Mississippi were not even explored, and the population, still chiefly of English, Teutonic and Celtic stocks, was but slightly differentiated. There was comparatively little accumulated capital. Today, we are exploiting, ruthlessly and wastefully, the most marvelous resources ever found at the disposal of any people. Unlimited capital employs a grade of ignorant, common labor, which existed formerly in the United States only in sporadic individual specimens. Gigantic power, on the one hand, human helplessness, on the other hand, together extracting the gifts of nature from the earth, have created fabulous wealth for men who have never been forced to toil; as the pioneer and the colonist toiled, who have seen in risk, industrial adventure, speculation and exploitation, infinitely greater potentialities than men have ever found in industry and thrift.

And these conditions have turned men's heads. They have seared men's consciences. They have created a nation bent on getting something for nothing; a nation unmindful of the duty of putting into the common store as much as one takes out of it; a nation, in short, of industrial and commercial gamblers.

Inevitably this attitude of mind and feeling, born of an exploitive stage of industry under conditions of increasing inequality has been carried over into the older realms of business and politics. Used to obtaining something for nothing by the bounty of nature, men have continued to demand something for nothing by the bounty of Legislatures, and to obtain it thru the machinery of a complicated business organization, with its endless possibilities of secret contracts, deals, and crooked accounting.

Believing that this account of causes is substantially accurate, we are necessarily optimistic because the causes that have produced our wickedness can no longer operate as heretofore. Already we have reached the point of diminishing return. Our prairies must hence-

forth be fed with nitrogen. Our forests have been felled and wastefully consumed. Our mineral products are brought to the surface at increasing cost. There is no new El Dorado beyond the sunset line. The opportunities to get something for nothing by nature's bounty will soon have been exhausted. An increasing resistance of an awakened public opinion will meet the fortune hunters who look to law-made graft. The Napoleons of finance will have to go to work like other men, or like other unproductive men, embrace a life of poverty, chastity and obedience.

In the last analysis, it is the beneficent economic law of diminishing returns that accounts for all human progress, intellectual and moral, no less than materialistic. We shall emerge from our moral crisis an industrious, honest, and humane people, because we shall inevitably arrive at the stage where a given amount of enjoyment in terms of knowledge, social-bility and kindly deeds can be obtained for less exertion than an equivalent amount of satisfaction in terms of material luxury and swagger. The diminishing returns of materialism will happily direct our thoughts to justice, mercy and good manners.

### The Sins of the Packers

WHEN the Chicago packers permitted the Beveridge bill to be passed in the Senate without a word of protest or criticism they were under the control of wise counselors. But when they thrust these counselors aside and set Lorimer and Madden and others at work in the House to make the bill worthless, they exhibited a stupidity that is equaled only by their heartless greed. This action hastened the publication of the Neill-Reynolds report. The first part of that report is now before the people, with a message in which the President points to the revolting character of its disclosures. Other parts are yet to come. None of them will be suppressed. But this first part is enough to convict the packers before the tribunal of public opinion.

It should compel an immediate acceptance of the Beveridge bill by the House. It should subject all who oppose that bill

to the source of public contempt, even if their number includes the Speaker himself. Every member from Illinois should at the beginning have accepted gladly a bill designed not only to protect the consumers of Chicago products, but also to assist that city and their State in freeing themselves from the disgrace due to local misgovernment. Both the State and the city have miserably failed in their duty to the millions elsewhere who buy Chicago meat products, and also to their own people.

Perhaps it could not reasonably be expected that Mr. Lorimer and Mr. Madden would accept a measure distasteful to the combined packers, but we cannot understand why Mr. Cannon consented to give them the assistance of the slightest sympathy, and the reasons for the attitude of Mr. Wadsworth, of New York, are beyond our comprehension. We have examined the provisions of the substitute bill which these gentlemen, or a majority of them, have prepared. It is a bill that should be laid aside at once. Surely it cannot survive the sledgehammer blow of the President's message and of even that small part of the Neill-Reynolds report which is now public property.

We print elsewhere a summary of this preliminary report, omitting, however, certain striking passages of it which are not suitable for our pages. Shocking as it is, and painful to all who desire to be proud of American industry and decency, we believe it to be much less than the whole truth. Why? Mr. Neill and Mr. Reynolds have done their task conscientiously. This is beyond question. But after the first recent attack upon the packers' methods, and before this inquiry, there was time for some hasty improvement of conditions. For various reasons Mr. Neill and Mr. Reynolds rejected many affidavits and much documentary evidence offered to them, and confined their report to facts verified by their personal investigation. Thus they were on the safe side. But since Mr. Sinclair's book began to be talked about, and even since the Beveridge bill was introduced, the press has published a great mass of testimony bearing upon the abuses which engaged their attention for two weeks and a half.

How much a considerable part of this testimony is worth we do not know. But we give much weight to the statements of such men as Dr. W. K. Jaques, Dr. J. C. Milnes and Dr. W. P. Cutler. The first of these was city bacteriologist in Chicago for eight years and had charge of the municipal inspection of meat. He it was who recently conducted Mr. Reynolds on a tour of inquiry in the stockyards. Dr. Milnes was employed in both the Federal and the municipal inspection services at Chicago and Kansas City. Dr. Cutler, now food inspector at Kansas City, was for several years in the Federal inspection service there. Their statements as to matters within their own experience point to abuses which the preliminary Neill-Reynolds report does not touch, abuses permitted sometimes by municipal inspectors, sometimes by those whom the Government employed. It is on account of such evidence that we believe the whole truth to be more shameful than the statements of the report, which we also believe was prepared carefully and conscientiously. But there is enough in the report to show why neither Mr. Sinclair nor his publishers have been sued for libel.

This was, in a certain sense, an unofficial investigation. A thoro official one is now needed. The Beveridge bill, if enacted, will be effective with respect to meats for interstate trade. Complete exposure and publicity, supported by official authority, are needed in order that legislation and inspection for the protection of local consumers may be promoted. In some places there may already be seen the stimulating and beneficial effect of such publicity as we now have. Philadelphia has discovered that she has 171 unlicensed slaughter-houses and only five inspectors. Her health authorities admit that a great majority of these 171 places are in a very deplorable condition. They are a continual menace to the public health; the city newspapers publish alarming stories of the food supplies that come from them. There are to be new sanitary regulations, to which these butchers must conform or go out of business. Publicity will cause reform in other cities, even in Chicago, where enlightened municipal inspection is needed to make the proposed inspection for

interstate traffic effective and to inspire confidence abroad in our Federal inspection for the export trade. Parts of the Neill-Reynolds report show that this Federal inspection is not what it should be; other parts, relating to the unsanitary conditions prevailing thruout the packing-houses, justly expose to suspicion all products of those houses, whether intended for consumers abroad or for the American people. The work of exposing the sins of the packers should not stop with the publication of all that was ascertained by Mr. Neill and Mr. Reynolds at Chicago. To protect the health of our own people, to preserve our export trade, and in defense of the good name of American industry, all the packing-house muck should be raked out and purified.

### Good Men in a Bad Way

QUITE as startling as the revelations of graft in the insurance companies are those in the highest circles of management of the Pennsylvania Railroad. Now, the Pennsylvania Railroad has held a reputation for the wisest and shrewdest management of all our railroad companies. It has been the example to which English students of internal commerce have referred. We recall that when several years ago the *London Times* sent a correspondent to this country to learn how American methods had come to be so far in advance of the English, he devoted his investigation to the Pennsylvania Railroad, and showed how it sent to the scrap-heap its old engines as fast as it could get better.

Equally it has been supposed that this railroad had conducted its business with fairness and honesty. Most reputable men were supposed to be those who were its officers. They were men of credit in Church and State. So much more is the surprise and pain to discover, thru the sharp investigation of the Interstate Commerce Commission, that they are no better than the very reputable men of the insurance companies, whose masks have fallen, and who have been driven out of the offices which they had used for their personal emolument and not for the benefit of the companies they controlled.

It is no new lesson, but a very pain-

ful one, to learn that activity in religious work does not assure conscientious integrity. We will take one man as an example, by no means the only one, but the one most prominent in this matter.

Mr. William A. Patton is the assistant to President Cassatt. He admits, and, he says, without shame, that, without paying a cent for it, he has become owner of \$307,000 of par stock of coal and coke companies, some of which, as other evidence proves, have received exceptional favors from the Pennsylvania Railroad Company. He says that most of this he acquired thru the part he took in organizing the companies, and in some cases giving his notes to protect their bonds. But, naturally, there was never any loss; there could be none, for they were favored by the railroad to the injury and loss of competing companies in which Mr. Patton and other officers were not interested. That is, because he owned this stock, costing him nothing, he could make a large profit in its dividends; said dividends depending on the railroad's partiality to them as against other shippers. He had his salary for honest service of the Pennsylvania Railroad, and he used his position to fill his own pockets. This is very wrong before God and man, taking profits for himself which would have gone to others if they had not been, as is shown, shut out from the market.

Now, who is William A. Patton? He is an elder in a Presbyterian Church, has been for a dozen years, and more, superintendent of its Sunday-school, and is a member high in the international councils of the Young Men's Christian Association. He has been regarded, and, we may presume, has regarded himself as being a model Christian man, an example to the world of honest thrift. But was he?

The easiest way to explain such lapses is to suppose that we are developing a higher ethical sense, and that such men have lived and thriven in an earlier competitive age before it was learned that these practices are wrong. Just as good religious men were engaged in the slave trade a hundred or more years ago, and later were defending slavery, and just as nowadays the brewery is, in England, the ally of the Church, so it was in those

dark ages thought to be quite right to pick up what one could grab as he walked along the king's highway. There is a certain measure of truth in this contention and excuse, for the moral sense of the world is all the time growing. We are beginning to think even war is not an honorable business. One of these days we may think of great soldiers as we now think of Canfield.

But this explanation will hardly do for the men of the Pennsylvania management and directorate. They have long known that they had no right to show discrimination for personal profit. It is more than a dozen years ago that this matter came up before the directors. A miner and shipper complained that he was discriminated against. His bids for coal to the company were rejected whatever their figures, and he was restricted to one carload a day. He went to an honest man among the directors, to Mr. Thaw, of Pittsburg, and Mr. Thaw was angry. He made it hot for the officers in a meeting of the board, and—will not Mr. Cassatt, who was present at the time, and Mr. Patton, look up the records, and will they not find that a vote was passed forbidding the officers of the road to hold stock in companies doing business with it? This is worth a bit of investigation.

We take Mr. Patton as an example, because he is not alone—many others might be mentioned. They are good men—so good—who can

"Teach sin the carriage of a holy saint."

With some of them their cloak of religion is pure hypocrisy; with most it deceives also themselves. But we recall that the Devil quoted the Bible in Jerusalem on a steeple, and a good authority tells us that

"A daw's not reckoned a religious bird  
Because he keeps a cawing from a steeple."

That \$307,000 may be considered only a fraction of the profit of favoritism. The local assistant of President Cassatt, at Pittsburg, has just retired, said by the papers to be worth \$20,000,000. Then Chris Magee overestimated his wealth several years ago when he introduced him at a dinner as the man who had saved twenty-five millions on a salary of \$10,000.

## Peace

It has been a week for the work of Peace. First came the dinner given in this city to Congressman Bartholdt and his associates in the Inter-Parliamentary Union. At this occasion Mr. Bartholdt, Mr. Oscar S. Straus, General Grant, Professor Rowe and other distinguished gentlemen made addresses, but we would call attention particularly to that by Prof. John Bassett Moore, ex-Assistant Secretary of State, and now of Columbia University, who, in a remarkable speech, took the most progressive ground, holding, what has been proposed by THE INDEPENDENT, that the Hague Conference must develop into a world government, embracing the three complete departments of legislative, judicial and executive control. This is absolutely ideal, final and complete, and it was an inspiration to hear this prophecy from so sane and experienced a student of public affairs as Professor Moore.

Then the scene shifted to Mohonk Lake, where Mr. Albert K. Smiley each spring gathers the hosts of Peace to combat the evils of War. It was the largest of all his conferences, three hundred guests being in attendance, and we do not know how the hospitable rooms will entertain them if the local organizations grow in numbers; for fifty chambers of commerce in as many cities sent delegations. Such boards of trade have the most vital reasons for deprecating war, and it is a happy device to attach them to the work.

But even more important is the Inter-Parliamentary Union. In this the Parliaments of the world are united, and they meet every year to advance the cause they all have at heart. Here the members from our American Congress were present, so far as their duties would allow, and Mr. Bartholdt, their chairman, formulated their plans, which were put into the platform which was adopted. Infinite credit is due to these American members for the advanced stand they have taken, and we hope they can at last persuade our Senate to accept treaties of arbitration.

During the past year the number of arbitration treaties has risen from thirty to forty-four. Of these two, those of

Denmark with the Netherlands and Italy, have reached high water mark; for they refer to The Hague all disputes without exception. Ex-Secretary of State John B. Foster called attention to the alacrity with which all the nations of the world have accepted membership in the coming Hague Conference, as contrasted with their hesitation in 1899. Then twenty-six Governments were represented; now there will be forty-seven. At present twenty-five Powers are represented by seventy-eight judges.

With all our wars we have been making progress. Cardinal Gibbons presented the amazing contrast between this country and the Roman Empire. In our 120 years we have had eleven years of peace to one year of war, while 700 years of the Roman Empire allowed but one year of peace to a whole century of war. But it is that horrible one year of war that we want to get rid of; and the platform adopted indicated the immediate effort, even if it did not go to the full length of Professor Moore's proposals. But this is implied in the proposal, of the first importance, that the Conferences of The Hague shall be held at stated periods, and so self-perpetuating. That gives it permanent influence. Such a regular court or conference will naturally absorb all the three functions of government. It will appoint a commission to formulate the law of nations, which is Legislative; and there will follow the means of punishing or boycotting a nation that disobeys them, or refuses to accept the decisions of the court to questions referred to it, which will be Executive. Next in importance to this, or equal to it, is the formulation of a model treaty of arbitration. Not quite beyond hope is the proposal of the British House of Commons, approved by the House of Lords, and now supported by our Mohonk Conference, that the question of the restriction or reduction of armaments be brought before the coming Hague Conference. Of course the provisions for the amelioration of war while it exists will need consideration; but we want more radical reform than that which cuts off the dog's tail.

Since American representatives in 1899 secured the creation of the Hague Court, and President Roosevelt gave it

actual life by sending to it its first case for decision, we have made rapid progress in the sentiment of the world in favor of peace. The progress is such that we may really hope that war will, by common consent, be abolished. This has been supposed to be the last evil to survive before the Golden Age begins. The world longs for the coming day.

*"Adspice, venturo lætantur ut omnia sæclo."*

## Our Vacation Photographs

FIVE hundred photographs spread upon the longest tables in our largest room! Sixteen pages allowed for vacation pictures! The calculation of the age of Ann and the determination of the loss of the man who gave a hat and five dollars for a counterfeit ten, become mere kindergarten work in comparison with the problem which confronted us. It was hard enough for any one of us to make up his own mind which pictures were the best; it was impossible for him, after he had succeeded in convincing himself, to convince the other two of us on whom the burden of choice fell; and as for suiting all of our readers, including among them the competing photographers, that was manifestly out of the question.

Still it had to be done, so we boldly went ahead and picked out those we liked best and that we thought others would like best, and from these again selected twenty-nine that afforded the greatest variety. We nerved ourselves for the task by the thought that since nobody except ourselves had seen all the pictures, nobody (except the disappointed photographers) would know how good were the pictures we rejected.

For, after all, it is a question of taste, and concerning such there is no common ground for argument, altho there is nothing else that people argue so much about. We can only hope that the majority of our readers agree with us in taste, and, indeed, this must be so, else they would not be our readers, but the readers of some other magazine.

Therefore, when we look over the pictures as they are printed and observe that in spite of our intention of getting a varied selection, suiting all tastes, they

really show a very decided bias and limitation, we do not, on the whole, regret it. We find that we have not included our kinds of vacations that many people like. Among the conspicuous omissions are the big summer resort hotels now crowding with vacation families; the race track, where thousands are assembling every day, to prove by the evidence of their own eyes what they knew before, that one horse can run faster than another; the boardwalk at the seaside, where, all day long and part of the night, people march back and forth listening to the roar of the sea with one ear and to that of the barker for the sideshow with the other, and the Chautauqua assemblies, where one can spend the day taking alternate lessons in Esoteric Milton, clay modeling and Hebrew syntax. But we are not to blame for not including such vacation scenes as these, for there were none among the photographs sent to us, and we promised to confine our choice to these.

THE INDEPENDENT's ideal vacation is evidently not of a very strenuous character. It seems to be spent mostly on a quiet country farm with an occasional trip to the seaside, a bit of foreign travel and a little mountain climbing. If all these pictures were fused into one, as photographers know how to do, the composite vacation would be truly rural. And our taste, which has unconsciously betrayed itself in the choice of pictures, is also shown in the space we give to articles and editorials on the joys of country life in America.

As for the prize picture—well, one of them had to be picked out. If you do not like our choice you can pick out any of the others to suit yourself. We do not care to argue about it. Still, if you insist on wanting to know why we chose it, we ask this one question: If you were to have one of the pictures framed and hung on the wall of your room for years, don't you really think that this one would last longer than the others without your getting tired of it? It is a restful picture, and a vacation is theoretically intended to be restful. Some of us enjoy lying in the shade and watching others work, but there are persons of so sympathetic a nature that when they see a man pitching hay or mowing, the sweat

gathers on their own brows and their muscles get tense. The prize picture breathes the true vacation spirit. The path thru the woods by its very loneliness, invites one to enter it for a meditative stroll. There is no object in sight that one need hasten toward; there is no magnificent view clamoring for admiration. It is the land where it is always afternoon, and that is where one should spend vacation. From a technical standpoint the two chief merits of the picture are its unity, resulting from its many perpendicular lines, and its fine gradation of shade, the shadows are not opaque and the high lights not blank. The first quality is due, of course, to skilful placing of the camera, and the second to correct exposure and development.

All of the photographs necessarily suffer from reproduction, for the half-tone process fails to give the depth, or aerial perspective, of a good print, altho it sometimes improves a poor one. "Coming Home," for example, is excellently composed, but the shadows under the bank, which are clear in the original, become too obscure in the printing. "A Mountain Home" is a well selected bit. It would be difficult to suggest how "When the Frost Is On the Punkin" could be improved upon in either posing or handling. As a very well executed *genre* photograph we would call attention to "The Net Weaver." The strong sunlight of all the Colorado pictures, especially "Camping in Colorado" and "The Last Hard Climb," should be noticed. It is the despair of painters, and only those who have tried to handle its violent contrasts will appreciate the difficulty of Rocky Mountain photography. "The Glassy Lake," with its hard, rectangular straight lines, its duplication and its blank blacks and whites, is more of a geometrical decoration than a picture, but is interesting from these novel effects, and for the impression of absolute stillness it conveys.

For the consolation of the hundred or more of our subscribers whose photographs we were obliged to return, we wish to call attention to the fact that the best photographs are those that any one could have taken. Good subjects and scenes are not rare. They are on every

hand if we have eyes to see them and craft to catch them. And that is what photography is for, to train one to know a good thing when he sees it. Don't think that the more photographs you take the better your chance of getting something fine. A good photograph is rarely an accident. Take your camera with you wherever you go for your vacation, and when you see something worth taking, take pains to take it for our next Vacation Number.

## A Baptism of Blood

"SURELY a bloody husband thou art to me," said Zipporah to Moses; and Queen Ena Victoria might well say the same to King Alfonso, for she went from the nuptial mass to a baptism of blood. The blood of her subjects slain sprinkled her wedding gown and stained her bridal shoes. Never will she wish to wear them again; and it is a welcome Spanish custom which presents them to the Virgin.

It was a horrible crime that attempted the assassination of the young King and the innocent Queen in the very hour of their festivity. What had that girl done to provoke such revenge? Even Russian Anarchists spare their victims accompanied by their wives. And if any young and popular King might escape such a fate it is Alfonso, himself too young to have earned hatred. Absolutely nothing could be charged against him, unless it be that a costly display celebrates his marriage just at the time when famine and distress afflict certain provinces. But there is no kind of explanation or defense of the dastardly deed, any more than there was for the murder of three Presidents of the United States within scarce forty years.

This is Anarchism. It has not the excuse of Nihilism in Russia, where a self-appointed court secretly condemns and kills the tyrants of the people; for Alfonso and Ena were no tyrants. Spain has a constitution of the sort the people want and create. It is the hatred of all government in general that accounts for this infamy. This murderer, who had the residual sense and grace to commit suicide, may or may not have had accomplices, but he was the foe of all law, even of the will of the people. He

hated kings, good or bad, and so he tried to kill the King and Queen, simply because of their tenure of royalty. He is the kind of miscreant of which we have had three in this country, and we know and detest the tribe.

Now what can we do about it? We remember the flood of indignation when Lincoln and Garfield and McKinley were assassinated. Even altho those were acts of individual malice we were ready to exclude all Anarchists from our shores, and we did pass laws for that purpose. But now it is not sporadic moral insanity that must be guarded against, but the plots of banded companies of conspirators, who make a religion of murdering rulers, as much as do the head-hunting Dyaks of Borneo. And they have no local habitation. They fly like gryphons or furies from shore to shore, and plot in one land the murders they will accomplish in another. The plot to kill Alfonso and his bride may be hatched in London or Naples or Geneva or Chicago, and their number grows. Who can tell how many bands or companies there are of them, confessed and secret, some of whom seek toleration because they only applaud the crimes which the few silent venturesome miscreants perform?

Our laws allow us to exclude such confessed Anarchists. They also allow us to incarcerate those who openly, in public address, urge others to commit murder. It is for this offense that Herr Most and Emma Goldman were imprisoned. We would that the whole tribe of them might be marooned in some island of the sea from which they could no more escape than could the many-murdering Napoleon from St. Helena, where they might practice the beauties of lawlessness solely on themselves, and develop their little Nihilist state, and confine their killing to their own number. But in lieu of such a Botany Bay they should be kept under the closest watch, and harried from land to land, allowed to live in peace only so long as they cease to plot and applaud assassination.

Let it be understood that we are not asking that mere silly philosophical Anarchists should be molested. A man may hold and say that a people would be

better off with no laws, but he must not propose to kill those who want laws and officers. Such people are only mildly insane and are not themselves dangerous. It is the violently insane whom it is dangerous to leave about. We would have the practicing Anarchists, the Dyaks of society, shut up or shut out. We probably have laws enough, but this murderous and dastardly crime, which has killed so many people, reminds us that our nation should combine with the nations of Europe in protecting citizens and rulers against such assassins.

## Woman Suffrage in Russia and England

Good examples of how to do it and how not to do it, in the attainment of woman suffrage, are afforded just now by Russia and England. It looks as if the Russian women would get political equality first, and certainly they deserve it more, in so far as we can judge from this side the water. In Russia the regularly elected representatives of the people, the Duma, by a unanimous vote, make the granting of suffrage to women one of their fundamental demands, and the Government is reported to be likely to grant it. In England the women are trying to make the men give them votes by making nuisances of themselves in public.

When Premier Campbell-Bannerman receives a delegation of five hundred women, and tells them, frankly and truthfully, that he personally is in favor of woman suffrage and that he thinks it will not be many years before it is brought about, they hiss and boo him to his face. They disturb the sacred decorum of the House of Commons by behaving like a lot of college sophomores on class night, interrupting the speakers with gibes and letting down a banner from the ladies' gallery. And now Mrs. Dora Montefiore has barricaded her London house against the tax collectors and bailiffs who are besieging it in order to seize her property in lieu of the income tax that she refuses to pay. The principle that taxation without representation is tyranny is a good one, but she is not likely to get it accepted by standing at the second story window and telling the

people in the street that Mr. Asquith is an assassin and Mr. Bryce is a traitor. But the English are a queer people anyway. In a country where in an ordinary election a drunken rowdy in the audience is allowed to interrupt the argument of the most eloquent speaker, and where duchesses buy the votes of workingmen with kisses, almost anything may be expected.

It would seem that even English women would know better than to use nagging as a political weapon. Women who have not found out that there are other and more effective ways of getting men to do what they want them to do than nagging, should be strictly confined to the home nest. So long as women behave like geese they are not likely to convince men that they are qualified for the suffrage. The men of the Duma did not vote for universal suffrage out of chivalry or because they had been teased, individually or collectively, to do it. It was because the Russian women had proved themselves wise and efficient in the whole course of the political movement that resulted in the Duma. They utilized to the full every opportunity opened to them in their own country for education; and when these were closed they swarmed into the Swiss and German universities, enduring exile, privation and insult with astonishing perseverance and fortitude. With their education so hardly earned they went to the people, teaching, organizing and healing among the peasants and workingmen. They have been active among all parties from the most moderate meliorists to the most extreme terrorists, and have proved their devotion to principle by voluntarily suffering imprisonment, torture and death.

It is not open to question that Russian women are capable of higher education, that they can do original work in science, that they can organize, that they can keep secrets, that they can comprehend political questions, that they can form and hold independent opinions, that they can subordinate personalities to principles, and that they can pursue a definite policy thru a long series of years to practical conclusion. It is consequently not open to question that they are qualified for the suffrage and that they will soon get it.

## A New Creed for Methodists

METHODISTS stand in a most curious and unenviable condition as to their credal statement. First come the Twenty-five Articles, which John Wesley abbreviated and amended from the Thirty-nine Articles of the Anglican Church. These are imposed on the American Methodist Churches, and the extraordinary thing is, that they rest on these Churches as a sort of accepted "dead hand," for they cannot be revoked or changed! The "Discipline" says:

"The General Conference shall not revoke, alter or change our Articles of Religion, nor establish any new standards or rules or doctrine contrary to our present existing and established standards of doctrine."

And *this* article cannot be amended! The General Conference is the supreme authority of the Church, but this dead hand rests superior to the supreme. Perhaps one of these days a pious sacrilege may remove the dead hand and assert the real supremacy of the supreme.

Besides these irrevocable Articles, Methodism has, as doctrinal standards, Wesley's fifty-eight sermons, and his "Notes on the New Testament." These he made the basis of doctrine when he passed over the rule of his churches to the "Legal Hundred" of his conference of traveling preachers. These also are held so sacred that nobody ever thinks of dropping them. And they have the same great advantage which the Bible has as creed, that they are so full and extensive that they are about equal to nothing.

Now, nobody proposes to touch the sacred and unalterable Articles. But they are long out of date. The right thing to do with them is what the Church of England has practically done with its Thirty-nine—put them away on the shelf as relics—too sacred to be thrown in the rubbish heap, but past use. That is what Professor Tillett, of Vanderbilt University, urged in his able address to the Southern Methodist Conference, in support of a new and simple creed, such as the Presbyterians have lately adopted. He said:

"They have served their purpose by the will of God, and are now entitled to honorable superannuation. I believe that they should take their permanent and their honored place

in our history of Christian doctrine, not as articles that we have repudiated, or do not still believe, but simply as articles that met our needs one hundred and twenty-two years ago, but are not now altogether adequate and sufficient for our wants."

Not that he would alter the unalterable, or remove the irremovable, nor that he would put Wesley's Sermons and Notes on a shelf with them, but that he would have a new, usable statement of faith fitted for this generation. But when Bishops Wilson and Candler opposed him, the case would have gone against him if Bishop Hendrix had not admirably supported him at the last moment; and the majority of both laymen and preachers carried the day for a commission to ask all the branches of Methodism to unite in this new credal task.

It will do no hurt to look at those Articles. Among the doctrines thus immutable and eternally fixt are the following:

The death of Christ was a sacrifice, "to reconcile His Father to us," and is a sacrifice "for original guilt," as well as "for the actual sins of mankind."

Christ took his human body with him into heaven.

The Holy Ghost proceeds from both the Father and the Son.

Original sin is that "corruption of the nature of every man" which "is engendered of the offspring of Adam."

Since the fall of Adam men have no natural power to do good works pleasing to God without his antecedent grace by Jesus Christ.

The above are questions of either interpretation or philosophy on which there should be perfect freedom of opinion in any Church. If we must have a creed, not one of them should be included.

But there is another objection to the Twenty-five Articles. They are supposed to describe the faith of Methodism; but of the number one-third are attacks on the Roman Catholic Church. Such are the Articles which declare that God does not account us as righteous for our own deservings, but only for the merit of Jesus Christ; that works of supererogation cannot be taught; that "Romish doctrines," such as purgatory, adoration of images and relics, and in-

vocation of saints are "repugnant to the Word of God"; that worship must not be "in a tongue not understood of the people"; that there are only two sacraments and not seven; that transubstantiation is "repugnant to the Word of God"; that the elements are not to be "reserved, carried about, lifted or worshiped"; that the cup must not be denied to lay people; that the sacrifice of masses for the dead "is a blasphemous fable and dangerous deceit"; and that celibacy is not required of the clergy.

Now, whatever we may think of all these things, it ought to be clear that it is none of the business of the Church in stating its own belief to make such statement a polemic against other Christians, no matter how erroneous or heretical their faith.

Further than this, as Bishop Hendrix said, those Articles have no sense of the principal duty of the Church to evangelize the world; nor do they anywhere recognize the fatherhood and love of God. We are not even told that the Father sent his Son as Saviour, but only that the death of Christ was needed to "reconcile" him to the repenting sinner. Certainly these Articles should be put far back on the top shelf, where their dust shall never be disturbed.

#### **Danger to the House of Lords**

Of course Great Britain is far behind France or the United States in its retention of inherited privilege of rule. More than once the threat has been made to mend or end the House of Lords, and they have just offered another provocation to the people. The Laborites had presented to the Lower House a bill to prevent employers in case of a strike to import foreign workmen, and it had passed without a negative, even the Conservatives not venturing to oppose it. Indeed it was a much less drastic bill than the law in force in this country, which forbids the entry of workmen engaged to be employed by any company. But when the bill came to the Lords they rejected it; and the indignation of the Labor representatives was very emphatic and boded no good to the Upper House. People are beginning to conjecture what would happen if the Education bill, sure to pass, should be rejected by the Lords. They may not dare

to do it; and Mr. Birrell is trying to make such moderate changes as will appease the bishops. But in any shape the bill will displease the Lords, as all progressive movements do, and they may be unwise enough to do what they have done in the case of this Labor bill. Then something will happen. Parliament may be dissolved and the Ministry may appeal to the people, when its voice would have to be heard. Once Gladstone threatened to swamp the House of Lords with a flood of Radical peers. It is a very bad system which allows one house, by hereditary privilege, to be absolutely removed from popular control; and ending would be better than mending.

An election to one of the three Senior secret societies at Yale is the most coveted honor that can come to an undergraduate. As the elections are entirely in the hands of the students, it is easy to see that the selected men fairly indicate the student idea of what a college man should be. In reading the biographies of the forty-five fortunate men "tapped" last week in the current issue of the *Yale Alumni Weekly*, we find that twenty-three of them have athletic records. This is a commentary on American college ideals; for the world never has and never will put athletic qualifications above intellectual or moral qualifications as a test of eminence. Still there are some grains of comfort, for the *Weekly* avers that: "A survey of the records of the men will show a larger recognition of the intellectual side of college life than has been noticeable in recent years."

The amendment offered by Senator Lodge to the immigration bill before the Senate, and unanimously adopted, excludes all persons over fifteen years of age who cannot read the English or some other language. One President of the United States would have been excluded if he had come as an immigrant at the age of twenty-one.

It is proved by the special Grand Jury that the three men lynched at Springfield, Mo., for assault were innocent. The woman was not assaulted at all, and the whole story was a hoax. And we are protesting against atrocities in Russia on innocent Jews.

# Insurance

## The Condition of the New York Life

SINCE last December an examination of the New York Life Insurance Company has been going on under the direction of the Fowler Committee. The examination has been in the hands of Price, Waterhouse & Co. and Haskins & Sells. The joint report of these two firms of chartered and certified accountants, made public last week over the signature of Alexander E. Orr, the president of the company, shows the New York Life to be in admirable condition. The published report finds the company's general administration to have been well organized and its management sound. The methods of collecting premiums used by this company are systematic and effective. Economy prevails and the company's books and records are well and accurately kept. The assets of the company at the close of the fiscal year are shown to have been \$438,788,015, or \$2,967,656 greater than the company's own figures claimed. The insurance reserve, as certified by the actuary of the company, amounts to \$379,151,063.70, which exceeds the sum required by the Insurance Department of the State of New York by \$7,201,720. Having made a provision of \$5,589,755 for all other liabilities, the New York Life had, on December 31, 1905, a balance of \$54,047,176.29 available for dividends and for contingencies.

In spite of the criticism that has arisen because of the contribution of \$48,000, made by George W. Perkins, on behalf of the New York Life, to the Republican National Campaign Committee, in spite of the disclosures of the methods of the Chicago meat packers, one effect of which, according to cable dispatches, may lead to a revolt against the New York Life, on the part of British policyholders of that company; in spite of the strictures of Samuel Untermyer arraigning the company and charging its officers with incredible folly and effrontery, and claiming them to be defiant and unrepentant, after the most critical inquiry, it not only appears from the accountants' report, to which previous reference has been made, that this great company is thoroly sound and solvent, but that the statement made to its policy-

holders, on January 1 of the present year, was conservatively made up, and finally that the company's surplus, even though measured by a severer standard of liability, remains larger than the company's report sets forth.

The chartered accountants' report is silent regarding the abuses of the McCall administration, the Andrew Hamilton operations, the "yellow dog fund" and other things for which this company has received criticism.

## Industrial Casualties

Statistics gathered by insurance underwriters go to show that peace, no less than war, hath its fatalities. Lately published figures show that more persons are killed or maimed in Allegheny County, Pa., which is a great iron center, than are numbered among the killed and wounded in some of the great battles of history. The statistics for the past year, for example, show that in the iron and steel mills and blast furnaces there were 9,000 either killed or wounded. In other mills, shops and factories there were 4,000 either killed or maimed. Four hundred persons were killed or wounded in the coal mines, while the railroad list rose to a total of 4,300. The grand total was 17,700 persons either killed or injured. It should not be forgotten also that a large number of casualties are not reported. According to mill owners and managers most of the accidents take place because of the carelessness or recklessness of employees. No one who has ever visited a rolling mill can, however, truthfully deny that workmen therein follow an extra hazardous occupation.

....It is evident that the San Francisco disaster has not entirely killed insurance enterprise, from the fact that the Fidelity Fire Insurance Company, of New York, is now in the process of organization. Those active in the work of organization are for the most part identified, or in close touch, with the Continental Insurance Company. The Fidelity Fire will have a capital of \$1,000,000 and a paid in surplus of the same amount. The new company will be organized under the direction of Henry Evans, president of the Continental Insurance Company.

# Financial

## Railroad Coal Holdings

LARGE financial interests of railway companies are affected by that part of the Railroad Rate bill which forbids the companies, after May 1, 1908, to transport coal which they themselves produce or own. There seems to have been not the slightest foundation in fact for the rumor that the companies' coal interests were to be taken over by a new and great corporation. Several methods of meeting the requirements of the law without getting rid of the coal property are suggested. The companies may sell their coal at the mine to wholesale dealers, and then carry it for the new owners. Or they may shift it to other railway companies and lines before it crosses a State boundary. Transfer of mines to corporations apparently independent would not satisfy the proposed law, which covers even an indirect interest. Some predict that the companies will take no step before 1908, when they will test the constitutionality of the act. The extent of railway coal interests in the East is now quite well known. When the Commission pursues its inquiry at Chicago, many will be surprised to learn how large and important are the coal holdings of railway companies in the Middle West and Southwest.

## The Illinois Central

THE recent report of Stuyvesant Fish, president of the Illinois Central Railroad Company, to his board of directors, has excited much interest, because it is virtually a review of the company's growth since 1887, when he was elected to the presidency, and also because of rumors that the influence of E. H. Harriman will be used to prevent, if possible, Mr. Fish from retaining his office. Mr. Harriman and his associates, it is said, desire to obtain control of the Illinois Central in the interest of their transcontinental system, and are at variance with Mr. Fish on account of his action with respect to the Mutual Life Insurance Company. In this report Mr. Fish compares the progress of his road with that of twelve other railways—three Eastern trunk lines, six having terminals at Chicago, and three Southern lines. In the nineteen years,

the gross receipts of the Illinois Central increased 364 per cent., while the increase for the twelve was 245 per cent. Dividends paid on Illinois Central common stock show an increase of 227 per cent., against 110 per cent. for the others; and the capital increase was 227 per cent., against 104 per cent. Mr. Fish points out that, for every share of added capital, the company has received in money at least its par value; that, in respect to every new issue, each stockholder has had precisely the same right and opportunity to subscribe; and that in no case has the company paid a dollar for having any of its stock underwritten. This proves, he says, that the shares have been held by the general public for investment, and that those owning them have had an abiding faith in the enterprise. It is generally known that Mr. Fish's record as president of this railway system, whose mileage, in nineteen years, has increased from 2,149 to 5,584, is regarded by railway authorities as an exceptionally good one. His management has been characterized by conservatism of the best type, which insured expansion which has been safe while it was broad. The history of it he and his friends may contemplate with great satisfaction.

THE Fulton Trust Company, of New York, formerly Real Estate Trust Company, whose capital, surplus and undivided profits amount to \$1,200,000, has deposits, as shown by the last report, of \$8,025,134.

...Edward P. Metcalf, president of the Old National Bank, in Providence, since 1902, has resigned that office and been elected president of the Atlantic National Bank, in the same city. Several prominent bankers and business men have entered the board of the Atlantic, which will extend its business. The former president, James S. Kenyon, takes the office of vice-president.

## Dividends and coupons:

Am. Chicle Co. (Common), 1 per cent., payable June 20th.

Minn. & St. Louis R. R. Co. (Bonds), coupons, payable June 1st.

U. S. Leather Co. (Preferred), \$1.50 per share, payable July 2d.

Am. Car & Fdry. Co. (Preferred), 1¾ per cent., payable July 2d.

No. 3002

## Survey of the World

### Railways and Coal Companies

Additional testimony concerning the Pennsylvania Railroad Com-

pany's coal interests has been taken by the Interstate Commerce Commission. Joseph B. Boyer, chief clerk of A. W. Gibbs, superintendent of motive power, admitted that in the last three years he had received more than \$50,000 in cash and \$11,000 worth of stock from certain coal companies which he named. Boyer, whose salary was \$225 a month, appears to have controlled the purchase of coal to be used in the locomotives. The companies made him an "allowance" of from 3 to 5 cents a ton. Colonel Jamison and Captain Hicks were among those who gave him shares. He kept for himself all that he received, and in return "did what he could" for the givers. He believed that similar allowances and gifts had been made to his predecessors in office. Mr. Gibbs testified that he had known nothing of the payments to his chief clerk. (On the day after Boyer made these admissions he was dismissed from the service by President Cassatt.) M. K. Reeves, Vice President Pugh's chief clerk, testified that he had received shares having a value of \$47,000, a majority of them from Congressman Huff, of the Keystone Coal Company, a friend of his, whose motives, he said, must have been pure, because he could render no service in return. Huff gave him 600 shares of Keystone, which he sold back to the generous giver for \$30,000. Joseph K. Aikins, chief clerk of the superintendent of the Monongahela division, admitted that in six years, during which his salary had ranged between \$30 and \$126 a month, he had "invested" about \$75,000 in coal stocks now worth about \$100,000. He had also received some shares and cash as gifts. To Boyer he had paid 5 cents a ton for the purchase of coal from a company in

which he was interested. Certain payments of cash to him, he remarked, were "self-explanatory." He did not clearly show how he had obtained the money with which to buy \$75,000 worth of stock. (On the following day President Cassatt discharged him.) Several mine owners testified as to discrimination in the supply of cars. President Potter, of the Donahoe Coal Company, said that the allowance of cars to his mines was reduced until his rating was only one-third of the rating for two companies in which J. G. Cassatt and Congressman Huff were interested, altho the capacity of his mines was three times as great as that of the other two combined. When he complained to Superintendent Creighton, the latter said he owned no coal stock and had no interests to favor. (Creighton recently testified that he had received 1,190 shares, as gifts, from several companies.) "The small shipper," said Potter to the Commission, "will have no show until you give it to him." W. W. Patterson said that discrimination on the Baltimore and Ohio had forced him to sell his mining property in West Virginia for half its value. On the lines of the Reading he had been treated fairly. Charles McFadden, interested in mines at Twin Rocks, said his car allowance was cut down until he was forced to rent cars from a company in which Creighton was interested. Then he was approached by a man who tried to buy him out, telling him he was blacklisted. Chief Engineer Crawford advised him that he must either "buy his way or fight." He fought as long as he could and then rented his property to the company in which Creighton had an interest. The purchasing agent of the Baldwin Locomotive Company said his president had directed him to buy coal of the Keystone (R. K. Cassatt's company) because the Pennsylvania bought Baldwin

monopolies. There was an agreement, it was admitted, requiring the Baltimore and Ohio to make, without charge, repairs (at an annual cost of \$45 to \$55 per car) upon the cars of the Frick Coal and Coke Company, which is part of the Steel Corporation.—When the Commission turned to the New York Central, Vice President Rossiter testified that to this railroad company in 1901 the Beech Creek Coal and Coke Company had given 5,000 shares of its stock, which (owing to a merger) are now represented by 10,000 shares and \$500,000 in bonds of the Pennsylvania Coal and Coke Company. The gift was made in consideration of a contract, in which the Central agreed to furnish cars for 1,000,000 tons a year, to buy 500,000 tons of fuel coal every year, and to interest itself in no other coal company, except the Clearfield Bituminous, which it owns and which supplies coal only to the railroad, and the Gallitzen, which it owns. It was tacitly understood to be the company's policy, he said, that its officers or employees should not hold stock in coal companies. James Kerr, president of the Beech Creek, said he had never heard of a Central officer owning coal shares. He had heard a report that the Central and the Pennsylvania had an agreement that neither should put in a coal mine siding without the other's consent, but knew nothing about it.

#### **Rebates and Combinations**

The testimony of Vice President McCrea showed how the Baltimore and Ohio is controlled by the Pennsylvania, the affairs of the first named road being in the hands of an Executive Committee of six persons, four of whom are Pennsylvania vice presidents, Messrs. McCrea, Green, Rea and Thayer. President Cassatt, he said, after taking office in 1899, decided to discontinue the payment of rebates, and did so in 1900. He was enabled to do this by community of ownership; that is to say, the Pennsylvania bought control of the competing bituminous coal roads. Mr. McCrea thought that the roads would not voluntarily have ceased to pay rebates if a mutuality of interests had not been established by community of ownership. A witness named McLennan, formerly a master mechanic

and foreman, said that when stock was offered to him by Alfred Hicks, he sought the advice of President Frank Thomson, who told him (in a letter which he produced) not to take it, saying that his character and honor were worth more than all the shares he could acquire in that way. This testimony was intended to be set against that of certain officers who had said that their acquisition of coal stock was known (and, inferentially, approved) by President Thomson.—President Cassatt, who returned from Europe on the 3d, has published his answers to a series of questions asked by the recently appointed investigating committee of directors. He says that he owns no stock of any coal company whose coal is shipped on the Pennsylvania's lines. He owned some time ago 160 shares of Millwood stock, but these he sold last year. He owns shares in the Pennsylvania Steel Company, the Cambria Steel Company, the Union Switch and Signal Company, and the Metallic Packing Company, the value of all being about \$300,000. In the Keystone or Henrietta coal companies, or in the firm of Cassatt & Co., he says, he has never had any interest. Some years ago he bought 400 shares (for about \$10,000) of the Berwind-White Coal Company, but sold them eight years before he returned to the Pennsylvania Railroad Company and became president.—It is reported that Mr. Roosevelt has reached the conclusion that the Government ought to retain possession of all the coal and oil lands now in the public domain, and that the Attorney General is making an inquiry as to the President's power to withdraw them from entry. The area of such lands is said to be 40,000,000 acres. It is understood that the President will seek legislation designed to perpetuate the Government's title and to allow the leasing of the lands under restrictions, his purpose being to prevent the acquisition of the mineral or oil deposits by railway companies or monopolistic combinations.

#### **Isthmian Questions**

Chief Engineer Stevens has made an argument before the House Committee against a sea-level canal, saying that the high banks of the narrow cut would be exposed to the violence of the Chagres floods, which at times could not be con-

controlled. Twenty years might be required for the construction of such a canal, in his judgment, but one with locks could be made in seven or eight years. He would like to employ Chinese on the canal route. A complete repeal of the eight-hour law is needed, he says, because the laborers, to whom the law does not apply, will do little or nothing in the absence of the superintendents and foremen, 95 per cent. of whom are Americans, and are therefore bound to be on duty only eight hours.—Dr. Pablo Arosemena, Dr. Morales, General Diaz and Dr. Parras, the Liberal delegates from Panama now in this country, who asked our Government to exert its moral influence for fair play at the approaching elections by sending an inspector or witness to each province, have been told by Secretary Root that such action would infringe upon the independence of the republic. They assert that the Liberal Opposition is clearly and largely a majority, but that, by intimidation, fraud, control of the election boards and manipulation of the voters' lists, the Amador Government has undertaken to deprive the Opposition of its rights at the polls. To avoid a conflict with the armed forces of the Government, they may advise the Liberals to refrain from voting. Dr. Arosemena was chairman of the constitutional convention, and would succeed to the presidency if President Amador should die.—It was reported on the 9th that those revolutionists who invaded Guatemala from the south, under General Toledo, had won a decided victory, and that President Cabrera's Cabinet had resigned. Our Government is interested in the movements of the revolutionists' warship, the tug "Empire," which is said to have carried 180 American filibusters and 3,000 rifles to Guatemala from San Francisco, and to have been flying the American flag while coaling at a Nicaraguan port. The "Marblehead" has sailed north from Panama to make an investigation.

#### The Riots at Cananea

Peace has been restored in the mining city of Cananea by the Mexican troops and mounted police. About forty persons were killed during the riots, six of them being Americans. Owing to the

assertion of the Mexican Government that the disturbance was due to the efforts of a revolutionist junta at St. Louis, inquiry was made in that city, where a group of Mexican Liberals have been publishing a paper called *Regeneration*. Antonio Villareal, secretary of the junta, said that the group had not sought to incite revolution, but had printed "the truth" about the Greene Company's mines, showing that Americans received much higher wages than Mexicans, and pointing out "the evils following the invasion of Mexico by the Yankees." "It was purely a labor fight," he added, "but our great purpose is to overthrow Diaz." It appears that a circular attacking the Mexican Government, to which all the ills of which the miners complained were ascribed, was distributed among the Mexicans. Colonel Greene says the outbreak was due in part to agitation in the interest of our Western Federation of Miners. This the Federation denies. Dispatches say that hundreds of Americans have left Cananea, owing to the attitude of the Mexican authorities.

#### The Chicago Packing-Houses

Immediately after the publication of the Neill-Reynolds report, the Chicago packers gave to the press a signed statement denying the charges made in it, and asserting that they were in favor of rigid inspection. Dispatches of the same date from Chicago said that carpenters and plumbers and white-washers were hard at work in the packing-houses, making improvements of various kinds. The House Committee on Agriculture decided to take testimony. A substitute for the Beveridge bill had been prepared by Chairman Wadsworth and Mr. Lorimer, of Chicago. This was sharply criticised by the friends of the Beveridge bill, who asserted that the substitute omitted many of the essential provisions of that measure and left other parts of it without force. The first witness at the committee hearing, Mr. Wilson, representing the packers, practically repeated the denial which the packers had already made. It was noticed that the Wadsworth substitute was in agreement substantially with his criticism of the Beveridge bill and his

suggestions as to legislation. Dr. Neill, one of the President's investigators, was questioned as to his information and views. Owing to the manner and methods of Chairman Wadsworth and Mr. Lorimer, he complained that there was evidence of bias in the committee, the questions of some members practically assuming that Mr. Reynolds and himself were liars. Mr. Lamb (of the committee) at once said that he agreed with the witness about this. Then two other members expressed similar opinions. Press correspondents' reports say that the bias of Chairman Wadsworth and Mr. Lorimer was plainly shown in their examination of Dr. Neill. The latter produced letters showing that Dr. Dyson, formerly chief Federal inspector at Chicago, but now representing the packers, had suggested to Mr. Reynolds and himself, as they were leaving Chicago at the end of their inquiry, that they should submit no report for thirty days, in order that the packers might have time for making improvements, and that their report at the end of thirty days should be in accord with the improved conditions at that time. Mr. Reynolds also testified. On the 8th, the President, at Mr. Wadsworth's request, sent to the committee the two reports submitted by a committee of inspection appointed by the Department of Agriculture in April. "As to the ground covered in common by the reports of the two investigating committees," said the President, "there is no conflict in substance as to the important matters." To show "the immediate and extraordinary change for the better" which the Neill-Reynolds investigation was "already bringing about," he sent a letter "from a most competent and trustworthy witness in Chicago," in which the making of sanitary improvements at the largest packing-houses with "an almost humorous haste" was described. (It afterward became known that the writer of this letter was Miss Mary McDowell, head of the Chicago University Settlement.) Mr. Roosevelt said that his investigations were not finished. He was not yet prepared "to make a final statement, either as to so much of the complaints as concerns the management of the Bureau of Animal Industry, or as to certain of the graver charges in connec-

tion with the adulteration of meat products." It was unfortunate, he added, that innocent stock growers, ranchmen and farmers must suffer. They could be protected and benefited permanently only by legislation for thoro and adequate inspection. On the 9th, the hearing was closed. At last accounts the committee was intending to make only a few changes in the Beveridge bill. It had refused to hear Mr. Sinclair, who wrote "The Jungle." Representatives of cattle growers' associations want a bill passed that will satisfy the President, and they want it without delay. The Chicago authorities have found many violations of the building laws in the packing-houses. Committees have been appointed by the local Medical Society, the Illinois Manufacturers' Association and other organizations to inquire as to the conditions considered in the Neill-Reynolds report. J. Ogden Armour, now in Paris, says in an interview that the charges of that report are preposterous and are due to "the strong personal animus of Mr. Roosevelt against the Chicago packers."—At Kansas City, on the 12th, the Armour, Swift, Cudahy and Morris companies were found guilty of accepting rebate concessions from the Burlington road on shipments of packing-house products for export.

#### Various Topics

A movement of considerable force for the nomination of Mr. Bryan in 1908 is seen in many States. Missouri, Indiana, Arkansas and South Dakota, at their recent Democratic conventions, adopted platforms supporting this movement, and it has been assisted by the public utterances of prominent Democrats in Illinois and Kentucky. Among those who commend it are Colonel Vilas, of Wisconsin; ex-Governor Francis, of Missouri, and other Democrats who have been counted against Mr. Bryan in the past.—Foster D. Coburn, of Kansas, has declined the office of Senator, to which he was appointed by Governor Hoch. The place has been accepted by ex-Judge A. W. Benson. To succeed the late Senator Gorman, of Maryland, Governor Warfield has appointed ex-Governor William Pinkney White, eighty-two years old, formerly a Senator from

that State.—At the election in Oregon another term was given to Governor Chamberlain, who is called “a Roosevelt Democrat,” but Republicans were elected to all the other offices. The amendment granting suffrage to women was defeated by a large majority. The popular vote for a candidate for the office of United States Senator was in favor of Jonathan Bourne, Jr., Republican, whom the Legislature will elect.—The Senate has passed the Tillman bill, forbidding national banks to contribute money in connection with any election to any political office, and “any corporation whatever to contribute in connection with any election at which Presidential electors or a Representative in Congress is to be voted for, or any election by any State Legislature of a United States Senator.”

#### The Philippine Islands

Some surprise was caused in the Senate last week by the remark of Mr. Hale that the project of making a naval station at Olongapo, in Subig Bay, north of Manila, must be given up because the only trustworthy reports showed that the place was not suitable. Favorable reports have been made by three naval boards, and Admiral Dewey said, two years ago, that this was the best site on the coast for a naval station, navy yard and naval base.—In the House the bill, supported by Secretary Taft, authorizing the Government to lease the coal lands of Batan Island to a private company has been defeated. It was proposed that the company should sell coal for the navy at 10 per cent. above cost. For the navy's supply about \$5 per ton is now paid to sellers in Japan or Australia, and it was estimated that the price of this Batan coal would not exceed \$2.25.—Señorita Luisa Maria Sison, a Filipino student graduating this year at the Drexel Institute, Philadelphia, is at the head of her class in all the subjects which she has studied. She intends to be a teacher in the islands. This is also the intention of Señorita Genoveva Llamas, another student from the Philippines. Señorita Honoria Acosta, who was graduated last year, is now a student in the Women's Medical College, and Señorita Olivia Salamanca, now a

junior in the Institute, will follow her example in the study of medicine.

#### Cuba and Porto Rico

In the Cuban Senate, the commercial treaty with Great Britain has been ratified, by a vote of 11 to 4, with amendments which will probably cause it to be rejected by the British Government. These relate to coaling and coastwise trade privileges for the mercantile marine, and were adopted in order that Cuba's commercial and political relations with the United States might not be injuriously affected. Senator Sanguily complained of pressure from this country, and urged that Cuba should defend herself against the United States and exhibit her independence by insisting upon the treaty in its original form. Senator Zayas (a Liberal) said Cuba was grateful to the United States, which would do nothing to endanger her independence. Senator Bustamente (a Moderate) asserted that Cuba had never received anything but favors from this country, which no Cuban ought to regard with suspicion. Cuba owed her elevation and prosperity to the States, whose attitude toward her inspired complete confidence. It is noticeable that all parties were represented in the vote for the amendments.—At Washington, Mr. Morgan, of Alabama, has been urging the Senate to adopt his resolution for an investigation concerning the Isle of Pines, insisting that the island belongs to this country.—Work on the sugar plantations in Porto Rico has been interrupted by a strike. Complaint is made by the Federation of Labor that the police, in places where work is done under their protection, are used to intimidate strikers. At Arecibo an attempt was made to rescue a striker who had been arrested. In the riot a policeman was wounded and a striker was killed.

#### The Belgian Elections

The recent election in Belgium was of especial interest on account of the unusual alignment of parties. The Liberals, Socialists and Democrats formed an “Alliance of the Liberal Left,” known as the “Cartel,” apparently in imitation of the French *Bloc*, to wrest the Government

from the hands of the Catholic party, which has been in power ever since 1884. The chief charges against the clerical administration were the heavy increase in taxation and the ecclesiastical domination of the public schools. The fusion of the liberal parties was effected in 1901 and by 1904 they had cut down the Catholic majority in the Chamber from 26 to 20. The platform on which they were able to unite had the following provisions: (1) free compulsory and non-sectarian education, (2) personal military service, (3) electoral reform, (4) measures for the benefit of the working classes and against vested privileges. It was shown that over 100,000 children in Belgium receive no State education whatever, and that 80 per cent. leave before completing the elementary course. Since 1886 the number of secular schools has continually decreased, being replaced by Catholic schools subventioned by the State. In regard to military service the liberal fusionists demand a reduced expenditure and wish to do away with the custom of hiring substitutes, by which 20,000 rich young men escape service altogether. King Leopold himself has declared in favor of this reform. The fusionists also wish to abolish the system of plural voting, to which the clerical party owes its continuance in power. Additional votes are now granted to college graduates, property owners and fathers of families. The Socialists want one vote for one man, but they have agreed to the proposition of the Liberals to allow an extra vote to heads of families over thirty-five. The voting age in Belgium is now twenty-five, and it is not proposed to change this. At the recent election half of the Chamber was elected to serve for four years, and the fusion party was confident of being able to overthrow the small Catholic majority. But this they have failed to do, altho they have reduced it from 20 to 12. In the old Chamber there were 93 Catholics, 43 Liberals, 28 Socialists and two Christian Democrats. In the new Chamber there will be 89 Catholics, 46 Liberals, 30 Socialists and 1 Christian Democrat. The gains of the Cartel were among the Walloons; the Flemish provinces remained staunchly Catholic. The members of the Cartel, tho much disappointed in the result, get what consolation they can out

of their gains and hope to win in 1908, when the other half of the Chamber is voted for. But it is difficult to keep a party of such incongruous elements together even while it is in a minority. The orthodox Marxian Socialists are strongly opposed to any alliance with other parties, however temporary, while to the old fashioned Liberals collectivism is almost as distasteful as clericalism.

✽

#### The Duma and the Czar

The Cabinet met the demand of the Duma for the abolition of the death penalty by postponing action for a month, which they legally had a right to do, but which excited great indignation on the

Professor Muromtzeff, President of the Russian Duma and leader of the Constitutional Democrats.

part of the members of the Duma. The Duma declared that the policy of the Cabinet was provocative and obstructive, and that executions henceforth would be considered as acts of murder, not of justice. In spite of this opposition from the elected representatives of the people, the Government continues to condemn and execute prisoners in Warsaw, Riga and St. Petersburg for revolutionary offenses. The wrath of the people is further inflamed by the report that of the eight prisoners recently shot at Riga by order

of the court-martial, six were innocent, and that flogging and torture were used to elicit confessions implicating many others. In the Duma the agrarian question is being debated, and it is evident that the peasants will not be satisfied with anything less than the complete abolition of the private ownership of land. In many parts of the empire the peasants, infuriated by the refusal of the Czar to yield to the demands of the Duma, have attacked the estates and have burned forests and buildings. There are, also, instances of disaffection among the soldiers in several cities, especially at Poltava, where the troops openly mutinied and defied the authorities. The object of the revolutionists now is to spread their doctrines among the troops, so that they will take the side of the Duma instead of that of the Czar, if—or rather, when—it comes to a definite rupture between them.

#### Anarchism in Spain

It is now regarded as certain that Morales, who threw the bomb at the King of Spain on his wedding day, is the same who attempted to assassinate him in the same way just a year before in Paris. The autopsy revealed nothing perceptibly abnormal about the structure of his brain. No accomplices have been found. He was sheltered on the night of the crime by Don José Nakens, a Republican and editor of *El Matin*. Señor Nakens is seventy years old and has been generally respected even by his opponents for his sincerity and honesty. He is very poor, as he sacrificed everything in order to publish his paper. He states that he execrates the crime, but could not in honor refuse hospitality and protection to Morales when he came as a fugitive and pledged him to secrecy before he told him what he had done. Francisco Perez, the director of the Modern School of Barcelona, an institution devoted to the teaching of radical sociological doctrines, has been arrested, together with the instructors, altho there is no proof of their direct complicity. Dowager Queen Christine, who owns the house at 88 Calle Mayor, from which the bomb was thrown, has obtained permission of the Pope to convert it into a chapel in commemoration of the miracle of the escape of the King and Queen. The Cabinet,

of which Señor Moret is Premier and the Duke of Almodovar is Foreign Minister, resigned as a matter of form after the marriage of the King, but has been reconstituted without important changes. No additional legislation against anarchists is regarded as necessary by the Government.

#### The Austrian Political Situation

The Ministry of Prince Conrad Hohenlohe-Schillingsfürst lasted barely a month, and for a time it looked as tho no one else would succeed any better in allaying racial antipathies sufficiently to get together a Cabinet, and in fact the Austrian Parliament met for the first time in its history in the absence of a responsible Ministry. But the leaders of all parties realized the necessity of a strong Government if Austria was to make a successful stand against the rising power of Hungary, and after a long debate the chamber passed almost unanimously a resolution protesting against any modification of the existing status of the common Austro-Hungarian customs tariff. A Coalition Ministry was then formed under the premiership of Baron Max Vladimir von Beck, and composed of officials and of representatives of the German, the Polish and the Czech parties. The new Government will endeavor to carry out the project for the extension of the franchise and come to an agreement with Hungary on the tariff question. The question is a very complicated one from a legal standpoint, but essentially it is a demand on the part of the Magyars for the formal recognition by Austria of the economic independence of Hungary. During the debate in the Austrian Chamber very violent language was used against the Emperor, who was called a weak man and a German at heart, one member going so far as to say that, if it had been constitutional, he would have moved the Chamber to request the Emperor to entrust the management of affairs to younger hands. The Hungarian delegation in Vienna, to listen to the Speech from the Throne on July 10th, was besieged by a mob of Anti-Semites and Clericals, numbering several thousand, which broke the windows and was dispersed with difficulty by the police.

### Servian Regicides Retired

Ever since the assassination of King Alexander and Queen Draga in the palace at Belgrade the British Government has refused to hold diplomatic relations with Servia on the ground that King Peter was to be regarded as responsible for the crime so long as he kept the regicides in high offices. The demand for the dismissal of the regicides so that Servia could resume an honorable position among the nations of the earth has been growing in strength until finally the King has been compelled to accede. The fall of the Grouitch Ministry last month was in part due to this question, altho the failure of the Ministry to satisfy Austria-Hungary on the regulation of the exportation of Servian cattle was another cause. The new Premier, Nicholas Positch, leader of the Moderate Radical party, insisted on the deposition of the regicides from office, and King Peter was forced to issue a ukase retiring the five officers who took active part in the conspiracy and assassination. The retired officers retain their rank as well as full pay. Among them are Colonel Mashin, the brother-in-law of Queen Draga, who gained access to the palace in the night for himself and fellow conspirators, and Lieut.-Colonel Lazarovitch, who stabbed the King and Queen with his own hand, and Colonel Popovitch, who was the most trusted officer of the murdered sovereigns during the two years he was working up the conspiracy. The British Government has accepted the action of the King as an evidence of good faith, and has appointed as Minister to Servia J. B. Whitehead, Chancellor of the Embassy at Berlin.

### China and Korea

The Wai-Wu-Pu, or Chinese Foreign Office, twice returned ambiguous replies to the British demand for assurance that the existing customs arrangement would not be disturbed, but the British Government insisted upon a categorical statement and has finally received it. The Wia-Wu-Pu affirms in its note to the British Legation the customs loan agreements of 1896 and 1898. Sir Robert Hart will not be interfered with, altho he is nominally under the control of the two

Chinese officials recently appointed.—Wu Ting-fang has become discouraged over the rejection of all his proposals for the reformation of the criminal code, and has applied for permission to visit the tombs of his ancestors, which is equivalent in China to resignation from public life. He attempted to abolish torture, flogging and beheading and to introduce the methods he had become familiar with when he studied law in Lincoln's Inn, London, and served as Minister to the United States at Washington. The suggestion of introducing trial by jury was strongly opposed on the ground of the increase in the expense of litigation due to the necessity of bribing a jury in addition to a judge. Dr. Tenney will soon leave Tientsin with forty-five young Chinamen of good family who are coming to America to be educated. They will be distributed among various Eastern colleges.—A revolt of some seriousness, said to have been instigated by the disaffected court faction, broke out at Hong-ju, about seventy-five miles north of Chemulpho, near the coast. The rebels took possession of the town, but the Japanese captured it by exploding a mine under the gate of the castle. One Japanese and sixty-nine of the rebels were killed. Insurrections are reported in five other places. Societies have been formed to counteract foreign influences, the members of which are pledged to kill all persons wearing short hair.—Two divisions of Japanese troops are stationed in Korea to preserve order. In Manchuria the Japanese will maintain 20,000 soldiers, exclusive of the garrison of Port Arthur. This is in the ratio of 15 men for each kilometer of the railroad. The South Manchurian Railroad will issue \$75,000,000 of stock and only Japanese and Chinese will be allowed to own any of it. As China will take only a small part of this, the railroad will practically be in Japanese control. In response to the protests against this action it is announced from Tokio that the Japanese wished to throw the subscription lists open to all nations, but, in pursuance of her unfortunate policy of exclusion, China insisted on it. The German and Austrian military instructors in the province of Shantung are to be replaced by Japanese.

# "I Would Fain Die a Dry Death"

BY CHARLOTTE PERKINS GILMAN

THE American public is patient,  
The American public is slow,  
The American public will stand as much  
As any public I know.  
We submit to be killed by our railroads,  
We submit to be fooled by our press,  
We can stand as much Government scandal  
As any folks going, I guess.  
We can bear bad air in the subway,  
We can bear quick death in the street,  
But we are a little particular  
About the food we eat.

It is not so much that it kills us—  
We are used to being killed;  
But we like to know what fills us  
When we pay for being filled.  
When we pay the Beef Trust prices—  
As we must, or go without—  
It is not that we grudge the money,  
But we grudge the horrid doubt.  
Is it ham or trichinosis?  
Can a label command belief?  
Is it pork we have purchased, or poison?  
Is it tuberculosis or beef?

There is really a choice of diseases  
To any one, little or big;  
And no man really pleases  
To die of a long-dead pig.  
We take our risks as we're able,  
On elevator and train,  
But to sit in peace at the table  
And be seized with sudden pain  
When we are at home and happy,  
Is really against the grain.

And besides—admitting the poison—  
Admitting we all must die—  
Accepting the second-hand sickness  
From a cholera-smitten sty;  
Patiently bearing the murder,  
Amiable, meek, inert—  
We do rise up and remonstrate  
Against the Packingtown dirt!  
Let there be death in the dinner,  
Subtle and unforeseen,  
But O, Mr. Packer, in packing our death,  
Won't you please to pack it clean!

NEW YORK CITY.

## A Home Colony

BY UPTON SINCLAIR

[To the general public "The Jungle" is a lucky accident, like the sudden and inexplicable popularity of any novel that happens to create a sensation. But readers of THE INDEPENDENT understand the motives and purpose which has inspired the author in his struggle against adverse circumstance. More than three years ago he flung his challenge to the world in proud and bitter words, and made his boast that he would force the public to listen to him. To many readers the article seemed the empty mouthings of a foolish boy, soured because the world would not take him at his own valuation. THE INDEPENDENT was criticised for giving space to such idle boasts. It was said we were deceived by the pretensions of a charlatan. But now that Upton Sinclair has "made good," and has gained a hearing and exerted an in-

fluence in this country and abroad greater than almost any other modern novelist, his own frank statement of his ambitions becomes of especial interest.

The signed articles that have appeared from his pen in our columns are:

"A Review of Reviews," February 6th, 1902; "On the Teaching of Language," February 27th, 1902; "Language Study—Some Facts," June 19th, 1902; "Cunylums," July 31st, 1902; "The Confessions of a Young Author," November 2d, 1902; "My Cause," May 14th, 1903, and "Is 'The Jungle' True?" May 17th, 1906.

We republish the following extracts from his article entitled "My Cause":

"I, Upton Sinclair, would-be singer and peniless rat, having for seven years waged day and night with society a life-and-death struggle for the existence of my soul; and having now definitely and irrevocably consummated a victory—having routed my last foe and shat-

lived my last hour and made myself master of my own life; being in body very weak and in mind very weary, but in will yet infinitely determined, have sat myself down to compose this letter to the world, before taking my departure for a long sojourn in the blessed regions of my own spirit.

"I should not write a letter to the world for the purpose of setting myself right; being 'lord of a thousand dollars,' the world no longer exists for me. What people think of me is not whispered in the forests that I love, and I have read my last review, and waited upon my last publisher, and cringed before my last rejection. The sole reason for my writing is that in that world there are surely others, born to sing and to worship, as I was born to sing and to worship, but born less capable than I in the world's low way—less willing to fight the world with its own weapons—less cunning, less unprincipled, than I. For such there being in the place from which I have escaped no salvation, and no prospect, save to be stewed and mashed in misery for a lifetime, as I for seven long years, I could not greet my muse until I had flung my banner wide and declared myself to men.

"*My Cause!* You laugh at me, no doubt, but some day you will heed me; and meanwhile here and there may be one who will recognize this letter for what it is—the coming into the world of a new ideal. Nothing ever happens in this world that is of the remotest consequence except the coming into it of a new ideal.

"I knew that the hoax [the publication of 'The Journal of Arthur Sterling'] would cost me my reputation and the respect of all decent people; but that did not matter, for I have not been favored with the acquaintance of many decent people, and am obliged to hear what the world thinks of me. Besides, I would cheerfully have robbed a bank, or sandbagged a millionaire, had my task been possible in no other way. My one desire was to raise a sensation, first to sell the book, of course, and, second, to give me a standing ground from which to begin the agitation of *My Cause*.

"*My Cause* is the cause of a man who has never yet been defeated, and whose whole being is one all-devouring, God-given, holy purpose. And this Cause he will fight for while there is breath in his body and power in his soul; and if he cannot make the cultured and the wealthy support it, he will do it with the earnings of all his own life; and if they do not suffice, he will raise up sons and daughters of his own to go on with the task. It matters not to him if not one single man who reads this paper believes that he is right; this is his Revelation, and it is for the world to recognize it.

"You do not understand, for you have not the memory of the midnight hour when I knelt with a fire of anguish in my soul, and hot tears upon my cheeks, and registered my vow: So help me, Almighty God and His angels, if I come out of this torture-house alive, never will I rest in this world again until I have saved the man who comes after me! Until I

have made it impossible for a human soul to suffer the shame that I have suffered in this life! Until I have made it impossible for joy and tenderness and rapture and awe to be lashed and spit upon and trampled and mashed into annihilation as mine have been! Until I have made this world a place in which a young artist can live!

"I have talked about myself in this discourse, and I have told all my private affairs; you will show yourself but a poor fool if you think I have done it because I like to talk about myself, or because I like to have you talk about me. I have done it grimly, and with clear foresight. I design this article to sear itself into the hearts of men, good and evil. What I write may not please you, but at least it stirs you, and you will not soon forget it. And you may sneer at it now, but you will live to blush for the sneer, and then you will be in the mood that I wish, and will understand what I mean when I say that there is at present no means of existence provided in this world for a man who would seek the heights. I am such a man, single-hearted, consecrated, and uncompromising; and I have been for years in this most enlightened society a tramp, and an outcast, and a wretch. And now I boast of a 'victory'—after endless waiting, a 'victory'; and that means that I have the price of a board shanty and of three years of bread and meat, and am free for that length of time to work sixteen hours a day."

As another part of the "*Cause*" to which he is devoting his life, Mr. Sinclair contributes the following plan for co-operation in the domestic industries. —EDITOR.]

I HAVE a problem to solve. I write an article about it for the reason that there are others troubled with it, and I believe that a number of people might solve it together where each would fail by himself.

In carrying out my purpose I am obliged to discuss what the world would call my "private affairs." So I explain at the outset that I am a Socialist, and consider that the private affairs of most individuals constitute the most important public affair now existing. I discuss my own because they are typical, and because they happen to be the ones with which I am most familiar.

The problem is the one commonly known as the "servant problem." I invite you to consider the situation of a man who is possessed of a small family and a small income, and wishes to be free to turn his attention to intellectual pursuits.

A few years ago the solution would

have been a simple one. Then all my wife and I ever dreamed of wanting was a one-room cabin in the country, solid enough to keep out the rain and the cold; and we should have eaten but one hot meal a day (and forgotten to eat that most of the time) and been blissfully happy. But now, for numberless reasons, this is impossible. We are no longer as strong as we were; we are no longer able to perform the office of cook and housekeeper with serenity. Also we have learned more about the world in which we live; we have been to Packingtown, which means that we can never again eat meat without a qualm; and in the same way we tremble at store bread and butter and milk, at canned vegetables and fruits—at nearly everything, in fact, that we ate when we dwelt in tents and shanties, and wrestled with indigestion. And then finally, of course, there is a little boy, who cannot be fitted into any such scheme.

For the past two years we have lived upon a farm; and a farm is the ideal place to bring up a child, you have read in the books. At the outset a hunger for companionship seized our David, and he found his way to a neighbor's and played with a little girl who stuttered. After a week or two we found that he was stuttering, too, and stopped the visits, but too late; and now, for all I know, he may continue to say every word three times over as long as he lives. And when he was not learning to stutter he was up in the pear orchard, stuffing himself; or behind the house, swimming the baby ducks and his shoes in the wash-tub; or out in the kitchen, mixing himself a pudding of pepper cruets, candlesticks and milk. So it was found necessary to get some one to take care of him; so, little by little, the *problem* has arisen. For you must understand that it is not merely a question of finding a governess or kindergarten expert; it is a question of setting up and keeping under way a home for him—it is a question of an establishment, of servants!

I could take a whole article to tell what images the dread word "servants" evokes in my mind. The servants I encountered when I lived in my mother's home! The one who cut out the bottom of our fruit cake and left us only the hol-

low shell for Christmas! The one who took the Thanksgiving turkey home to her friends, and told us it fell out of the window! The one who went crazy—the one who got drunk and threw the salt box at my mother! And then our own, at the farm, all in a single year; the Irish lady who ate so much that she could hardly walk; the Hungarian girl who ate raw sausage, and wept and told us of her love affair; the angry looking personage who hid the eggs to save the trouble of cooking some for breakfast!

The mistake was in the beginning—you say—if you object to servants you ought never to have married. But is a man to be denied the privilege of parenthood just because he happens to possess an intellect? And is it for the best interests of the race that its future generations should be furnished exclusively by the ignorant and callous? And if authors, artists, scientists and philosophers are to reproduce their kind, what is to be done? Shall they have to marry their housekeepers? I have made many sacrifices for my art, but I confess that that one would have staggered me.

You see, the trouble is that we are Socialists, and do not believe in master and servanthood; it seems wicked to us, and we go about the world and see it, and our hearts bleed for the misery of it. And of course we cannot help pitying our own servants, even when they impose upon us; and we encounter their personalities, vulgar and egotistical, and we shrink from them—we cannot get up the courage to face them, but sit in the parlor and hold terrified consultations. "The potatoes are simply impossible," say I; "Mary *must* be told." "But she will be offended again," says my wife; "you tell her!"

Of course we can do it if we must. We can stick to the farm and raise all our own food, and keep our health, and do it all at moderate expense—but how pitiful it is! We cannot travel, we can never hear any music, or attend the theater; we can have only books and our own thoughts, winter and summer, year in and year out. We cannot send our child to a kindergarten, to school; he can never be with other children. Can a mere writer of original books afford a house in the city, or city prices for im-

just hell? And of course we cannot keep a wide-awake boy in a boarding house or an apartment. I have had him two weeks in a New York flat and seen him turn four able bodied adults into fit subjects for sanitarium treatment. And are we to go to hotels in the summer time and take our chances of typhoid and malaria, and pay huge sums of money to live in the same house with people less congenial than our own servants? No, we must have our own home, and in the country; so our thoughts come back from every flight. Let us make one desperate effort to try to get good servants, and then pay them anything and keep them; and when we get the machine running let us get a little house near by and keep it for our own and allow no one there, and go and live there and eat cold food and do our own work whenever we wish to be alone with our thoughts.

That was our plan, until I took the resolution to write this article. There are hundreds, and even thousands, in exactly the same plight, I said—and why should they all sink back and reconcile themselves to the monstrous absurdities of isolated housekeeping? Surely it cannot be that there are not a few men and women in this country with intelligence and initiative enough to come and find a rational and scientific way to live!

As a preliminary to explaining what I wish to propose, I shall state one thing that I do *not* propose. I am not dreaming any sort of self supporting colony, to set a new ideal and realize the Co-operative Commonwealth. I am a member of the Socialist party, and all the hopes of my life are there. I understand that the hope of humanity is not in any new machinery or process to be discovered or created, but in the opportunities already existing, and now owned and operated for purposes of exploitation; I understand that so long as the mines and the factories, the railroads and the governments of the world are held and run by capitalists, any colony of laborers, however wise its organization and however noble its ideals, must be a colony of wage slaves. What I am making here is a simple business profession, for an association of people who may possess a moderate income, to secure the benefits

of the application of the machine process to their domestic affairs.

Here am I on my little farm, living as my ancestors lived—like a cave man or a feudal baron. I have my little castle and my retainers and dependents to attend me, and we practice a hundred different trades: The trade of serving meals, and the trade of cleaning dishes, the trade of washing and ironing clothes, of killing and dressing meat, of churning butter, of baking bread, of grinding meal, of raising chickens, of cutting wood, of preserving fruit, of heating a house, of decorating rooms, of training children, and of writing books! And all these crowded into one establishment, in close proximity, and all jarring and clashing with each other! And all carried on in the most primitive and barbarous fashion, upon a small scale, and by unskilled hand labor. It takes a hundred cooks to prepare a hundred meals badly, while twenty cooks could prepare one meal for a hundred families, and do it perfectly. It costs a hundred thousand dollars to build and equip a hundred kitchens; it would cost only five thousand dollars to build one kitchen! But, of course, if you have large scale cooking at present, you can only have it under capitalist auspices; and so it is associated in your minds with uncleanness, and bad service, and high prices. It takes a hundred churns and a hundred aching backs to make a thousand pounds of butter; it would take only one machine and a man to tend it to make the same thousand pounds, and the cost of making it would be cut 95 per cent. But of course you cannot have large butter making except it is done for profit—and that means adulteration and poisoning! It takes a hundred ignorant nursemaids to take care of the children of a hundred families, and develop every kind of ugliness and badness in them; it would take only twenty or thirty trained nurses and kindergarten teachers to take care of them co-operatively, and bring them up according to the teachings of science.

One could show this same thing in a thousand different forms, if it were necessary; but it has all been reasoned out in Charlotte Perkins Gilman's book, "The Home," and any one to whom the idea is new may read it there. The purpose

of this paper is not to persuade any one, but to move to action those already persuaded. There must be, in and near New York, thousands of men and women of liberal sympathies, who understand this situation clearly, and are handicapped by its miseries in their own lives—authors, artists and musicians, editors and teachers and professional men, who abhor boarding houses and apartment hotels and yet shrink from managing servants, who have lonely and peevish children like my own, and are no fonder of eating poisons or of wasting their time and strength than I am. There must be a few who, like myself, have realized that it is a question of dragging thru life a constantly increasing burden of care, or making an intelligent effort and solving the problem once for all. To such I offer my co-operation. I am not a business man, but circumstances have forced me to take up this problem, and I am not accustomed to failing in what I undertake. I have said that "Socialism is not an experiment in government, but an act of will"; and I say the same of this plan. Having gotten the figures from experts and found out exactly what we can do, the one thing remaining is to go ahead and do it.

I suppose that the average professional man invests ten thousand dollars in a home (or else pays rent equal to interest upon that sum); and that he pays two thousand dollars a year living expenses for his family. Let a hundred such families combine to found a co-operative home, and there would be a million dollars for building and equipment, and two hundred thousand dollars a year for running expenses; I believe that for half the outlay five hundred people could live and enjoy comforts at present possible only to millionaires. I have, however, no intention of asking any one to risk his money upon such a guess. I write this to find out if there are people disposed to consider the project; and if there are enough, I will have the plan figured upon by architects, contractors, stewards and other qualified experts, and have prepared a definite business proposition, and a plan of organization for a stock company.

The following embodies my own conception of what such a "home colony"

should be. It would be located within an hour of New York, and would have one hundred families, and three or four hundred acres of land, healthfully located, near some body of water, and as unspoiled by the hand of man as possible. It should have an abundant water supply and a filtering plant; an electric light and power plant, and a large garden and farm, raising its own stock, meat, poultry, fruit and vegetables, and canning the last for winter use. It should be administered by a board of directors, democratically elected. For the management of its various departments salaried experts should be employed; machinery should be installed wherever it could be made to pay, and the best modern methods should be applied in every industry. All its purchases should be in bulk and tested for quality; and, so far as the preparation and serving of food is concerned, the processes should be kept as aseptic as a surgical operation.

We are accustomed to having our buildings for public purposes endowed by persons with a great deal of money and few ideals; and so we consume much space and material and accomplish little, exactly typifying our civilization. The buildings of this home colony should be of frame at the outset, of simple and expressive design, each structure exactly adapted to its specific purpose. The buildings should be conveniently grouped—those for the children in one place, those for cooking and eating in another, those for reading, for music and social intercourse, for recreation and exercise, in still other places. The greater part of the land would of course be given up to farm and woodland, and to the individual dwellings of the families. The ground available for this latter purpose should be divided into lots, priced according to size and location, and leased to stockholders for long terms. Each would erect his own home, according to his own taste—a home, of course, of a kind hitherto unknown, with no provision for the cooking of food, or the training of children, or other trades and professions. It would be a place where the family met, to rest and play and sleep. It might be large or small, anything that the owner chose to make it—my own would be a four or five room cottage, of rustic de-

there, and it would cost from six to eight hundred dollars. Besides these there should be apartment buildings, owned by the colony, and dormitories with rooms for single men and women.

As to the public buildings, there should be a large and beautiful dining hall, and a modern, scientifically constructed kitchen. There should be separate tables for each family, or for congenial groups of people. The service should be unexceptionable, the food simple, but perfect in quality and preparation; there should be a vegetarian service for those who prefer this cheaper mode of life, and the charge for board should be based upon the cost of the service. As to what the cost would be, with a colony raising nearly all its own food upon the premises, I can only submit three experiences of my own: First, it cost me for my family of three to board in New York city, in one room and in the cheapest way, a thousand dollars a year. Second, it cost us, living in a three-room cottage in the country, doing our own work and buying our food from a farmer at wholesale prices, seven hundred dollars a year. Third, it cost us, living upon a sixty-acre farm, which represented a total investment of four thousand dollars, doing no work ourselves but the managing, paying a man and woman five hundred and forty dollars a year, having a horse and carriage, and feeding five persons instead of three, a total of less than six hundred dollars a year. Lest this statement should be unbelievable, I put it in another form—the total expenses of the farm, including labor, were less than twelve hundred dollars, the income was six hundred dollars, and the net loss, or the cost to us of a year's living, was less than six hundred. And these figures, it should be explained, included not merely board, but also household supplies and repairs of all sorts, items which would appear in other places in the community's accounts. I will probably be laughed at, but I believe that, granting the land, horses and machinery, buildings, equipment and capital, the members of such a colony as I describe could be provided with perfect service and an abundance of food of the best quality at a total cost of one hundred dollars a year per person.

So much for the co-operative prepara-

tion of food. And now for the caring for children. There should be two separate establishments, one for infants, who like to sleep, and one for children, who like to run and shout. Both should be scientifically constructed and ventilated and kept as clean as an up-to-date hospital; the food should be prepared under the general direction of a physician. No building for children should be over two stories high, and the upper windows should be beyond the reach of children; no matches or exposed fire should be permitted, and there should be a night watchman, fire extinguishers and an automatic sprinkling apparatus. These establishments should be under the supervision of a board of women directors; and the actual work of caring for the children, washing, dressing and feeding them, playing with them and teaching them, should be done by trained nurses and kindergarten teachers who live in the colony as the friends and social equal of its members. In other words, it is my idea that the caring for children should be recognized as a profession, and that servants should have nothing to do with it; it is my idea that it should be done in a place built for the purpose, with floors for babies to crawl where there is no dirt for them to eat, with playgrounds for children where there are no stoves and no boiling water, no staircases and wells, no cats and dogs, no workbaskets, lamps, pianos, sewing machines, jam closets, inkstands, and authors' writing tables. Instead, there should be sleeping rooms and bedrooms, and sun parlors for nursing mothers; a separate building for the sick; kindergarten rooms and indoor playgrounds for bad weather, and a big all outdoors romping ground, with sunny places and shady places, swings, rocking horses, sand piles, and all other accessories of a children's heaven. Of course, any mother should come and play with or care for her own children just as much as she pleased, or take them home, as she chose; tho I think that no one would care to assist this plan who did not believe that children should be cared for in accordance with the principles of science, and preserved from the corrupting influence of grandmothers and aunts. Of course, any mother who believed that her work in the world was

caring for children, and who wished to care for her own and others, according to the methods of the commonwealth, would be free to do so, and to earn her living by doing it.

I have already explained that I should not regard this as an experiment in Socialism; but I do think that those who undertook it would have to be in sympathy with the spirit of Socialism, which is the spirit of brotherhood and democracy. Whenever I have mentioned this plan to friends they have always said: "The great difficulty would be to get together a community of congenial people." It does not seem to me that this would be a difficulty at all. Every member of the community would have his own home, to which he would invite his personal friends as he chose; and the other members of the community he would meet in the same way that he meets acquaintances in business and politics, in theatres, restaurants and clubs. I myself am the most unsociable of human beings when I am busy, and have no idea of giving up my hermit's tastes. In a colony of a hundred families there ought to be persons of every kind of inclination, and it would not be in the least necessary for any one to associate with those who were not congenial. Of course there are people in the world whom we should not want near us at all; but such people, I think, would not care to join our colony. Vulgar and snobbish people get along very well in the world as it is, and do not find it a task to give orders to servants. Those who would be interested in such a plan would be men and women who wished to practice "plain living and high thinking"; and they would naturally wish to get as far as possible from every suggestion of ostentation and conventionality. They would establish the shirt waist and the short skirt as *en regle*, and would, I trust, allow me in without a dress suit. They would be all hard working people themselves, and they would not look down upon honest labor. This spirit, if wisely and earnestly cultivated, would solve the "servant problem" for the colony, and solve the health problem for its members as well. I know business and professional men who, when they need exercise, have to go down into the basement

and lift weights and pull at rubber straps; and they envy me my farm, where I can hoe the garden, or pitch hay, or pick fruit, and not merely benefit my body, but also put money in my purse. In this community every member would be credited for the time he worked; and it ought to become the custom for the men to help with the harvests, and the women with the preserving of fruit, and the children with the berry picking and the weeding of the gardens. I have no doubt that there are thousands of young men and women in New York city, students of art and music and the professions, who would be glad of a chance to earn their way in a community where class feeling did not make labor degrading. I appreciate the difficulties in the way of such a project; the chances at present against a coal heaver being a socially possible person, and I am not insisting that the day laborers should share in the privileges of the community. But I do think that this should certainly be the case with those whom we select to care for and teach our children, and also, if possible, with those whom we permit to prepare and serve our food; if I am not willing to shake a man's hand or sit next to him in a reading room, I do not see why I should be willing to eat what he has cooked. I personally know a young man who is studying art, and who earns his living by washing dishes in a downtown restaurant, because it takes only two or three hours a day of his time. In Memorial Hall at Harvard University, in the sanitarium at Battle Creek, and in many other places I might name, those who wait upon the tables are college students; and any one who knows the difference which there is in the atmosphere of such a dining hall knows what I should wish to attain.

I have so far only outlined the two main industries of the colony, the caring for children and the preparing for food; the nature of the other common opportunities would suggest themselves to any one. There would be a laundry, a boat livery and bath houses, a drug store, a general store, a refreshment room. There would, of course, be a complete telephone service, electric lights and hot water or electric heating thruout the buildings. There would be a resident

prediction, and perhaps before long teachers of music and languages might find it worth while to join the colony. There would, of course, be a building for social purposes, with large piazzas for summer and sun parlors for winter; there would be a hall for lectures, concerts, theatricals and dancing; there would be a reading room and a circulating library of periodicals and recent books. It is your custom to spend say fifty or hundred dollars a year for these, and you could achieve your purpose co-operatively for a fifth of the expense. There would be a gymnasium and a swimming pool, and of course tennis and croquet and baseball grounds. There would be stages to meet all trains, and closed conveyances to convey people to and from the dining hall in bad weather. There would be a livery stable, at which you could hire or keep a rig for about one-fourth what it would cost you elsewhere.

I think that such a community should be planned for the accommodation of a certain number of members, and the necessary working force, and should be limited to these. Not all of the members need be stockholders of course; others might be admitted to the benefits of the association, but in that case the stock should pay dividends, and in any case the management of the corporation would have to be vested exclusively in the stockholders. For the administration

of the various industries there would have to be a superintendent, a man of first class executive ability, responsible to the board of directors; and there would be a corps of managers of departments, each a thoroly experienced man; a manager of the farm and stables, of the truck and flower gardens; of the purchasing department and the co-operative store; of the catering department, of the buildings and grounds, the power plant and the heating department. How many such men there should be and what they should be paid, how many employees of all sorts would be necessary, is one of the questions upon which expert advice is needed. As I said before, I am willing to get a complete set of figures for the enterprise I have outlined, provided that I hear from a sufficient number of people to make it worth while. I am perfectly and seriously in earnest about the matter, willing to give my time to it, for years, if need be. I hope to hear from one or two hundred people who are interested; but I am willing to undertake the enterprise with as few as twenty families. I wish to hear not merely from those who will invest as stockholders, but also from those who will rent or build homes; from men and women who are willing to contribute their labor, as waiters, cooks, nurses, teachers or managers; and from persons having business experience who would like to help me in working out this plan.

PRINCETON, N. J.

## The Railroad Rate Debate in the Senate

BY ISIDOR RAYNER

[The Hon. Isidor Rayner, United States Senator from Maryland, as is well known, took a leading part in the Railroad Rate debates in the Senate. His speech on the Monroe Doctrine at the beginning of the session will also be recalled. Senator Rayner was chief counsel for Admiral Schley in the famous trial before the Court of Enquiry. His wide experience in the trial courts and appellate tribunals renders his opinions in the following article especially interesting.—EDITOR.]

IT may be asserted as a rather safe proposition that the people of the country are weary of listening to or reading any further prolongation of the Railroad Rate question that has occupied the Senate during the last few months.

I have, however, been asked to summarize some leading features connected therewith, and also the results that have been reached, which I shall proceed to do as concisely as possible.

The debate was perhaps as interesting

and instructive as any that has taken place in Congress for years, and this was the more remarkable because the subject under discussion in its manifold details was not one that presented many attractive features to the public in general. It occupied a vast field of legal questions and of public policy and of expert knowledge in regard to railroad manage-

bore the brunt of the battle deserve the greatest credit for the untiring patience and exhaustive labor that they devoted to its investigation. It was necessary for those who desired to familiarize themselves with the work in hand to read and analyze over five thousand pages of testimony, besides innumerable communications and suggestions that

Isidor Rayner.

ment that would not seem to form subjects for public interest, and nevertheless it is a fact that not only was there a crowded attendance upon many days of the discussion, but that the public and the press followed it thruout all of its progress, in all of its minutest details, and it seemed to gather instead of losing in interest as it proceeded to its conclusion.

It was a voluminous subject to handle, and the leaders and the committees that

were submitted to Congress after the evidence had been concluded. It was the culmination of a great struggle that had been proceeding for over fifteen years thruout the country, and which brought us face to face with one of the most important economic problems that has perhaps ever engaged our attention.

In accordance with the request that has been made of me, I can epitomize some leading features of this debate by saying:

In the first place, the debate was non-partisan and non-political, which is a rare occurrence in any public controversy upon the floor of Congress. It would be difficult to recall any episode that called forth any exposition of party bias, or which involved a separation upon party lines upon any questions that were involved. Both parties were at work earnestly and honestly to secure for the country a measure that would meet the exigencies of the case and bring about a result that, so far as possible, would gratify public expectations, and remedy the evils under which the people were suffering.

It is therefore a remarkable event, worthy of record, that during the whole of this protracted debate hardly an utterance can be found that had reference to any political division by the forces that were arrayed against each other in the most acute stages of the discussion. One looks in vain for any other debate in Congress, upon any other question as great as this, that exhibits this peculiar feature, and it is safe, therefore, now to assert that neither party will have a legitimate right or privilege of claiming that this enactment is a victory of one party over another. Any one could have listened thruout, to almost any of the arguments that were made, without being able to detect to which party the speaker belonged. This is a notable triumph, and attests unmistakably that when the representatives of the American people are assembled to perform a great public duty they can, without regard to party politics, unite in a patriotic effort for the best interests of our common country.

The next feature that it may be permissible to refer to is the undoing of the public criticism that at the beginning of the debate had been leveled against the Senate. There were ominous predictions at the start that the Senate would either not pass any legislation at all, or if it did enact a law it would be so favorable to the corporate interests of the country that it would result in frustrating instead of effectuating the object in view. It soon became apparent that the Senate had no such purpose, and public censure was quickly turned into public approval of the course that was being pursued.

The next prominent feature that came to the surface in the argument was the research and the study that were required to fully understand the subjects that were involved. Complicated questions of public policy with regard to the management of railroads and questions of constitutional and statutory law came to the front almost daily, and they received the attention of every one who participated in the discussion, to the almost absolute exclusion of every other subject of legislative action.

At first it was suggested that the constitutional lawyer was too much in evidence, but this criticism vanished as soon as it became evident that supreme questions of our organic law were involved that could not be overlooked without doing a lasting injury to the subject. An attack had been made at the outset, perfectly justifiable and influenced by the best and highest convictions, by Senator Foraker, of Ohio, that the whole framework of the law that we were constructing was beyond the reach of legislation, and that it was not authorized by the Constitution, and this charge had to be met with the resistance called for by the high authority from which it sprang. This gave rise to a most interesting argument as to the power of the general government, and it can fairly be stated that the constitutional provision to regulate commerce among the States never received such a comprehensive exposition upon the floor of Congress as it did in this debate.

Now, as to the results that have been reached. While this enactment might not be entirely satisfactory to the people, it nevertheless marks a period in our national development, of progress, and is an important advance upon all previous legislation. A great many amendments were offered to the bill that ought to have been passed, and some were passed that perhaps ought not to have been adopted, but, taking it as a whole, the new law is full of beneficent provisions which, while not revolutionary in character, will tend to keep the railroads of the country within proper bounds, and afford untold relief to every public and private interest that come in contact with them.

The act will, of course, go into the courts for judicial construction, and among the main questions that will be

presented for consideration will be the following:

1. Has Congress the right to regulate the railroad rates of the country?

2. Assuming that it has the right, has it the power to authorize the Interstate Commerce Commission to fix the rates in accordance with the standard that it has declared?

3. Shall the courts retry the cases, or shall the orders of the Commission be final unless they invade and violate constitutional rights?

My own judgment is that the courts will hold that Congress has the right to fix the standard and the further right to authorize the Interstate Commerce Commission, as an administrative body, to determine and prescribe the rates in accordance with the standard fixed by it.

In regard to the last point, as to the power of the courts, I look upon this amendment of an unlimited review as an absolute defect in the law, and I am firmly of the opinion that under this provision the courts will try the cases *de novo* and that the judgment of the Commission will only be advisory.

The act would have been as close to perfection almost as it is possible to bring legislation if this broad review, as it has been called, had been limited to the constitutional inquiry as to whether the property of the carrier was taken without just compensation. The action of the President in connection with this amendment, to say the least of it, disconcerted his personal friends upon the Democratic side of the Senate, who sincerely believed in confining the court to an inquiry under the Constitution, and not investing it with the unlimited function of trying the issue in all its details. The President either believed that the new review now incorporated in the act

by the Senate was no enlargement of the previous review that he had accepted; and if he believes this he is mistaken upon the law of the case; or he believes that this new review is broader than the constitutional review, and if he believes this then he changed his position without consulting those that were acting with him.

No one attributes to the President anything but honest motives and a zealous purpose to promote this legislation in the interest of the American people, but this change of his position greatly embarrassed his friends at a most critical period of the controversy. As it is, the President deserves great credit, and he has received acknowledgment thereof from the Democratic side for inspiring to a large extent, and encouraging and insisting upon this legislation, and without his persistent purpose it is very doubtful whether we would have any new enactment at all.

One thing is sure; that under the bill as it now stands the carriers will be absolutely protected; they will always have "due process of law" and "just compensation" under the Constitution, and my judgment is they will have besides this a reviewing court of original jurisdiction to protect them at every juncture and at every point of the controversy between themselves and the shipper.

It is honestly hoped, therefore, that the rights of the shipper and of the commercial interests of the country and the consumer and the people may be equally well guarded in an equivalent degree with that of the carrier, and at every stage of the controversy they may be protected equally with the railroads, and may receive justice "freely, without denial," and "speedily, without delay."

WASHINGTON, D. C.

# The Opening of the Duma

BY ALBERT EDWARDS

[One of our correspondents in Russia using the pen name of Albert Edwards, was fortunate enough to gain entrance to the Throne Room of the Winter Palace for the opening of the Duma, which he graphically describes in the following article. We are glad to be able to present with it a photograph of this historic scene.—EDITOR.]

“**A**LLONS Messieurs, montez, s'il vous plait.”

A dapper little man in brilliant uniform and many decorations gave us this glad word. For an hour and a half we had been waiting, standing by a door to the Winter Palace. Carriage after carriage had whirled past us and been emptied of its load of gorgeous officers and grand dames. Orderlies galloped about and all the crack regiments of Russia were ranked in the square in front of the Palace—“Guards,” “Lancers,” “Hussars.” We had been standing there since a little after eleven, in evening dress, and looking like unemployed waiters. But we had become used to waiting. Getting admittance to this function, the formal opening of Russia's new Parliament, was the most trying and nerve racking feat ever asked of a newspaper correspondent. There were men in our group who had followed our army in Cuba, who had covered the Boer War and had campaigned in Manchuria, but all agreed that this was the most vexing of their experiences.

First we had applied to our Ambassadors, and were then summoned to the Marie Palace to meet some court official, wasted a half day there and were told to come again the next day. Then we had to furnish photographs endorsed by our Embassies. We were sent to the Chancellery of the Court, and back to the Marie Palace—endlessly. All this time, apparently wasted, was well used, I found afterward, by the police. This coming and going was simply to give them a chance to become well acquainted with us, to trace our steps and to assure themselves that we were not bomb throwers.

After we had stood 'round an hour and a half the little man gave us the call in French and we were let in. Our passes, elaborate affairs, were scrutinized, and

we were filed past a line of gendarmes who had memorized our faces. We were led up to a large “*salle d'attente*” and again we had to wait.

The door was at last thrown open and we were told to go. None of us knew just where we were to go, whether there were numbered seats for us or whether we had to stand. Every inquiry met with a shrug of the shoulders; no one seemed to have any definite information. As we were all naturally anxious to get good places, the passage thru numerous halls and corridors, upstairs and down, was much like a football match. A fat correspondent from one of the German agencies bowled me over against a little woman from a daily in Prague. But she was so interested in the scramble that she didn't have time to listen to my apologies. At last a small door was opened and we tumbled into the gallery of the Throne Room.

An immense square room with simple furnishings, completely surrounded by a narrow gallery. The half which was nearest to the throne was closed, so we were crowded into the gallery round the rear of the room. The first impression was rather disappointing. I have seen many more beautiful rooms in other palaces. The throne, with the drapery, looked decidedly worn and tawdy. The coronation robe of ermine and cloth of gold was draped over the back of the throne. A few ushers in quaint uniforms and carrying long canes, the sign of their office, moved about the floor. Once in a while some functionary would walk thru, but otherwise the room was empty, and we were treated to another long and tedious wait.

Finally, the military officials entered. Their uniform was, of course, full dress and exceedingly brilliant. One very fat officer was dressed as a Hussar, high black boots, tight scarlet trousers, a blue

jacket and a mantle of crimson. The taste in colors exhibited by the Russian officers is not always of the best. But there was no uniform which was quite so startling and barbaric as that of this fat Hussar. He seemed always on the point of breaking out into some "opera bouffe" song. Every one was covered with decorations, and there was no end of gold trapping. They had hardly taken their places, when they were followed by the high civil officials. Senators, in scarlet frock coats, heavily faced with gold braid. The Mayors of the larger cities were there, in blue coats; they wore heavy silver chains and the keys of their cities. There was considerable disturbance in placing these men, as all were as anxious to be in the front row as little boys at a circus. The Councillors of State were placed at the right of the throne, and nearest to where the Czar would stand. The entire right side of the hall was filled with these men, resplendent in the glory which the Duma threatens. They stood there as the life guard, the loyal defenders of autocracy, and the divine right to call themselves noble. If they could not make their arguments convincing, they could, at least, make their uniforms dazzling.

There was a slight rustle among them when an advance guard of the enemy appeared. Three peasant deputies strolled into the room before their time. Two were dressed in high boots and caftans, such as are worn in the villages. The third had bought some city clothes and looked ludicrous. The clothes had evidently been ready-made and were never intended for anything like so large a man. They were met by a volley of hostile stares. But they stood their ground and strolled about the room for a few moments, nodding their heads gravely and speaking in whispers; then, having completed their reconnaissance, they retreated in good order to their main body in the anteroom.

A chorus of half a hundred little boys in scarlet vestments marched in and lined up around the altar and holy picture in the middle of the room.

Then came the Duma. They filed in solemnly and took places opposite the officials and directly below me. The quietness of their clothes was probably

emphasized by the gorgeousness of those on the other side of the room. They looked very gray and grim. Some were in evening dress, but the peasants came in their home clothes. A few Mussulmans and a Catholic bishop from Poland furnished the only bit of color on the Duma side. As I watched them march in I recalled the wonderful description which Carlyle gives of the procession of the Estates General on the 4th of May, 1789. Carlyle, however, had the advantage of history. The deeds of Mirabeau, and Marat, of Robespierre, and Dr. Guillotin, were all matters of record when he wrote. As I looked down on these men, called on the same mission, I tried, but quite in vain, to pick out which of these 400 odd would be the leader. There is no doubt that among them is a Mirabeau, probably a Marat, and possibly a Guillotin. A correspondent near me touched my arm and whispered:

"The first conflict between the officials and the Duma," and I looked down to where he pointed. The ushers were vainly trying to persuade the members of the Duma to occupy less space. The peasants, however, were not to be awed by the gorgeous uniforms, but stood their ground stolidly, and at last the officials gave it up.

The last touch of splendor was added when a dozen patriarchs of the Church, white haired and clad in cloth of gold, came in. They were venerable men, old almost to decrepitude. They seemed hardly strong enough to hold up their jeweled crowns. We could see out in the anteroom a Cossack regiment, the personal escort of the Czar, standing lined four deep. Again there was a long wait, and then three ushers came in and rapped for attention. Far off were heard the faint strains of "God save the Czar." Every one grew rigid with attention. The sound of music came nearer and the procession entered.

First came the Imperial Insignia, the Seal of State, the Sword, the Sceptre, the Imperial Banner, the Orb and Crown, each borne on a cushion by a high official of the Court, flanked by Generals with drawn swords, and on either side marched a file of veteran Grenadiers. They passed by the side of the altar and

deposited the insignia on stools around the throne. The Czar was in the room and almost halfway down before I recognized him. I had rather expected a flare of trumpets when he entered, or perhaps I was looking for a more kingly man. He seemed youthful, very nervous, and he walked with an uncertain stride. The Empresses came immediately behind him, and their whole demeanor was in striking contrast to his. One could not imagine more perfect poise. Their gowns were gorgeous, but the Czar was very simply dressed. Three of the oldest of the patriarchs met them in the middle of the room and went thru the long formula of the Blessing, springling them with hyssop, and presenting the cross to be kissed. When this formula was ended the choir started a "Te Deum." It was long and tedious, but it gave an excellent opportunity to observe the scene.

The Czar stood in the middle of the room, directly in front of me. His nervousness increased, his fingers twitched continuously. His wife stood at his right, the Empress Dowager at his left, and the Grand Dukes behind him. Beneath me were the members of the Duma, and beyond the wide aisle, the sea of gaudy uniforms. Witte and Dournovo, the two lately deposed Ministers, stood almost side by side. Witte, large and impassive. Dournovo, small and nervous. A little closer to the throne stood the new Premier, Gourimeekin. It was interesting to note how the different people responded to the religious ceremony. The Czar did not seem very much interested. The Grand Dukes, despite the rumors of their profligacy, appeared very devout and crossed themselves almost continuously. The peasants, who are supposed to be very religious, did not follow the service half so rigorously.

After what seemed an interminable time, the "Te Deum" was over and the Czar began again his progress toward the throne, the Empresses went to a little platform at his right, where they were surrounded by a crowd of the Court ladies. The Czar slowly ascended the steps to the dais, and sat for a moment on the corner of the great chair. It looked very much too big for him. He had seemed undersized when I first rec-

ognized him, but as he sat there in the gigantic chair he reminded me sharply of a picture which I had seen of Little Lord Fauntleroy. After a moment he stood up and an aide-de-camp handed him a stiff cardboard, on which his speech was written. He seemed to gain confidence, and during the reading of his speech was, for once, right kingly. He stood gracefully and read most distinctly. Every syllable was audible in every corner of the room.

The speech was exceedingly clever. It lasted for fully five minutes and did not say anything. But cleverness was not what was wanted. The people wanted frankness and the speech lacked that. The attention was great as he was reading. What he read would have been a very good introduction to a longer speech. Would he drop generalities and come down to particulars? Every one's ears were strained, the quiet was appalling, and this question was written on every face.

"And may God bless Me and you."

He lowered the paper and took the first clear look at his people. He had finished. An aide-de-camp sprang to his side and took the paper. The attention relaxed slowly. He had said nothing, but it took some seconds before this was realized.

It was a great and evident disappointment to the Duma. Every important question was dodged. The Duma takes itself very seriously; it did not come to St. Petersburg to be trifled with. In some instances the electors have told their deputies that if they cannot come back with the reforms it will not be wise to come back at all. They did not come to hear clever speeches.

Of course, it would not have been "statesmanlike," nor "diplomatic," for the Czar to have said anything on such an occasion; but—oh! for one word! One word that rang true and frank!

"Bravo!" "Bravo!" "Long live the Czar!" The applause was sudden and startling; after his quiet reading, but—localized. It came from the other side of the hall; from the officers, the officials, the Court attendants, and especially from His Majesty's personal staff. Directly below me the Duma was silent, sullen and grimly disappointed. Even the shrewdest

of them, those who had prophesied just such a speech, had hoped. "It is the greatest disappointment of my life," a Russian whispered in my ear.

The bureaucrats were disgusted at the and stood waiting while the insignia were marshaled before him. He looked timid again, but the roaring "Bravos" on the right and the grim silence on his left were too marked to pass unnoticed. His forehead wrinkled with displeasure. The cortège started. Every bow which he made to the right brought fresh vivats, to the left, silence, broken only by a few weak cheers. The look of displeasure changed to one of sullen anger, and in the last half of the hall he bowed only to the right.

The affair which had been launched with so much splendor was a bitter disappointment. He had pleased no one. The bureaucrats were disgusted at the very presence of these peasants and simple people, and the Duma had lost its last illusion. The lines are sharply drawn now. Those on the right of the hall are to have a death grapple with those on the left, and it is not likely that the Czar will count for twopence in the struggle. He lacked the courage to take sides.

The speech was very much as I had

expected it would be. But still it was a genuine disappointment. It is a bitter thing to see a man lose a glorious opportunity. There are very few who really know anything about the Czar. All his speeches are, of course, influenced, if not absolutely written, by others. But if he had thrown down that written speech and said a few frank words to his people, who were only half disloyal, the soldiers would not have been able to maintain order. The enthusiastic greeting would have passed all bounds. They were longing that he might be with them. They have certain definite things for which they have come to St. Petersburg; things that had been long pondered and earnestly talked over by their friends and things which they are quite resolved to get at any cost. They would have been glad if the Czar was with them. But they can no longer hope this.

After the Czar followed all the Court, ladies in wonderful gowns and officers in their glaring uniforms. But no one looked at them. The Duma waited, silently and impassively, till their turn to leave came. Few of them even spoke. The thing was so patent that there was no need to talk.

ST. PETERSBURG, RUSSIA.

## Halcyon Days

BY ERNEST T. PAINE

Ὡς ὁπότεν χειμέριον κατὰ μηνᾶ πινύσκη  
 Ζεὺς ἅματ' ἄματ' ἄματ' ἄματ' ἄματ'  
 λαθάνεμόν τέ μιν ὄραν καλέουσιν ἐπι-  
 χθόνιοι  
 ἱρὰν παιδοτρύφον ποικίλας  
 ἀλκυόνος. . . —Simonides.

To winter seas is given blessed rest;  
 A dream steals o'er the spirit of the deep:  
 The little waves forget and fall asleep—  
 Tired children on their sleeping mother's breast.  
 That day the spotted halcyon builds her nest,  
 And so begins her gentle watch to keep;  
 Sweet respite finding after billows steep—  
 Soft cradle where her young may be caressed.  
 In time of storm the anxious sailor prays  
 For halcyon birds, that they may quickly come.  
 We—other mariners, whose sail is riven  
 By wilder tempest—lift sad eyes to heaven.  
 O Star of Love! in mercy guide us home  
 To quiet seas and blessed Halcyon Days.

CENTRAL FALLS, R. I.

# What Is Electricity?

BY WILLIAM RAMSAY, K. C. B.

The most distinguished of all British chemists is Sir William Ramsay, Professor of Chemistry in University College, London, and the discoverer of that strange group of inert gases, argon, helium, neon, krypton and xenon. For the discovery of the first of these, he received, together with Lord Rayleigh, the Nobel Prize. The question he answers, what is the motive power of electricity, is one often heard, and altho it is usually asked to "make conversation," and with no desire for an answer, yet there are many persons who really want to understand it and would take the trouble to listen to an explanation which they could comprehend. Such an explanation we have here, which altho it deals with an abstruse subject and introduces some of the newest and most abstract conceptions of science, is written in such a clear and simple style that any educated man can understand it.—

(Prepared)

**A**N old friend of mine, by profession a banker, who has spent a large portion of his life of eighty-nine years in studying geology and astronomy, put to me lately the question: "Whence comes the motive power of electricity? I can understand the motive power of steam, but not of electricity."

This led me to think on the subject; and altho there is not much new in my reply, it contains, nevertheless, one novel point, which contributes, I think, to clearness of thought.

The answer refers only to electricity generated by a battery; not to a current made by means of a dynamo machine. The answer to the question, What generates a current in a dynamo? must be left till a later opportunity.

The simplest form of a battery consists of a vessel containing dilute hydrochloric acid, into which dip a copper and zinc plate, connected by a wire. A current flows thru the wire; its presence can be demonstrated by a galvanometer, or by dipping the wire from the copper plate and the wire from the zinc plate in a solution of iodide of potassium; a brown stain begins to appear at the end of the wire connected with the zinc plate; it is caused by the iodine being set free, which dissolves in the liquid with a brown color.

If it is desired to make the test more striking a little starch may be added to the solution of iodide of potassium. The color will then be blue, for iodine and starch give a blue color. Now, why does the current pass?

To explain this, let us consider what

happens to a lump of sugar lying at the bottom of a cup of water. After a few minutes the sugar will melt, or, more correctly, dissolve in the water. But the water at the top will not be sweet for a long time; the sugar takes a good many minutes before it spreads up into the water. Why? It is believed that sugar consists of minute invisible particles called molecules; and they are in motion.

Altho we cannot see molecules move, we may nevertheless make an experiment which will prove to us that particles of matter, easily visible under a fairly powerful microscope, are always in rapid motion.

An ordinary water color paint, rubbed with water, gives particles of a convenient size; gamboge is perhaps the best color to take. These particles are always "jigging" to and fro; their motion is not regular, but spasmodic; and they spread, in virtue of that motion; so that they move from one part of the water to another.

So it is with the sugar molecules; that they do spread is proved by the water becoming sweet, even at the surface. In fact the sugar particles try to move from where they are to where they are not. If one felt inclined to moralize on the subject, one might ask, is not that what we all try to do? Is not an attempt at motion what makes for progress of all kinds in the world?

If such motion could be hindered, say by a screen which would block the passage of the sugar molecules, while allowing the water molecules to pass, the sugar molecules would bombard the

screen, giving it innumerable blows, and these blows would make themselves evident as a kind of pressure on the screen.

This pressure has been measured; a partition has been found which allows the water to pass, while blocking the way for sugar. It is as if gravel of two sizes were being shaken on a sieve; the stones which pass thru the meshes do not press on the sieve, while those which are stopped by the sieve may be recognized by their pressure.

Substances other than sugar, too, can be stopped by the same screen; for example, tartaric acid can. And it has been found that the pressure produced by equal numbers of molecules or particles of sugar and of tartaric acid, contained in equal volumes of water, is equal.

Common salt is a compound of a metal named sodium and a yellow green gas called chlorine. Each molecule or particle of salt must therefore contain these two elements; that is, each particle must be made up of at least two smaller particles, and these smaller particles are called "atoms." If a spoonful of salt be placed at the bottom of a glass of water, like the sugar, its particles will wander thru the water, so that, after some time, the water will become salt all thru.

Just as with sugar, it is possible to find a membrane which will allow water to pass thru it, while it stops the passage of salt; and it is possible to measure the pressure of molecules of salt on the membrane.

Now, here a very curious thing has been found; molecules of salt give twice as great a pressure as an equal number of particles of sugar, spread thru the same volume of water; it looks as if there were twice as many particles of salt present. And it is supposed that there really are twice as many. To account for this, it is believed that each molecule of salt splits up into two atoms, one of sodium and one of chlorine, and that each atom plays the part of a molecule, in so far as it is able to raise pressure. Owing to the habit which such minute particles as the atoms of sodium and chlorine have of moving about in a watery solution, they are named "ions," a Greek word, which means "wanderers."

But an ion is not merely a wandering particle; the moving particles of sugar are not called ions. The ions contained in a solution of salt have another peculiarity; one has gained, and the other has lost, what we may term an atom of electricity. Now, what is electricity?

It used to be believed, formerly, that there were two kinds of electricity, one called positive and the other negative. At that time it would not have been possible to answer the question. But recent researches make it probable that what used to be called negative electricity is really a substance. Indeed the relative weight of its particles has been measured; each is about one seven-hundredth of the mass of an atom of hydrogen; and the mass of an atom of hydrogen is the smallest of all masses of what we have been used to call matter.

Atoms of electricity are named "electrons"; they appear to be all of one kind. The metal sodium, and indeed all other metals, may be regarded as compound of electrons with a stuff which may be named "sodion" for sodium, "cuprion" for copper, "ferrion" for iron, and so on. When sodium loses an electron it becomes "sodion"; when iron loses three electrons it becomes "ferrion," and similarly with the rest.

How can sodium be made to lose its electron? This happens when it enters into combination. When sodium is heated in air, which contains oxygen gas, it burns, and is said to unite or combine with oxygen; burning appears to be accompanied by a transference of an electron from the sodium to the oxygen. Common salt may be made by heating sodium in chlorine gas; it takes fire, burns and is changed into white, ordinary salt. It has lost an electron; chlorine has gained one.

When dissolved in water, the sodium exists in the water as sodion; that is, sodium less an electron. The chlorine is in the water, not as chlorine; by gaining an electron, it has been converted into chlorion. We see, therefore, that those elements which we call metals become ions by losing electrons; while those which we call non-metals become ions by gaining electrons.

Let us now consider the simple battery or cell, consisting of copper and a plate

of zinc, each dipping in a jar half full of dilute hydro-chloric acid. This hydro-chloric acid consists of a number of ions of hydrogen, and ions of hydrogen differ from ordinary hydrogen gas in the same way as ions of sodium differ from metallic sodium, namely, by each atom having parted with an electron. The electron which each atom has lost has attached itself to an atom of chlorine, and the chlorine atom is thereby converted into an ion.

The plate of zinc cannot dissolve in the water, until its atoms have been converted into ions. They would thus each have to part with two electrons. But the attraction of an atom of zinc for these two electrons is so great that the zinc does not dissolve, unless, indeed, the electrons can be supplied from elsewhere.

Now, electrons have the power of traveling thro metal; this point will be considered later; it must be accepted for the present. When an atom of zinc gives up its two electrons to the zinc plate, the atom of zinc which lies nearest to that which has parted with these two electrons will be overloaded; it already is in combination with its own two, and cannot unite with two additional ones; or, if it does, it must pass on its own electrons to the neighboring atom.

These two electrons, therefore, displace others, or, it may be, are themselves transmitted thru the zinc, until they reach the copper wire. Copper, in the metallic state, is also a compound of copper ions with two electrons; and the copper, like the zinc, is overloaded by the electrons from the zinc. Hence it transmits them to the copper plate, and they find their way to the surface of the plate.

There they find hydrogen ions, which are ready to combine each with one electron in order to form hydrogen atoms; and, having combined, the atoms of hydrogen unite in couples, bubbles of hydrogen are formed, and float up to the surface and burst. In short, the zinc passes on its electrons thru the copper wire to the copper plate, when they are transmitted to the ions of hydrogen in solution, and these first become atoms and then molecules.

These conceptions, which are rather intricate, may be rendered clearer by

means of a diagram. *a* is the solution of hydrochloric acid in water; *b* is the zinc plate; *c* is the copper plate, and *d* the connecting wire. *H H*, on the left of the diagram, are two atoms of hydro-

gen, each of which has gained an electron; they will unite together to a molecule, and escape in a bubble up thru the liquid. The electrons which they have gained have followed the arrows from the zinc plate, along the copper wire and down the copper plate.

A zinc atom minus its two electrons has left the zinc plate; it is now a zinc ion. These two electrons have displaced other electrons from their combination with zinc and copper; and it is these electrons, or their substitutes, which have attached themselves to the hydrogen ions. There are hydrogen and chlorine ions in the liquid. The hydrogen ions move toward the copper plate, and the chlorine ions toward the zinc plate, but less rapidly.

Some of these will touch the zinc plate; and if they could pass round the circuit, thru the wire, there would be no electric pressure; but it is because the plates and the connecting wire are impervious to matter, while they are pervious to electrons, that electric pressure—or, to give it the usual name, electromotive force or potential—is developed. In fact, the metals and the wire are semi-permeable membranes; they allow electrons to pass, while they block the passage of matter.

Perhaps the idea may be somewhat

more easily grasped if it is put in another form. Electrons do not pass thru water; probably because the treble combination of electrons, hydrogen and oxygen is too firm to allow of the transference of electrons from one molecule to another. But when a salt is dissolved in the water electrons can pass, for they easily transfer themselves from one place to another, carrying along with them atoms such as chlorine. Their progress is much impeded thereby; but, as explained before, they are easily transmitted thru metals, and thus, again, electric pressure is developed.

The analogy with "osmotic pressure," as the pressure of the sugar molecules dissolved in water against a semi-permeable membrane is called, is obvious; just as the water in which the sugar is dissolved can pass in and out thru the semi-permeable screen or partition, so the electrons can pass backward and forward thru the metallic plates and wire; and just as the sugar molecules are unable to traverse the membrane, so the matter with which the electrons are in combination is unable to pass thru the metal. The metal is thus a semi-permeable membrane, and electric pressure is developed in consequence, in the same way as osmotic pressure is developed by the sugar in solution.

If a weak solution of common salt be boiled down, after sufficient water has been evaporated away, crystals of salt separate out and deposit. Now, the weak solution contains the constituents of the salt almost entirely in the state of ions; that is, the sodion is without an electron, which, if added, would convert it into the metal sodium; and the chlorion would be the element chlorine, if it could part with its electron.

During concentration, as the water evaporates, the ions of sodium and chlorine are brought nearer each other, and they combine to form solid salt when enough water has been removed. But even when combined to form salt in the solid state, the electron does not leave the chlorion and attach itself to the sodion; if that happened the result would be metallic sodium and chlorine gas; and they are certainly not formed. A crystal of salt differs from a solution of salt in much the same respects as a piece of ice

differs from water; the one is solid and the other is liquid; but evidently the same *stuff* is there; the only difference is in the solidification.

It must therefore be supposed as a legitimate inference that when a lump of sodium unites with chlorine and burns in it as a lump of coal burns in air, the act of combination consists of the transference of an electron from the sodium metal to the chlorine; the result of this transference is to convert the sodium metal into sodions and the chlorine gas into chlorions. These are substances with quite different physical and chemical properties from the metal sodium and the gas chlorine.

On dissolving in water, some of the chlorions and sodions, but if the solution is concentrated, only a few, become separated; and if water be added to dilute the solution, a larger and larger number separate, until at a sufficient dilution all are separated. In fact, if this conception be extended, all chemical combinations should be regarded as the transference of electrons from one set of elements to another.

But not all compounds are split into ions when they are dissolved; it may be conjectured that in the case, for instance, of such a compound as sugar, which dissolves in water as such, the atoms of carbon, hydrogen and oxygen, of which it consists, have interchanged electrons, otherwise chemical combination would not exist; but that the ions do not part from each other, even when opportunity is given by dissolving the sugar in water.

Altho facilities for motion in many cases lead to separation of ions, it does not follow that when facilities are present separation will always take place.

When common salt is melted, which takes place if it be heated to redness, the ions separate; that this is the case is proved by its being then able to conduct electricity. Melted glass is also a conductor, altho solid glass is not; and the reason again is probably in the fact that the ions have no freedom of motion in the solid.

These considerations, however, tho closely connected with the nature of ions, are not in such close touch with the subject of this essay, the motive power of electricity. Perhaps a last analogy

may make the explanation which I have tried to give somewhat clearer; it is (1908.)

Place a dilute solution of salt in one vessel and a concentrated solution in another; cover both vessels with a bell jar; pump out all air, so that the bell jar is filled only with vapor of water, and leave the whole standing for a long time. The weak solution will grow stronger, for it will evaporate and the strong solution will grow weaker, for the vapor of water will condense in it. Now, imagine that the two salt solutions are placed not under the same bell jar, but under two separate bell jars, and that these bell jars are connected by a pipe. In the middle of this pipe is a little engine; the pipe from the weak solution enters the steam pipe of the cylinder, and the pipe leading from the cylinder, which would in an ordinary engine lead to the exhaust, is connected with the bell jar containing the stronger salt solution; then, if the engine is delicate enough, it will be driven by the current of vapor passing from the weak salt solution to the strong one.

Why? Because altho steam can pass away from the surface of the water salt cannot; the surface of the water is a diaphragm which will allow steam to pass, but which is impenetrable for salt.

The analogy with a battery is this: The zinc plate is like the weak solution

of salt; when it dissolves it gives up electrons at its surface; these electrons can pass along the wire, which is the analog of the steam pipe; if required, a small magneto-electric engine could be interposed so that it would be driven by the current passing thru the wire, that is, by the stream of electrons, just as the steam engine is driven by the current of steam.

On arriving at the copper plate the electrons combine with hydrogen ions and escape; and in this respect the battery described resembles rather a high pressure engine. But if desired the electrons may be kept in the system; it is only necessary to surround the copper plate with some substance such as sulphate of copper, and the electrons are retained by uniting with the copper ions, when copper atoms will be deposited on the copper plate.

Just as the surface of the water forms a diaphragm thru which salt cannot pass, while steam can, so the surface of the zinc plate forms a diaphragm thru which matter such as zinc, hydrogen or chlorine ions cannot pass, while electrons can, and they are also able to be conveyed by the wire, as steam is conveyed thru the pipe. The motive power both of steam and electricity, in a word, is due to their passing from a region where their pressure is high to where it is low.

LONDON, ENGLAND.

## A Castle in Spain

BY DAVID STARR JORDAN

I KNOW a castle in the Heart of Spain,  
 Builded of stone, as if to stand for aye,  
 With tile roof red against the azure sky—  
 For skies are bluest in the Heart of Spain.  
 So fair a castle men build not again.  
 'Neath its broad arches, in its courtyard fair,  
 And thru its cloisters—open everywhere—  
 I wander as I will, in sun or rain.  
 Its inmost secrets unto me are known,  
 For mine the castle is. Nor mine alone:  
 'Tis thine, dear heart, to have and hold alway.  
 'Tis all the world's, likewise, as mine and thine;  
 For whoso passes thru its gates shall say,  
 "I dwelt within this castle; it is mine!"

STANFORD UNIVERSITY, CAL.

# The Hague Palace of Peace

ANDREW CARNEGIE appreciates the importance of giving "a local habitation and a name" to "the forms of things unknown" that "the imagination bodies forth." By his gift of \$1,500,000 to erect at The Hague a Court House and Library for the Permanent Court of Arbitration he has done more to ensure the permanence and pre-eminence of that institution than many a treaty. The competition for the design, which was thrown open to the architects of all nations, closed April 15th, 1906. On account of the prestige of winning the prize for designing the building that many hope will be the capitol of the federation of the world, the foremost architects of every country devoted much time and expense to the preparation of plans. The jury of award consisted of the following architects: Collcutt, of London; Cuypers, Holland; Ihne, of Berlin; König, of Vienna; Ware, of America, and Nénot, of France. Plans were submitted to the number of 3,038 by 217 architects. The prizes were awarded to the following contestants:

First Prize (\$4,800), to L. M. Cordonnier, of Lille.

Second Prize (\$3,600), to Marcel, of Paris.

Third Prize (\$2,800), to Franz Wendt, of Charlottenburg.

Fourth Prize (\$2,000), to Otto Wagner, of Vienna.

Fifth Prize (\$1,200), to Howard Greenley and H. S. Olin, of New York.

The winning architect, M. Louis-Marie Cordonnier, was born in 1854. He was the son of an architect, and entered his first international competition at the early age of nine, when he

won in London a first prize for penmanship. He studied for five years in the Ecole des Beaux Arts, of Paris, and established himself at Lille. He was only thirty-one years old when he gained an international reputation by obtaining the award for the Chamber of Commerce in Amsterdam, for which 170 of the best European architects competed. But his greatest work hitherto is the Hotel de

Ville or City Hall of Dunkirk, which was dedicated by President Loubet in 1901.

The influence of the ideals of the modern Hotel de Ville architecture of France and Belgium is shown in his design for The Hague Palace of Peace. It is a development of the northern French chateau style. The problem was a difficult one on account of its novel features. People have a somewhat definite idea of how a church or a city hall should look, but there are no precedents for an International Hall of Arbitration combined with a library. Consequently there is

unusual diversity of conception in the designs submitted, as illustrated by the contrast between that of M. Cordonnier and that of Messrs. Greenley & Olin, who were the only American architects to receive a prize. The specifications of the official program announcing the competition gave great latitude to the architects. The principal stipulations were that the building should provide a grand vestibule with staircase, a large hall for the assembling of the International Court of Justice, smaller rooms for councils and committees, a stack room for the library, reading rooms, map room and a vault for the preservation of the archives.

L. M. Cordonnier, of Lille, France, who took the First Prize.

The Design for the Hague Peace Palace Which Received the First Prize. By L. M. Cordonnier, of Lille.

Principal elevation for the permanent Court of Arbitration or Peace Palace at The Hague, Holland, from the premiated drawings submitted in competition by Howard Greenley and Herbert S. Olin, architects, No. 12 West Fortieth street, New York City. The building, as designed, is a modern conception of the Italian classic style. The elevation herewith reproduced, approximately 270 feet in length, accuses the principal entrance and the great courts of arbitration.

# What London Talks of Now

BY JUSTIN McCARTHY

LONDON has some stirring topics with which to occupy its thoughts and its talk at the time when I am writing this article. There is, for instance, the withdrawal of the Sultan of Turkey from the defiant position which he had until now been holding against the imperative demands of the English Government that he should withdraw his forces from that part of Egyptian territory which lies outside his frontier.

The Sultan held out until the ultimate limit of the time allowed to him for a decision, and now at last he appears to have got off his high horse and undertaken to walk humbly out of the forbidden territory. The severe philosophical moralist might perhaps be inclined to ask what greater right England had than Turkey to any lordship over Egyptian soil, but at such a crisis as the present society does not much trouble itself to go into questions of political morals and there are few indeed in these countries who would not welcome almost any political crisis which promised to bring about the utter extinction of the Ottoman Government in Europe at least, where it has during its whole existence been a continuous source of oppression, of moral and physical debasement, of servitude and of bloodshed.

If it had come to the lot of England to be the means of putting an end to Ottoman dominion in Europe such an act would have been but a fair atonement for the

part she took in organizing the defense of Turkey during the Crimean War. I must not, however, wander from my immediate subject, which is the fact that we have now something to talk about in the announced declaration by Turkey that she has at the last moment made up her mind not to tempt the fates too far and that she will meekly submit to the firm command of England.

Then, of course, among our topics of conversation we have the great Education question. The prospects for the passing of the measure by something in the nature of a reasonable compromise seem to have grown much brighter within the last few days. There are many indications that the Government is growing more and more willing to arrange for such a compromise. Of course the Liberal Ministry have behind them such a large majority that they might reckon on votes enough to enable them to force the measure on the House, even in its

Lord Currie.

present shape. But then this would be a course of policy which enlightened men, liberal minded men, as most of the present administration are, would not be in the least degree likely to undertake. To adopt such a course would be to estrange a large proportion of the men who adhere to the principles of the English State Church and of all the Roman Catholic population of these islands, and it is in the last degree improbable that the present Ministry would think of adopting such a course. We

know in fact that the Marquis of Ripon is an influential member of the Government and that he is a most resolute and devoted Roman Catholic, and thus far at least he has not resigned his seat in the Cabinet, which I take it for granted he would be perfectly certain to do if no concession were to be made to the feelings of the Catholic population. There seems to me to be no serious difficulty in the way of introducing such modifications in the present measure as might do justice to the religious principles of every section of the community and yet make it as practical and genuine a measure of national education as statesmen or people could desire.

Then we have a subject of the profoundest interest which now comes before us with a sudden force of new intensity and interest, the great, the thrilling question of labor—the question as to the means by which the working people of England, Ireland, Scotland and Wales are to be enabled to keep themselves above the reach of actual starvation. One imperative reason for the demand that this great problem shall at once be taken into the fullest and most earnest re-consideration is found in the fact that the Labor party is now and for the first time an organized force in the House of Commons.

We have at various intervals during past generations had efforts made to deal with that terrible problem of labor and poverty, of labor and its due reward, and many powerful appeals have been made from platform and from pulpit by the poet and by the writer of newspaper articles to arouse the sympathy of the rich and the powerful, of the capitalists, the landlords, the employers of that vast mass of the working population who are working at starvation prices. Some of our most popular modern novelists have called in fiction to help the cause of truth. Thomas Hood thrilled

humanity with his "Song of the Shirt." George Augustus Sala, at a time within my own remembrance, wrote a vigorous and touching essay on the same subject, in which he spoke of the amount of work done for the lowest possible prices in the making of clothing for the plaything puppets beloved by children, and he added, with a grimly humorous pathos, that bad as it was to have human creatures working at starvation prices for the making of men's shirts it seemed even more ghastly to have them working at starvation prices for the making of dolls' chemises. All these appeals, however, did not succeed in arousing the public into any systematic and persistent attempt to deal with this great national evil, but now we find that we have at last entered on a new chapter of this story.

The working men have now for the first time a strong and well organized representative party in the House of Commons, and they have thus got the one great platform from which they can command the attention of the whole country. "Oh! that its tones might reach the rich," sang Thomas Hood while making his appeal

\* for the cause of overworked and starving labor, and now at last the time has come when its tones must not only reach the rich, but must command and compel the attention of the rich and force them to seek for, with genuine resolve and to find without delay, the remedy for the evil.

Labor will now play a most important part in every political movement and at every Parliamentary election. It is now one of the factors in the carrying on of the State, and will have to be reckoned with at every political crisis. Just as the Irish National party has forced their demands on the consideration of every Ministry and every Parliament and has made it impossible to avert for long its final settlement, so the Labor party will make the cause of the poor

Mrs. Hugh Chesson.  
(Norah Hopper)

and underpaid workers, the cause of the "sweated" industries, a subject for the immediate attention of every aristocratic club, of the members of the Stock Exchange, of the landlords, the merchants, the financiers and the money gamblers.

The proprietors of the *London Daily News* have lately been assisting and advertising the cause of the suffering workers by opening a bazar in illustration of the "sweated" industries, a bazar in which specimens of the underpaid goods are exhibited by their impoverished makers, men and women, and the prices of each article are made public.

I am glad to say that this exhibition has already attracted the attention of all classes, and that royal princesses have been among its most frequent visitors and have shown the deepest interest in conversing with the working men and women who exhibit the articles and hearing from them the story of their work and their pay and their lives. I do not by any means believe that the aristocracy or the capitalists or the wealthy classes of any order are without sympathy for the sufferings of the overworked and underpaid when

once their attention has been drawn to the subject, and we may be sure that the Labor party will now take good care that such attention shall never be withdrawn until the remedy has been found. A new chapter now opens in our history.

The death of the first Lord Currie, which took place a few days ago, has created a deep sensation among all interested in diplomatic and political affairs, altho the death had been expected for many months past. Lord Currie had not far passed his seventieth year when he

died, and he had led a long and remarkable career as a diplomatist. He had been engaged on behalf of England in almost all the great diplomatic arrangements of Europe during his time; had been Lord Salisbury's private secretary, and had been permanent Under Secretary for Foreign Affairs and had afterward been Ambassador Extraordinary to Constantinople. The death of Lord Currie followed after a few months' interval that of his loved and loving wife. Lord Currie was already prostrate with illness when his wife sank under the mal-

ady which proved fatal to her. He was then in so critical a state that his physicians would not allow him to be told of his wife's death, fearing that it might precipitate his own fate. He remained, therefore, for a considerable time in ignorance of Lady Currie's death and had not long to wait after he heard the sad news until his own death followed it. Lady Currie was very much younger than her husband, and was a very charming woman in face and form, intellect and manners. I had the pleasure of knowing her while she was still Mrs. Singleton.

She was then the

widow of Mr. Henry Singleton, her first husband, and she was distinguished as a poetess and a novelist under the assumed name of "Violet Fane." I used to meet her often at one time, and have delightful recollections of her vivid and varied conversational powers, of her keen interest in literature and art and of her sympathetic nature. She was always one of the brightest figures in any company which surrounded her. Lord Currie and his wife had no children, and the peerage becomes extinct. Its existence be-

Richard Whiteing.

gan and ended with the one peer, who had won the title by his many and valuable diplomatic services.

The sad death of Mrs. Hugh Chesson, known to the world as "Nora Hopper" before her marriage five years ago to Hugh Chesson, the novelist and critic, is a great loss to English literature. She was one of the very few genuine poetesses of her time. Altho she was only thirty-five when she died she had been a well known writer for ten years and had published three volumes of poems as well as other works. Her last published volume was a novel called "The Bell and the Arrow," of which I wrote in *THE INDEPENDENT* at the time. It was an extremely clever story, full of the poetic charm which belonged to everything she wrote, and it showed that she was likely, if she had lived, to make as great a success in novel writing as she had already done in poetry. Many of her poems have appeared in newspapers and magazines since her last volume of verse, "Aquamarines," was published in 1902. No one could express better than she the Celtic spirit, which has become such a moving force in our times. Of her many beautiful poems, one of the most beautiful is "The Dark Man." Exquisite also are "Deelish" and "Hugh of the Hill." Her sense of beauty was wonderful, and it suffuses all her writings. Mrs. Chesson was not born in Ireland, and in fact had never lived there, but she was a true Celt all the same.

The reading public have been looking forward for some time to the appearance of Mr. Richard Whiteing's new book, "Ring in the New," which has just been published by Messrs. Hutchinson, and it will be read eagerly by all who are interested—as every one who thinks must be—in the topics of which he writes, as no other living English novelist can write. In telling the story of Prue Meryon, Mr. Whiteing tells also of the problems which are absorbing the interest of all who think at the present moment—the struggles of the poor and

the unemployed and the hope that is arising for the future of both in the success of the new labor movement. It is impossible for me in the short space I have at my disposal to say all that I want to say about Mr. Whiteing's book—every page of it is so full of ideas that in spite of the absorbing interest of the story one wants to stop and read passages over again and think over them. How wonderful is the description in Chapter V of Prue watching from London Bridge the crowds returning from their work, and how exquisitely beautiful is the chapter telling of the play which Mary Lane produces and takes on tour in the English villages. The hero, George Leonard, is such an interesting type that one wishes one saw more of him, and is rejoiced that the story ends happily for him and Prue and also ends on a note of hope—almost the last words are "Ring in the New."

Mr. Percy White's new novel, "Mr. John Strood," just published by Messrs. Constable, is an extraordinarily clever study of character, all the more clever as it is done from the inside—I mean that John Strood, in telling the story of his friend, draws his own character. In this way it resembles Mr. White's first novel, "Mr. Baily-Martin," but it is an even more subtle character study. Mr. White always makes his characters so living and human that one cannot help having a certain amount of sympathy with them even if they are not admirable in themselves. One feels as if he had known John Strood all his life, and the character of Lawrence Rivers is as well drawn in its way. The minor characters, as in all Mr. Percy White's novels, are real and living. Occasionally some of the reflections of John Strood have a charm and a sense of beauty which seem to belong more to Mr. Percy White himself than to Mr. John Strood—perhaps this is one of the reasons for the readers' sympathy with him, while another reason is certainly found in the personalities of his wife and of his step-mother.

LONDON, ENGLAND.

# Our Beau

BY JAMES RAYMOND PERRY

“I ‘M eight and Marian is seventeen. She says she’s eighteen, but she isn’t; her birthday is in January and it’s only June now. Marian is my sister. She wears her hair up, but I remember when she wore it braided down her back. Sometimes she wears it down now—mornings, but afternoons she puts it up; and then she thinks she’s a young lady.

“She’s got an awfully pretty hat this summer. When she gets her hair up and that hat on she looks like a young lady; tho I wouldn’t tell her so. It’s coarse straw and got lots of flowers on—white and pink.

“The way she treats me you’d think she thought she’d always been a young lady. But the first doll I ever had she wanted herself, and kept dressing and undressing it, pretending she was showing me how. I told her about it the other day, and she said ‘twas no such thing. But ‘twas.

“She’s got a new dress, white, trimmed with pink, and it’s got short sleeves, so you can see her arms up to her elbows. It’s all fluffy. I don’t remember what they call it; but it’s real pretty.

“Her hair’s yellow. Sometimes it looks real shiny, as if the sun was shining on it, when it isn’t. I don’t know what makes it look that way. Mine don’t. My teacher says I ought to say ‘doesn’t instead of don’t,’ but I’m not going to. I don’t want to be different from everybody else. She’s got blue eyes; but she was telling mama that Mr. Darcy thought they were black. That’s funny, because they’re blue, plain enough. Mr. Darcy’s sweet on her. But she don’t care anything about him, and never did. He’s got a wart on his cheek. Besides, his hair’s kind of a light red, and he don’t let it get more than a quarter’f’n inch long before he has it cut again. I heard him say so.

“She’s got some of the prettiest stockings; open work, with—— But you’d think ‘twas Marian I’m telling about,

when ‘tisin’t at all. It’s Mr. Kensington. He’s got black eyes and brown hair, and’s lots nicer looking than Mr. Darcy; Mr. Darcy’s eyes are kind of a light drab. He’s taller than Mr. Darcy, too, and talks deeper. Mr. Darcy laughs every time he says anything. Mr. Kensington’s name’s Kenneth. You’d think ‘twas a name out of a book, but ‘tisin’t. He and I got acquainted before the others knew him at all.

“I was swinging down in the yard one morning when he came along, and he said ‘Your name’s Wadsworth, isn’t it?’ Then he wanted to know my first name, and said he’d swing me. He jumped the fence and swung me ‘way up till my feet almost touched the branch, and he said he knew us if he hadn’t ever seen us, because he was Kenneth Kensington, and his folks lived in the next house. He’d lived somewhere else ever since he was a boy, but his folks had told him about us. He’s got a sister older than Marian. She’s been to the house lots. She isn’t as pretty as he is. Her nose turns up. He said he’d only just come, and he was hurrying up and getting acquainted. He said didn’t I think he was hurrying up when he introduced himself to young ladies the way he did to me. ‘Twould have made Marian mad to hear him call me a young lady. But that’s what he said. He gave me a longer swing than anybody ever did, and wanted to know if Marian ever swung. I wonder how he knew her name. I didn’t tell him.

“When he jumped back over the fence he said: ‘Good-by, Josephine; I’m coming again pretty soon, and I’ll swing you again if you want me to.’

“Marian was on the piazza when I went up, and I told her I’d got a beau. She said I wasn’t old enough and I said I was, and I’d got one and she couldn’t guess who. I said his name began with ‘K’ and his other name began with ‘K,’ and she said she knew who ‘twas, and I said ‘who?’ and she said ‘I know,’ and I said ‘*who?*’ and she said, ‘Oh, I know,’ and she wouldn’t tell who. Then I said,

'Has he got blue eyes?' and she shook her head, and I said, 'Has he got light hair?' and she shook her head; and I said, 'Is he short?' and she shook her head, and I said 'Is it Mr. Darcy?' and she shook her head. So I guess she knew, if she hadn't ever seen him.

"I went down to the swing in the afternoon, and pretty soon he came and took off his hat, just as Mr. Darcy does to Marian, but never to me. And he jumped the fence and said he'd swing me, and he hadn't swung me more than a minute when Marian came down. She had on her new hat and gown and open work stockings, and looked terribly fine, and she called 'Josephine!' and pretended she thought I was alone, and then she said, 'Oh, I beg your pardon,' and he took off his hat and laughed—he's real handsome when he laughs—and said: 'Miss Josephine has been good enough to let me swing her, and we feel quite well acquainted now.' Then he said: 'Won't you please introduce us, Miss Josephine?' and I said: 'Marian, this is Mr. Kenneth Kensington. He's my beau that you couldn't guess.' Then they both laughed, and he said he wanted to know her, because his sister had written so much about her. And Marian said she'd wanted to know *him*, because Kate had told her so much about him. Then Marian said she'd missed Kate *so* much since she went away, and she was glad she was coming back next week. And he said he was, too. I didn't know she was his twin; I thought twins always looked just alike and dressed just alike; but *they* don't.

"He didn't swing me while he was talking, and I stood up and swung myself. You can, if you keep bending out and in; only you can't swing up high that way. But after a while he began, and I sat down, and he swung me up real high. Then he said: 'Let's let the old cat die.' That means just swing till you stop. And when the old cat was dead he asked Marian if she didn't want to swing. She hasn't swung since summer before last, because young ladies don't, she says. But she laughed and got in, and he began swinging her, and she said: 'Don't swing me high'; and he kept swinging her higher, till she began to scream, and say: 'Oh, stop me, I'm

dizzy'; and then he took hold of her and stopped her, and she got out, and her face was red.

"He walked up to the house and sat on the piazza for more'n an hour, and she said he must come again real soon, because we were such near neighbors we ought to be neighborly; and he said he would.

"The next morning I went down and was swinging myself that way when Marian came down and said *didn't* I want her to swing me? She hasn't swung me since summer before last. I said I didn't care, and she swung me about a minute, and then said she'd got to sit down and rest. She kept looking toward the next house, and I knew what for, but didn't tell. He didn't come; but in the afternoon when I got back from Winnie Drake's he was on the piazza. He staid till 'most supper time, and when he went he said he hoped that the next time I'd stay at home. He said it looked as if I didn't care much for my beau, going off that way. But I'd like to know how I could know he was coming.

"He came over and swung me lots, and one morning Marian came down, and he asked her if he shouldn't swing her, but she said No, it made her dizzy, and, besides, she was too old to be swung. But she staid, and they talked, and I swung myself that way till I got kind of tired of it, and I said: 'I don't think much of a beau that lets his girl swing herself while he talks to other girls.' Then he said: 'I beg your pardon, Miss Josephine; I didn't mean to.' Then he swung me real high, and the last time he run clear under me, and my feet almost touched the branch, and then he let the old cat die.

"The next day, or next to the next—I don't just remember—we went blue-berrying. I was going over to get Winnie, but I met him, and he wanted to know why couldn't he go. He said: 'Wouldn't Marian like to go, too?' and I said she'd gone down to the village to buy some things. The berries were awful thick, and he picked into my pail because he hadn't any. He can pick awful fast. There was a cow there that shook her horns; but he said if I just stood and looked she wouldn't hurt me, and I just stood and looked, and she

walked away. It didn't take any time at all to get the pail full, and when we were telling Marian afterward she said she'd like to have gone, too. She hasn't been since summer before last. I've asked her, and she said she didn't want to. He said: 'Let's go tomorrow morning,' and she said 'All right.'

"He picked into my pail awhile, and then he said he must help Marian, and I went off and found a bed where the berries were awful thick, and I said: 'Come here; they're awful thick here!' but they staid where they were, and when I looked they were sitting on a log and weren't picking.

"Pretty soon I heard a noise, and looked round, and there was the cow; and she shook her horns, and Marian screamed and caught hold of his arm, and he laughed and said the cow wouldn't hurt her; but she was scared and wouldn't stay. Her pail wasn't more'n half full, and mine was almost heaping.

"He came and sat on the piazza lots, and got so we knew him real well, and I'd sit on his lap because he was my beau. He took Marian to ride one evening, and I was sitting on the piazza, pretending I was reading, and he didn't speak to me; and the next morning I was swinging that way and he jumped the fence and said 'I'll swing you,' and I said 'I don't want you to,' and he said 'Why?' and I said 'I don't like you,' and he said 'Why?' and I said 'I don't think much of a beau that won't speak to his girl,' and he said 'When wouldn't I speak to you?' and I said 'Last night,' and he said 'You were reading,' and I said 'That don't make any difference; you ought to speak to me if I am reading,' and he said 'If you'd stopped reading and spoken to me I'd spoken to you,' and I said 'I don't think much of a beau that takes another girl riding,' and he said 'Well, next time I'll take you,' and I let him swing me.

"Mr. Darcy didn't come much. Then he got to coming again, and Marian was nicer to him than she was, tho his hair was just as short and reddish as ever. And Mr. Kensington, he didn't like him very well, and when she'd talk to Mr. Darcy he'd talk to me, and wouldn't talk to them.

"One night he came and said 'Where's Marian?' and I said 'She and Mr. Darcy went to ride,' and he didn't laugh. He didn't come nights after that; but Mr. Darcy did, and they went riding, and he kept coming; and Marian wasn't nice to him after a while, and they didn't either of them come. And Marian was cross to me, and didn't laugh, 'cept when she had to.

"One time I was down swinging that way when he went by, and I thought he'd jump the fence and swing me, but he didn't, and he didn't look; and I didn't say anything. If he didn't want to look he needn't. The next time I didn't look, but just swung awful hard to show him he needn't swing me. Marian was down there once; but she wasn't swinging me; and he didn't look, and I didn't look, and she didn't. And when he'd gone I said: 'He ain't my beau; I've jolted him.' And she said 'Jolted him?' and I said 'Yes, jolted him,' and I swung myself real hard, and she kind of laughed a little, but not much.

"Once I saw her crying, but not so you could hear her, and ma said kind of cross, but not real cross: 'Well, it's your own fault,' and she didn't say anything, but went upstairs.

"His sister didn't come when they thought she would. Somebody was sick and she had to stay.

"I saw him riding one time with Mattie Ames, and he didn't look, but Mattie said 'Hullo, Josie,' and I didn't say hullo. Mattie Ames used to go to school with Marian, and they were together lots, but she don't come to the house now, and Marian don't. I mean she don't go to *her* house. And the other day I heard her tell Blanche Howe that she hated Mattie Ames. She said she was a hypocrite. I asked ma what one was, and she said 'twas some one who pretended to be your friend and wasn't.

"We were down to the beach two weeks in August, and when we came home I was down swinging that way when he came by. I didn't look, but he jumped the fence and said shouldn't he swing me. But I jumped out and sat on the bench, and he sat down and said 'Wasn't he my beau any more, and I said No, I'd jolted him.' And he said

What had I jolted him for, and I said 'I don't think much of a beau that don't look when he goes by,' and he said 'I don't think much of a girl that don't look when her beau goes by.' Then he said 'Is your sister at home?' and I said 'Why?' and he said he wanted to see her, and I said 'She don't like you,' and he said 'Why?' and I said 'I shouldn't want to go riding with a hypocrite,' and he said 'Who has been riding with one?' and I said 'You have,' and he said 'Who was it?' and I said 'I guess you know,' and he said 'No, he didn't know; who was it?' and I said 'Her last name begins with A and her first name begins with M, and that's all I'm going to tell.'

"He said 'I didn't go riding with her till some one else went riding with some one,' and I said 'Who?' and he said 'I guess some one thinks Mr. Darcy is pretty nice,' and I said 'No, they don't; she don't care the tip of her little finger for him,' and he said 'How did I know?' and I said 'She said so,' and he said 'Folks didn't always mean what they said,' and I said 'I guessed he'd come if she thought he was pretty nice,' and he said 'Didn't he come?' and I said 'No, she wouldn't let him.'

"We were sitting there and some one called 'Josephine!' and I said 'What?' and 'twas Marian. And she said 'Oh, good afternoon, Mr. Kensington,' and he said 'Did you have a nice time at the beach?' and she said 'Yes, it was lovely there,' and he said 'I suppose you were sorry to come back,' and she said 'Yes,

we hated to leave dreadfully.' She sat down in the swing, but didn't swing, 'cept to teeter it with her feet. And he said 'It seems an age since I've seen you,' and she didn't say anything, but just teetered, and he said 'It seemed as if there wasn't anybody left in town,' and she said 'Why, I didn't know Mattie had been away,' and he said 'She hasn't, that I know of.'

"They talked a lot, and she laughed some, and he did; and that evening he came up on the piazza, and he said 'Wouldn't I let him be my beau again?' and I said 'I don't care,' and I sat on his lap. And he said 'You won't ever jar me again, will you?' and I said 'What?' and he said 'You won't ever jolt me again, will you?' and Marian laughed.

"He came the next night, too, and I sat on his lap till Winnie came, and then we went over to her house to have some ice cream they'd had for supper, and when I came back 'twas dark, and I walked on the grass, and they didn't hear me, and I said 'Boo!' and she jumped off his lap.

"The next morning when I was swinging that way he jumped the fence, and she came down just then and she said 'Kenneth isn't your beau now; he's mine,' and I said 'He isn't; he's mine,' and he said 'Won't it do just as well. Josephine, if I'll be your brother?' and I said 'I don't care'; and he swung me real high, and my foot just touched the branch."

## From Goethe

BY MARY E. KNEVALS

THE heart two chambers hath  
Of joy and sorrow,  
The heart two songs doth sing  
Today—tomorrow.  
The heart two things doth weep  
And weeps them ever,  
Love that is gone, and love  
That cometh never.

## Fenwick's Career

*Fenwick's Career*\* is another illustration of the fact that Mrs. Humphry Ward's method as an historical novelist differs radically from that of other writers in this class. And some speculations as to the reason for this difference will be of interest to her readers.

We have all noticed that she never descends to the *gaucherie* of heroism. It is an ostentatious manifestation of life which does not appeal to an author who shows remarkable delicacy of mind and sensibility, but whose well breeding has bereaved her of the heroic instinct. For this reason she chooses characters who have merely graced the pages of history, poets, artists and women famous for their beauty and social charms. And if by some chronological chance a great warrior or statesman finds his way into her story it is not in the spectacular *rôle* of turning the world upside down with a rebellion as a reform, but simply as a guest at a garden party. Nobody defers to him, because he has saved or sold his country. His deeds, like his valet, are kept in the background, and for the same reason. Neither the one nor the other is pertinent to the occasion. This is good form, but Mrs. Ward is the only living writer of fiction who prefers good form to heroics.

But that which distinguishes her still further is the *eclectic* use she makes of historical details. The average author is thankful if he is able to draw his hero faithful to one character in history, but Mrs. Ward's hero may be a composite of a number of men known to fame. Thus the character of Fenwick in this new novel is supposed to be interpreted from George Romney, the popular English painter. He is an artist with Romney's temperament, genius and limitations. He had the gypsy look and the "fine, quarrelsome eye," which we have been accustomed to associate with the likeness of Romney. Fenwick also leaves his wife, becomes a famous portrait painter in London, and only returned to her as

Romney did after many years, a broken and miserable wreck. But there are incidents in Fenwick's career which are apparently taken from the life of Gainsborough, who was a contemporary artist. Meanwhile, Millet, who was not born until twelve years after the English painter's death, is referred to as if he were already an historical personage. And when Fenwick is at last overcome by misfortunes he is made to compare his own fate with that of the unhappy artist, Haydon, who did not commit suicide until forty-four years after the death of Romney. And Madame de Pastourelles, who is represented as the inspirer of all that was best in Fenwick's art, does not resemble the notorious Lady Hamilton, who made and ruined Romney.

However, Mrs. Ward explains in a prefatory word that the story "owes something to the past in its picturing of the present." This is the final chronological miracle of the book. With all of eighteenth century English art for a background, the whole conception is modernized by the heroine. She is the star which shines from the present upon the past. And she is herself an illustration of the modern eclectic femininity, with which Mrs. Ward's readers are already familiar. Madame de Pastourelles is not only refined; she is superfined by a long line of selection. Her very bones are ivory, her skin pearl, her spirit a sort of immortal violin with the tones of time and the poetry of a thousand ancestors in its strings. No impression is received of the existence of flesh and blood between Madame de Pastourelles's skin and bones and spirit, but by this time we know better than to expect that grossness in Mrs. Ward's heroines. They are too thin for anything except poetry. And she deserves great credit for bringing this last one to the end of the story without a collapse. Such women are predisposed to neurasthenia, and in all her other stories they have come down with a consumption or some other illogical complaint.

Many readers will not recognize the

\* FENWICK'S CAREER. By Mrs. Humphry Ward. New York: Harper Bros. \$1.50.

ever recurrent likenesses of four great English painters in the characters of the book, but they will find interest enough in the way the author portrays the old tragedy of love lost out of marriage by a change of environment and ambition for the man which the wife could not share. Fenwick was annoyed by the peasant traits in Phœbe's character after his life in London and his association with Madame de Pastourelles, not because he had developed so much intellectually, but because his sensibilities had been refined. He had a different taste in love to satisfy. And the unhappy wife hastened the end by foreseeing the death of love. This prophetic power in a certain primitive, gentle, helpless type of woman indicate their telepathy for unhappiness. Their "good stars" do not agree, and nothing is to be made of them in life or literature but elegies.

A feature not to be ignored in the books is the grace and correctness with which Mrs. Ward draws distinctions between the personalities and works of Romney and Reynolds thru her interpretations of Fenwick and Welby. Without the pedantry of technical terms she produced the effect of great pictures in words. She dramatizes the very genius of her painters, so that we see the heart and temper of Fenwick in the colors upon his canvas.

If there is any fault to be found with the book it is the emphasis which the author places upon refinement, sensibility and the society which these elements create. Strength is better than refinement, because it always implies virtue, and the latter may imply decadence. Power is more than sensibility with all its gaucheries, and the common brotherhood of man is a nobler thing than the best society can ever be in its most elegant mood, because we have passed beyond mere exclusiveness.

### The Apostle Paul

THE years in which we are living will probably be looked back upon as a period of great productiveness in that sort of theological literature that applies itself to popular presentation of the results of research. In Germany a new generation of scholar-authors is coming to the fore,

who not only know their subject, but know also how to write. What is dead and heavier than a Meyer's Commentary translated into dull English and bound in black cloth? But Weizsäcker and Jülicher, and specially younger men like Wernle, Bousset, von Dobschütz and Wrede, are as interesting as the great historians, and at times as thrilling. They write like civilized beings with ideas to express, like pioneers in a new science whose discoveries enlarge knowledge and enrich life.

Heinrich Weinel, professor at Jena, whose work on Paul is promptly translated,<sup>1</sup> is not the least of these German theologians who are learned in life and literature as well as in their own department. One feels in him the poet and artist, the orator and preacher, not warping his historical judgment, but supplying the imagination and insight necessary to make old days of struggle live again and enabling him to tell their story with eloquence and vital interest. His subject is Paul the man, and his work in the early formative days of the Christian religion. He does not discuss the dates and authorship of the letters, but uses them all save Ephesians and the Pastorals. Nor does he tell the story of the travels and missionary journeys. He writes rather of Paul the Pharisee and the seeker after God, Paul the prophet of a new humanity and new method of fellowship with God, Paul the founder of the Church and the first Christian theologian. The personality of the great Apostle, both his limitations and his excellencies and his service to Christianity, stand out clearly upon these pages, and which he took over into his Christianity, and also the essential, vital message of the Christian Apostle, than is found in this treatise. It was written for laymen, being one of a series of *Lebensfragen*, vital questions, but it is a work of careful thought and thoro scholarship. It is hard to see how one can read such an examination of Paul's thought and mission without a twofold conviction; first the reader is won to fresh admiration of Paul and clearer understanding of conditions in the Apostolic Church.

<sup>1</sup> ST. PAUL: THE MAN AND HIS WORK. By H. Weinel. Translated by the Rev. G. A. Bienemann, M.A., and edited by the Rev. W. D. Morrison, LL.D. New York: G. P. Putnam's Sons. \$2.50.

Laying down this appreciative, sympathetic study of Professor Weinel, one's chiefest feeling is that the greatness of the man of Tarsus has not yet been appreciated. Except in the one respect of his heroism as a missionary the Church has by no means done justice to him. She has constructed theologies out of notions he held in common with the rabbis of his time, or out of his occasional replies to Judaizing opponents when he argued with Jews from Jewish pre-suppositions, while his really Christian message, his free religion of the spirit, has been left uninterpreted. For this Paul himself is partly to blame. He was a most inconsistent Apostle. For surely one can say these things of Paul as he said the like of Peter. He wrote the most beautiful poem of love in all literature, and he also advised people not to marry. He said at one time that it did not matter to him if others preached Christ differently than he, so be it Christ was preached, and at another time he said, if any man preach any other gospel, let him be anathema! Perhaps it is not strange that in the long years of the reign of authority in religion those features of Paul's teaching in which he had not emancipated himself from Pharisaism should have been chiefly regarded, while his message of the freedom of the individual soul before God has been largely overlooked. But Paul is not primarily a preacher of the doctrines of election and forensic justification, but of the liberty of faith, the freedom of the children of God. His great discovery was that the law, not merely Jewish law, but all law, is an obstacle and hindrance in the way to God. His abolition of legalism in religion was his great service to humanity, and the more one studies the difficulties of the problem as it was presented to him the greater is his sense of the greatness of Paul.

One would look far for a better presentation of Paul's "heritage of the school," current religious conceptions that we can by no means take over Paul bodily, all his ideas and opinions, as part of our present religious convictions, and secondly that in the religious needs of the present we have more to learn from the traveling Cilician tent maker than from any one else save the Master whom he served.

It is interesting to notice Weinel's opinion that the "celestial bodies" of the well known passage on the resurrection are stars, angel and star being often synonymous in contemporary Jewish literature; also that the reason for the veiling of women in public worship was lest they might seduce the angels, as in Genesis vi.

The translation says Paul "fought even unto blood for the glory of God." The author wrote *Mord*, murder (p. 64). Again we read that the cross was an offense "that wormed the very heart of the pious Jew," which is not English and does not render the German (p. 67). Other inaccuracies might be noted, but the translation on the whole is good and readable.

Of a very different sort is Canon Knowling's examination of the Pauline literature.<sup>2</sup> He has a brief for every traditional opinion and defends the authenticity and integrity and earliest possible date of every epistle imputed to Paul, save the letter to the Hebrews. He cannot consider mention of the evidences of gnosticism in the Pastoral Epistles as other than an "attack" upon them, and he speaks of reputable New Testament scholars as "opponents of the Epistle." He has studied recent German literature with astounding diligence, but he deals with opinions and authorities rather than the reasons back of the opinions, and shows entire lack of insight into the history of the Apostolic times.

**The Spur.** By G. B. Lancaster. New York: Doubleday, Page & Co. \$1.50.

The story begins in a shearing pen; and it ends in veiled horror. Australia and Samoa furnish many new types of men and strange studies of manners. *The Spur* is a strong novel, and holds the reader until the grewsome end. It fails of credence only because of a villain so extra-villainous that we simply cannot believe in him. If we yield ourselves to the spell of the swift, strong narrative, and keep our revolted common sense in leash, there is a grandeur in the hero, who "swareth to his own hurt and

<sup>2</sup> THE TESTIMONY OF ST. PAUL TO CHRIST, viewed in some of its aspects. By R. J. Knowling, D.D. New York: Imported by Charles Scribner's Sons. \$3.00.

changeth not." The struggle, however, has not the dignity of a hand to hand combat between right and wrong; it is between a man's sense of honor and his undoubted right to happiness; and his wife's claim upon him is set aside too cavalierly to be exactly credible. No man has a right to hold a wicked oath to an unscrupulous man above the sacred promise made to his wife. Granting the incredible, however, we have in *The Spur* a remarkable novel; not without a reminiscent flavor of Kipling, but with a wild fragrance of its own; and it is lived in a land new to most of us. England is most rich in colonial literature, and we add *The Spur* without hesitation to such books as "Kim," "On the Face of the Waters," "The Right of Way" and "The Story of an African Farm." The ear of the listening world will be turned attentively in the direction of Australia until the new voice speaks again.

**The Electoral System of the United States.** By J. Hampden Dougherty. New York: G. P. Putnam's Sons. \$2.

The conservatism of American constitutional law is nowhere more apparent than in the retention of the system of indirect election of the President. As Mr. Dougherty points out, this is the one feature in the Constitution in which the fathers departed from the path of experience, and sought to add a new device to the legal equipment of States. It is significant that precisely here their efforts were a melancholy failure. They believed that they were removing the election of President from the ignoble arena of party strife; as a fact, they created an institution which, after the lapse of a single decade, had become useless, when not positively dangerous. The electoral device alone makes possible the seating of a Presidential candidate who has not received a plurality of the popular vote, who is plainly not the choice of the people; and this is the objection to the system now most obvious. But the fatal ambiguity in the provision of the Constitution relative to the part of Congress in counting the electoral vote is what has already brought the country to the verge of civil war, and which remains, in spite of all Congress can do in

the way of legislation, a menace to the internal peace of the nation. Mr. Dougherty's book gives an admirable history of the Congressional controversies that have arisen over the electoral system, and of the legislation enacted to remedy its defects. Like most competent students of American political institutions, Mr. Dougherty favors the speedy abolition of the electoral system by constitutional amendment. The one adverse criticism that can be passed upon the book is that the author's rigid ideals of historical exposition have led him to employ such wealth of detail that only the trained scholar will be able to keep a clear notion of what is essential in the work.

**The Native Ministry of New Hampshire.**

By Rev. N. F. Carter. 8vo. Pp., 1021. Concord, N. H.: Rumford Printing Company.

An enormous amount of dry work must have gone into the composition of this portly volume. It attempts to give the name and record of all known clergymen born in New Hampshire, a State which has been rich in this product. There are 2,509 names included, all arranged alphabetically by the towns of their birth, and all denominations included. This gives an average of less than half a page to each, in which is given as briefly as possible his parentage, education, settlements, marriage, publications and death. The number of ministers born in small towns is surprising; thus 21 in Acworth, 19 in Bethlehem, 27 in Claremont and 36 in Hollis. The larger cities do not have their full share, for Manchester claims only 26; but Concord does fairly well with 48 and Portsmouth better with 66. The very full indexes are an admirable feature; and the volume is of value for New Hampshire libraries and scholars of local and genealogical history.

**The New Earth.** A Recital of the Triumphs of Modern Agriculture in America. By W. S. Harwood. New York: The Macmillan Company. \$1.75.

The improvements in agricultural methods being affected by the national Department of Agriculture and the Experiment Stations are adding more to the commonwealth than the discovery of

gold in California or of diamonds in South Africa, yet they attract very little popular attention. This is partly because the results of this progress are hidden in public documents, to be obtained free, and therefore considered not worth reading, and partly because the literature is more or less technical and very much scattered. Mr. Harwood has, therefore, done a great service in bringing together these results of the new agriculture and describing the methods by which they are obtained in a way to interest any reader. The making of new soil, the creation of new plants, the change of composition of grain, the testing of milk, the preservation of forests, the analysis of foods, the marketing of products, and the education of agriculturists are discussed in a clear and comprehensive manner, and illustrated by photographs. The book should be at once put into all the country libraries, especially in the traveling libraries.

### Literary Notes

....*Josephus's Complete Works* in a single volume for \$2, annotated, indexed and introduced, is one of the remarkably cheap editions of the classics imported by E. P. Dutton & Co., New York.

....Vols. V. and VI. of the *Journals of the Continental Congress*, edited by Worthington C. Ford, of the Division of Manuscripts, and published by the Government, brings the record down to the end of the year 1776.

....The fourth volume of the *History of the Parish of Trinity Church*, New York, edited by the Rev. Morgan Dix, has just come from the press of G. P. Putnam's Sons. It is a large, handsomely printed and illustrated volume, and carries the history to the close of the rectorship of Dr. Berrian.

....In our vacation issue of last week the photograph entitled "When the Frost is on the Punkin," was erroneously credited to W. H. Woods, of Baltimore, Md. Credit for this photograph properly belongs to Dr. A. J. Olmstead, of Belle Plaine, Ia. Credit for the photograph entitled "Spring Plowing in Syria" properly belongs to Harold H. Nelson, Instructor in the Syrian Protestant College at Beirut, instead of his father, A. H. Nelson, of Chicago, Ill.

....Everybody knows how inadequate and inconvenient our ordinary atlases are for the business man who wants to trace on the map the routes of the commerce of today, but is not interested in the march of the Crusaders, nor in the pilgrimages to Mecca. A new atlas which will admirably fill this want is *Newnes' Atlas of the World's Commerce*, now being issued in parts at 25 cents each by Fred-

erick Warne & Co., New York. It should be purchased, not only by business colleges, but by public and high school libraries to supplement their political and historical geographies. The average merchant, too, even if not an importer, will have his eyes opened to many trade opportunities by looking over its pages. For example, here is a map of the world on which all the coffee producing localities, a few small spots, are printed in red, and the coffee consuming countries are in blue, with lines of export connecting the two. Like all of Bartholomew's atlases, the maps and diagrams, a thousand in all, are very neatly and clearly drawn and tinted, not like the botchy work generally done in this country.

### Pebbles

ANARCHIST Emma Goldman has married Anarchist Alexander Berkman. They will be at home after June 15 at Chaos-on-the-Blink. —*Puck*.

WHEN the men angels get together in heaven and tell each other what they hated most on earth, they will say: "Having our engagements announced." —*Atchison Globe*.

MARY had a little lamb,  
And when she saw it sicken,  
She shipped it off to Packingtown,  
And now it's labeled chicken.

—*The Evening Post*.

AMERICAN GIRL (at Windsor Castle)—  
"Porter, is there any chance to get a glimpse of Queen Alexandra?"

Gentleman at the Gate—"I am not the porter. I am the Prince of Wales."

American Girl—"How lucky I am! Is your mother in?" —*The Royal Gazette*.

A NEW editor has taken hold of the *Triplett* (Mo.) *Tribune*. His salutatory to his new readers is this: "Some newspaper men are expert hot air gunners, and when they make their debut in a town turn loose the Vesuvius batteries, shelling the community with dream pellets. We come here without a plumed circus band, heading a glittering, gold-bespangled parade, with an ear-splitting whistle in the rear, but with fifteen years' experience in country newspaper work, a fairly clean laundry character and an ambition to make a respectable living."

MRS. LYSANDER JOHN APPLETON writes the *Globe* that she is thoroughly in sympathy with Upton Sinclair, author of "The Jungle," a book which "exposed" the methods in the packing houses. She says that recently she opened a can of corned beef and found that it contained a man's toe which hadn't even been chopped up to disguise it, and that she found two fingers in a can of pressed chicken. Mrs. Appleton did not make her discoveries public at the time because she had company in the house for supper and had to use the canned goods for that meal. She has so often found horn in deviled ham that she regards it as proof of the Scriptural theory that the devil has horns. —*Atchison Globe*.

# Editorials

## The Evolution of Public Opinion

ALL signs indicate that we are rapidly developing a true public opinion in the United States. On four or five great questions of popular interest at the present moment there may be said to be a public opinion of national scope. There is a public opinion which demands a national control of railway rates and management. There is a public opinion which demands the abolition of legal privilege to favored and powerful classes. There is a public opinion which demands that such infamous conditions as those that have been revealed in the meat packing industry shall cease, and there is a public opinion which calls loudly for honesty and straightforward dealing in business affairs.

Public opinion is a different thing from mere public feeling, whether taking the form of overwrought emotion or of easy-going sentimentality. It is a different thing from a prevailing belief. Public opinion is compounded of knowledge, discrimination and judgment. It is a product of intellectual activity. It is created by investigation, discussion and a critical review of a situation. It is a net result of a collective "getting at the facts" and a collective thinking about them in a calm-tempered way.

There is no such thing as public opinion, therefore, apart from an immense amount of activity on the part of men who are interested in finding out just what is going on, or apart from a widespread publication of results. So long as people who are dissatisfied or aggrieved merely react impulsively upon their wrongs, giving vent to bad temper, but not taking the trouble to look into the causes of their ills, the public mind does not get beyond a state of useless anger. Energies are wasted in "kicking against the pricks." There has been a great deal of that sort of thing in American history, and there is still so much of it that we are in a measure disgraced by it. Lynching and mob violence are its worst expressions, and we have not yet outgrown these

manifestations of an unformed social consciousness.

It is a symptom of intellectual and moral vigor, therefore, when we see so much investigation and hear so much discussion of economic and moral conditions as we see and hear now on every hand. Congressional and legislative inquiries are supplemented by investigations conducted by associations and by individuals, while exposures are the most salable of literary products.

Yet we cannot congratulate ourselves that we are creating public opinion in the best way. There is too much waste of physical energy, too much stirring up of ill temper, too much distraction of thought from main issues, and too much loss of time in the process. And all this because we have no organs of public opinion that are really fitted for the task of informing the public mind and directing its thinking. The newspaper press is not conducted today primarily for the purpose of conveying information, or of honestly shaping public opinion. It is conducted for the purpose of making money and of protecting vested interests. The news is not told in a simple, trustworthy way merely as news. It is worked up into "stories" that the public finds "interesting reading." Editorial writers are not expected to write with an eye single to mere truth and the public welfare. They are expected to be well informed upon the financial and social connections of their proprietors, and not to make "breaks." It is not healthy for them to display zeal in moral crusades that might inconvenience the big advertisers. The magazines are as much interested in exaggerating certain aspects of wrong as the newspapers are in diverting attention from them. In short, mere information and strictly truthful comment upon it is not salable "copy."

Fortunately for the public, however, what is one newspaper's poison is another newspaper's meat. They are organs of different interests, and they tell a certain amount of truth about each other, and about each other's financial backers. The

newspaper that exposes the fake editions of its too enterprising rival promptly "gets it in the neck" on the score of its indecent advertising. Between them the public learns some things that it is well the public should know.

Real public opinion in the United States, then, is shaped out of information more or less involuntarily disclosed and more or less distorted. Yet, all in all, the information is year by year more complete and more accurate, and individual readers learn more shrewdly to get at the approximate truth by reading between the lines of the editorial discussions. Some substantial assistance they obtain from the more independently conducted weekly journals and local newspapers. These organs of public opinion were never better than today, and, on the whole, never were more influential. A majority of them represent "movements" or "causes" of one and another kind. Labor papers, single tax papers, socialist papers, tariff reform papers, temperance papers, woman's suffrage papers, and so on thru a long list of special organs, have in the aggregate millions of readers, who gather from these sources a great deal of material for thought, which is on the whole stronger intellectual meat than the great dailies and the picture-book magazines afford. The observer who should make the mistake of forecasting public opinion and political tendencies in the United States, without taking account of the influence of these special organs, would find himself far astray.

One of these days, like enough, a sufficient amount of ability, moral earnestness and patriotism will be put into the conduct of the great metropolitan newspapers to make them real organs of public opinion. The phenomenon will be interesting—if it happens.

## The Meat Scare and Its Results

A POPULAR "scare" like the present one is in itself of interest only to the student of the psychology of crowds. The practical man wants to know what there is in it and what can be done about it. So far the visible effects are a decrease in our foreign trade, a fall in the price of cattle, the discharge of stock yards employees, the whitewashing of

the walls of the packing-houses, and an increase in number of vegetarians. These are largely temporary. The meat trade will gradually pick up, many of those who have become converted to vegetarianism from fright will relapse, and the whitewash, physical and figurative, will wear off from the packing-house walls. In order to get some permanent benefits from the scare it is necessary to avoid exaggerating or condoning the faults disclosed.

The injury done to a good cause by exaggeration is illustrated by the meat scare of seven years ago, which was almost as great as this, but produced no important reformation. General Miles now comes to the front and says "I told you so," and wonders why the people take seriously the charges of a novelist and two unofficial investigators while they laughed at those made by the head of the army and his officers. We venture to say that it was largely General Miles's own fault that nothing was done. If he had confined himself to what he saw and knew, if he had said that bad beef was being supplied to the army, that the canned meat was tough and stringy and tasteless and dirty and old and spoiled in a tropical climate, it would have done some good, but when he made charges that were not only unwarranted and absurd, but easily proved to be so, he was so thoroly discredited that he has never since been able to regain his standing with the American people.

What he said was that the army was supplied with "embalmed beef under the pretense of an experiment." It must have required a great deal of ingenuity to have put so many mistakes into so few words. The word "embalmed" is a vulgar epithet like those used by vegetarians in their argumentative moods. He meant, of course, that the meat had had some preservative added to it. An easy chemical test on the meat shipped to Cuba showed it was not preserved by chemicals. If it had been so treated it would have been better for the soldiers than to have it spoil as some of it did. The beef was not "embalmed"; if it had been it would not have been done as "an experiment;" if it had been an experiment it would not have been done under "the pretense of an experiment." Officers and

privates and camp followers outdid their leader, difficult as this was, in reckless statements in the newspapers. Some said that they could smell the boric acid or the salicylic acid at a distance of several feet; others that the meat tasted so strongly of these preservatives that it could not be eaten. Now, since every apprentice in a cross roads drug store knew that both these are entirely odorless and practically tasteless, it was no wonder that the truth they did tell was not believed. We now know that the diseases that carried off our soldiers by the thousand are not those caused by impure food, but by poor camp sanitation, due to the ignorance and inefficiency of our officers. The Manchurian armies, fed from the same packing-houses, which have not reformed, escaped such scandalous losses by disease.

There is at the present time a great deal of similar exaggeration and misconception in the papers and every effort should be made to prevent attention being distracted by it from the serious charges that have been made against the packers and clearly substantiated. Of those concerning the quality of the product, the most important are (1) the failure of the Government meat inspection to protect the American public from diseased meat, (2) the lack of honesty in the use of labels, and (3) uncleanness. The reform of these three definite delinquencies is perfectly practical, and public indignation should not relax until it is accomplished.

As for the first, the public must rely upon the competence and vigilance of the inspectors. There are many points about it on which doctors disagree. What diseases are conveyed by food and how much disease should require the rejection of a carcass are not yet completely determined. We do not even know for certain whether bovine and human tuberculosis are different forms of the same thing, and in how far they are mutually transmissible. It is not practicable to require that "only perfectly healthy animals" shall be used for food, as has been proposed, for perfect health is as non-existent among cattle as among men. But we can, with our present knowledge, insure that the grosser

and more dangerous diseases be excluded from the meat supply.

The second point, correct labeling, is a matter of common honesty, and enforceable without interfering with that promising and important line of discovery, the invention of new foods. There is no objection to imitation either, if frankly confessed. If the packer can fix up veal (not too juvenile) so it tastes as good as chicken and sells it at half the price we will buy it. He sells us "mock turtle soup" now under that name, so let him add to his list "mock chicken croquettes."

The third requirement, that of cleanliness, can only be obtained by publicity and eternal vigilance. It is a matter which can be efficiently regulated by the people alone. Neither legislators, inspectors, manufacturers nor workmen can be trusted. None of these have done their duty. Nor has the public. The packing houses have been the show places of Chicago for years, and the reception committee put them down as a matter of course upon the program of every distinguished visitor, prince or president. The worst rooms were not on exhibition, but much of the uncleanness specified in the recent "revelations" was known to hundreds of thousands of persons who have "done the stockyards." There was no need of inspectors, official or unofficial, to report how bad the packing plants smelt. Several million people knew it. That is the way they tell which way the wind blows in Chicago.

The people of New York have no excuse for turning up their noses at Chicago. They can see things just as bad any day in Fulton Market. Beef in the packing house is not more liable to catch disease germs as it is hung up in the open street, defiled by flies, brushed by the sleeves of the passersby, and dusted with the filth of the street by every gust of wind.

The public needs to be educated on the need of greater cleanliness in the handling of food in all stages, and when properly sensitive on the subject all that will be necessary will be to keep the packing-houses open as show places. Let the men and women feel that they are con-

stantly under inspection, then they will behave as properly as the white aproned man who makes candy or cooks butter-cakes in the plate glass window. One of the big New York hotels is gaining a great reputation by allowing visitors to look thru the kitchen and see how neat it is kept. Another as well known by name is being avoided, because it is whispered around that its kitchen is foul and cooks are careless. The packing-house is part of our kitchen, and we have a right to go thru it, all of it, at any time. It is the duty of the public to teach the packers the lesson that honesty and cleanliness is their best policy.

The packers deserve no mercy, since they did not have the usual excuse for the adulteration and falsification of food, namely, the necessity of imitating the evil practices of competitors. On the contrary, they have had a practical monopoly of the meat business, which they developed, and were able to control its conditions. They were rich enough, so they could have afforded to be honest and could have exercised benevolent impulses if they had had them. But they have used their power to rob the consumer on the one hand, the cattlemen on the other, and the railroads in between. They have encouraged the importation of excessive numbers of a low grade of foreigners of diverse nationalities in order to keep down wages and to prevent the formation of unions. Men and women who are fighting with each other at the Packingtown gates for a job are not in a situation to dicker for high wages, and race prejudice is the strongest barrier against union. Yet upon these men and women their employers are laying the blame for slovenliness which they have never tried to restrain.

The packers deserve high praise for having created one of the most important industries of modern times, for having applied the arts of the mechanic and chemist to the preparation, preservation and transportation of meat, and by this means raised the dietary standards of the civilized world, but in accepting the credit for this achievement they must also shoulder the blame for their unwarrantable abuse of their power in the unfair treatment of competitors and employees, and in forcing upon the market under

false pretenses dirty, diseased and mis-branded food.

## The Railroad Investigation

THIS investigation that has laid bare so much injustice and corruption in the Pennsylvania Railroad Company has, like the life insurance inquiry, suggested to the average disgusted and angry citizen the need of agencies that will reform and restrain. More jails, some in their haste will say, or more prosecutions and convictions to fill the jails we already have. Very well; all who deserve to be in jail should be placed there. But cannot this injustice and these offenses that excite so much indignation, that enrich some and ruin others, that make millionaires of a few at the expense of the many, be prevented in the future? All this evil was done in the darkness and secrecy of corporate seclusion. Would it have been done in the light of searching official supervision?

It is the lesson of all this exposure of muck that complete and enforced official publicity for the affairs of public service corporations is sorely needed and must be had. It is needed first for detection; when the doors are thrown open and kept open for detection, the result is prevention. A railroad officer will not violate the law by giving one shipper a rate lower than that which others are required to pay, if he knows that all his accounts and records and even his memoranda must be shown to official examiners, and that the people, by means of such examiners, are watching him.

Without full publicity there can rarely be detection. Favoritism in freight rates, altho clearly forbidden by law, was a general practice on great railways up to a few years ago. This is admitted by such officers as President Cassatt and Vice-President McCrea. We have it in their testimony and their statements to the public. But rarely could instances of this favoritism be found by public officers and exposed. There is no more important part of the pending Railroad Rate bill than those paragraphs compelling railroad companies to keep all their accounts, records and memoranda in prescribed forms, providing that the Commission and its examiners shall have ac-

cess to all these at any time, and punishing even by imprisonment the falsification of a record or the keeping of any except those which the law requires.

This means publicity. It is designed to prevent the upbuilding of one mine-owner at the expense of another's ruin, the destruction of one salt manufacturer's business for the enrichment of another salt manufacturer who happens to be the railway vice-president's brother, the giving of secret low rates to a great Trust or a great brewery or a combination of beef packers, and all the forms of forbidden and unlawful discrimination that our railway companies have wickedly practiced.

The companies' business must be open to the world, as it ought to be. It will cost something. There must be examiners and special agents and frequent inspections. Forty per cent. of the world's railway mileage, capitalized at thirteen billions and manned by more than a million employees, cannot be supervised and held strictly to the law for a small annual expenditure. But a square deal for everybody on the railroads of the United States will be worth all it costs. We believe it can be obtained, under conditions of private ownership, by legislation and executive action. Our people are going to have it in some way. If they become convinced that they cannot get it from the companies, they will run the roads themselves.

Publicity might have been in the past a defense for railway officers against the demands of powerful shippers, those demands which, some of these officers say, they could not resist. When some strong corporation or great Trust took a railway "by the throat," insisting upon rate discrimination in favor of itself and against all others, what would have happened if the railway and its officers had cried to the public for help? What would have been the effect if the railway company had said to the public: "This shipper demands an unlawful rate, threatening to give its business to some other less conscientious company if we refuse to break the law"? It seems never to have occurred to an intimidated railway company that protection and relief could be procured in this way. There is no record, we think, of a railroad seeking

thus to avoid cheating other shippers and violating the statute.

Nor did the great life insurance companies appeal to the people for help when, as some of their officers have asserted, their interests were menaced by the corrupt demands or "strike" bills of dishonest legislators. And yet there has been no time when such an appeal, with righteous denunciation of the scoundrelly legislator, would not have been effective, for example, in the State of New York. How long could any corrupt legislator at Albany, exposed with a "strike" bill in his hand, have withstood the wrath of the policy-holders and the public? But the insurance officers, for reasons highly discreditable to themselves, preferred to appease the enemy with yellow dog funds.

For the latest authoritative report as to the prevalence of rebating a few years ago we may look to passages in the statement given to the press last week by President Cassatt. The management of the Pennsylvania road, he said, had rendered an immense service to the public and to the cause of honesty in the transportation business when, "in the early part of the year 1900, two years before the passage of the Elkins Act, it gave notice that no more rebates would be paid, and that all shippers, great and small, would be placed upon a basis of perfect equality," thus "inaugurating a movement which, having been joined in by other railroads and aided later by the passage of the Elkins Act, had destroyed a vicious system almost as old as the railroads themselves, and which had become so deeply rooted that many experienced railroad men doubted the possibility of eradicating it."

Mr. Cassatt did stop the payment of rebates on his road in 1900, and he did this after community of ownership had eliminated, so far as the bituminous coal traffic and much other business was concerned, that competition which had been one cause of rebating. Recent testimony shows, however, that mine owners on his lines have still been subject to discrimination in other forms. What we desire especially to point out, however, is what appears to be an assumption on his part that rebating was not unlawful before the passage of the Elkins act, in 1902.

Full publicity as to the affairs of all the roads, with the criticism excited by it, would have convinced him, and the officers of all other companies, even in 1900, that rebating was unlawful and had been so by statute for thirteen years.

One paragraph in the pending Rate bill was designed to prevent the owning of coal mines by railroads after 1908. There are ways in which the purpose of the authors of the paragraph can lawfully be thwarted. This is unfortunate, for railroad companies should be confined to the transportation business. It may be that in 1909 the railway coal interests will be as large as they are at present.

In the public domain there are millions of acres of land which in all probability contain deposits of coal or oil. It is reported that Mr. Roosevelt desires to withhold these lands from entry, and to obtain legislation that will prevent the acquisition of them by private persons or corporations. He would have them retained by the Government in perpetuity, it is said, but would permit the leasing of them under restrictions. We await the confirmation of the report, which seems to point to an important result of the railroad and oil investigations. The Government should not part with the coal and oil lands which it now owns, nor should it permit the output of mines or of oil wells in them to be controlled by any monopolistic combination. If the President is striving to prevent the alienation of this great property, he deserves and will have the support of the American people in his undertaking.

### The Senate as a Court

THE Senate, like the House of Representatives, is primarily and chiefly a legislative body. But it has certain judicial duties. For example, in the case of the impeachment of the President or of a Federal judge, it acts as a court, in its judicial capacity. Of that there can be no doubt. Equally is its function judicial in its decision of the qualification of its own members; and the same is true for the House of Representatives. It is because people are confused in this matter that petitions have been sent, acres of them, to the Senate against the admission of Mr. Smoot.

For or against the enactment of a law petitions are in place; but they are utterly wrong and out of place when they are addressed to the Senate as a court. The Senate has no right to act on preference or bias, but simply on the existing law and Constitution in judging of the admission of its own members; for the question is purely one of qualification. The Constitution reads:

"Each House shall be the judge of the elections, returns and qualifications of its own members."

The Senate, then, must "judge"; it acts as judge. It may judge of three things—the elections, the returns, and the qualifications. These are all defined in the Constitution, which declares that the Senator "must be chosen by the legislature" of his State, or temporarily appointed by the Executive, which means "elections" and "returns"; that a Senator must have "attained to the age of thirty years," been "nine years a citizen of the United States," and shall be "an inhabitant of that State for which he shall be chosen," which means the "qualifications"; there are none others. But the Senate has another judicial function. It may "punish its members for disorderly behavior, and, with the concurrence of two-thirds, expel a member." To do this in any other way or spirit than judicially would be an outrage.

It is a confusion of thought to suppose that because the Senate is chiefly legislative, therefore its judicial action may be affected by petitions. Senator Hoar was right when he said of certain petitions against Mr. Smoot in 1903:

"It is as much out of place to address such petitions to this high court which is to determine those cases as it would be to petition the Supreme Court of the United States to take up some case which was before it or decide it in a particular way."

There is in the present case no parallel, such as has been asserted, with the petitions against slavery presented by John Quincy Adams. Those were addressed to the law-making power, urging enactment of laws, a very different case from the present.

Accordingly we join in no petitions to the Senate that it reject Mr. Smoot. All we are allowed to do is to express our personal opinion that we see no constitutionally valid ground for rejecting him.

He has been validly elected, validly returned, and he possesses the valid qualifications under the Constitution. He is the kind of man the people of Utah, a State in the Union, want. He is not "disorderly," for there is no pretense that he has broken any law such as a Senator from Kansas was guilty of, an offense which compelled him to resign so as to avoid expulsion. We have no liking for Mormonism or the Mormon Church, but we would not have Utah refused its chosen representative on the demand of men and women elsewhere, so long as Mr. Smoot possesses the constitutional qualifications.

The report against Mr. Smoot was adopted in committee by one majority, and the better lawyers with the minority. The majority would exclude him on no personal ground, but because he is one of the twelve Apostles who rule the Mormon Church, who have condoned polygamous relations, "and have brought about in said State a union of Church and State contrary to the constitution of the State of Utah, and contrary to the Constitution of the United States." Now there is nothing in the Constitution forbidding the union of Church and State in any State, and the only provision is this, that "no religious test shall ever be required as a qualification to any office or public trust under the United States." But that does not forbid the election of a Mormon as Senator, any more than of a Presbyterian or a Catholic. Indeed, the complaints made against the Mormon hierarchy are precisely those that are frequently made against the Catholic, and used to be made in Connecticut against the "standing order." We do not like to champion the Mormon Church, which we despise and detest as a monstrous delusion, but even Mormons have their political and constitutional rights.

✱

### The Cranky Remnant

WE hear of "the saving remnant," but there is also the cranky remnant. There are the scattered ones who have not bowed their knees to Baal: but there are also the lingering clingers that resist every prevailing reformation. Some will insist that "the sun do move," even after the world knows that it is the earth that

revolves. Their old way or belief is so good for them that they will have no better; and the good is always the enemy of the better. They hold so stoutly to the good in an old belief, or an old institution or organization, and especially to the noble history of its ancient good, that they cling to it after its power and promise of good have passed away.

It is impossible to expect that any reform will carry all the people. We must not wait for it. There were Tories in our Revolution, and there are Tories unconvertible in every revolution. Therefore we need not be surprised that there is a remnant that refuse to join in the union of the Cumberland Presbyterians with the mother Church. Just so there were "Wee Frees" left when the Free Church joined with the United Church of Scotland; and a big noise and fuss and mischief they made with their Gaelic crankiness.

But common sense joined with grace is better than grace stubbornly isolated, and is sure to prevail. The remonstrants dwindle away. The old ones die off, and their children have more sense with their grace. A diminishing fragment may continue for a generation or two, but they are surrounded and enveloped and finally absorbed. There is no reason to be surprised that the recalcitrant Cumberland churchmen object and resolve never to submit. They will submit; and those who still refuse will be left behind and out of sight, and will have no influence and be forgotten.

Of all arguments against Church union, the weakest is that it will create a new denomination, inasmuch as there will be a remnant left opposed in each of the two bodies. In the first place, there will usually be no recalcitrants in both bodies. There were none from the United Church of Scotland when it was merged with the Free Church. There were none from the Presbyterian Church when it received back the Cumberland Church. It is usually the smaller one which produces the implacables. Again, the remnant is a vanishing one. It has no vitality; it perishes. It need not be considered. Those that pull back must be pulled along or be left behind, in every great forward movement, whether social, political or religious.

There are several propositions for

union now before our Churches. They will find opponents. That is to be expected. Some men love to be in minorities. Some so love their peculiar ideal of perfection that they resist every color of compromise. Some are so cranky that a subsidiary feature which may be allowed to lose its prominence seems to them the chief essence of their ecclesiastical system, one which they cannot sacrifice or leave in the background. These people cannot all be mollified; they cannot rule; they have to be left to their own blessed isolation, which may be to the comfort of those from whom they withdraw. The larger fellowship is the compensation for their loss. Let them go in peace when they cannot stay in peace; but when they forbid the bans, let the ceremony proceed.

### New Zealand's Lost Leader

RICHARD SEDDON, Premier of New Zealand, who died on the other side of the world this week, was far and away the greatest figure of his day in Australasian politics, if not in all British colonial government. He entered public life in 1891 on the wave which swept the Progressive Party into power, and was chosen Minister of Public Works by the new leader, John Ballance. Upon the latter's death, in 1893, Mr. Seddon became Premier, holding that position continuously until his death. That one fact alone is significant when we recall that the average lifetime of New Zealand ministries had been less than two years, and the longest—that of Stafford—only five. It has been of inestimable value to that nation, because it has given it a chance for a continuous and rational development of certain experiments in democracy, in strong contrast to its neighbor, the Commonwealth of Australia, where there have been four different cabinets in as many years, and a condition of unrest which has led to many extravagancies.

The Progressive Party, which Mr. Seddon so long led, was not—and is not—a labor union party. It came into power fifteen years ago as the result of a united and democratic movement of wage earners, small farmers and business men, who wanted to develop New Zea-

land for the benefit of those who lived there, as against the clique then in control, which had come to regard it mainly as a sheep-pasture for gentleman living in England. It is this wide basis of support which has made the permanence of the party possible, and its reforms have been for the benefit of all and not a few of the people. There has always been an opposition, but never a third party of any consequence, and New Zealand has escaped the ridiculous and embarrassing plight in which the Commonwealth of Australia has been placed of having a minority control legislation thru "the balance of power."

During the fifteen years' sway of the Progressive Party the new New Zealand has grown up—grown from a nation whose financial solvency was questioned and whose resources were unknown, to one whose credit is recognized, altho it has vastly increased its debt, and which, in spite of its isolation, has become one of the markets of the world. It was as an organizer, leader and campaigner for this party that Mr. Seddon was great. Power and personality were his attributes. His talents were distinctively administrative. As an inventor of institutions he took no great part. The basis of New Zealand's radicalism was laid twenty years before his time in the public works policy of that erratic but brilliant statesman of fortune, Sir Julius Vogel. The campaign for widening the franchise was made later by Sir George Grey, while the land reforms were planned and begun by Ballance and Sir John McKenzie. The arbitration court—the most widely discussed of all New Zealand's institutions—was not the creation of Seddon, but of his then Minister of Labor, William Pember Reeves.

But as the head of his party—a robust and picturesque figure—Premier Seddon had no rival. A man of great physical size, he had energy to match, and an infinite capacity for detail. He was a gourmand for work, as the fact that he was his own Colonial Treasurer, Minister of Defense, Minister of Labor, Minister of Education and Minister of Immigration shows.

Mr. Seddon laid himself open to ridicule by his vanity and conceit, altho these sprang from the same source which gave

him his immense confidence and courage. This tendency injured his popularity in later years. "Our Dick" became "King Dick," and the Westland miner was overshadowed by the Right Honorable Richard John Seddon, P. C. and LL.D. Mr. Seddon's methods were not always scrupulous, and he did not hesitate, when necessary, to use the "mailed hand" in controlling even his own party. But his independence and incorruptibility were never questioned, and altho personal ambition may have been a more compelling motive with him than unselfish devotion, the method he took to advance Richard Seddon was to advance the country over whose destinies Richard Seddon presided.

It is doubtful if the reign of the Progressive Party will long survive its lost leader. In fact, division in the ranks began a couple of years ago in the launching of a third party devoted to labor union interests. Sir Joseph Ward will probably be the next Premier—but there is no other Richard Seddon.

#### Bryan the Conservative

From his journey about the world, in which he has conducted himself with all dignity and propriety, and where he has doubtless learned much which will fit him for as high a station as he has twice aspired to, Mr. Bryan will return in the early autumn, ready to lead his party. For that seems already settled by the concurrent voices of Democrats of various States. Whom else should they rally to that they may escape the yellow talons of the "griffin Hearst," who hovers over all our central cities, spreading radical confusion? So Bryan is now lauded as the conservative statesman, the opposite of Hearst, the antithesis of Roosevelt. It is curious to see, in six years, the old heresies buried, and no less pleasant. The world, and the Democratic party, and its perennial candidates, do learn and improve. Let the Republican party look out. There will be revolt if it refuses to reform the tariff, and blunders on the Philippines and other matters. And Bryan returns from his conquest of the world, a hajji of many shrines, and bearing a new title of Datto—Datto of Nebraska, we suppose it will be—conferred upon him by the grateful Sultanate of

Jolo or Mindanao. Henceforth he ranks with other 'scutcheoned grandees of high fame and strange name—the Padishah of Persia, the Ameer of Afghanistan, the Tycoon of Nippon, the Inca of Peru, the Maharajah of Mysore, the Sirdar of Egypt, the Khalifa of Sudan, the Mahdi of Khartum, the Negus of Amhara, the Dey of Algiers, the Imaum of Islam, the Seyyid of Zanzibar, the Sultan of Johol, the Vali of Janina, the Mutaserif of Ismid, the Kaimakam of El-Jûf, the Muhafza of Suakin, the Sachem of Tammany, the Than Thai of Anam, the Khan of Kalat, the Tetrarch of Abilene, the Grand Mogul of Delhi, the Gaekwar of Baroda, the Scindia of Gwalior, the Kazi of Sikkim, the Nawaub of Mysore, and the Akhond of Swat. Shall we give him the title higher than any of these, of President of the United States, for his nominations have already begun to pour in from East and West?

#### Railroad Favors

We stated last week that more than a dozen years ago—say fifteen—when exactly the present condition of things in regard to coal and coke companies was called to the attention of Mr. Thaw, he made it hot in the meeting of the directors of the Pennsylvania Railroad Company, and, as we are informed, a resolution was passed prohibiting officers and employees having business relations with or interests in companies with which the railroad did business. We suggested that this be looked up. This statement has received a certain corroboration from testimony since given before the Interstate Commerce Commission. A letter was produced written June 13, 1894, by the late Frank Thomson, then president of the Pennsylvania Railroad, advising J. McLennan, of Blairsville, Pa., not to take a block of stock offered to him by a mining company. Mr. McLennan reports Mr. Thomson as having told him that "the rules of the company, as well as my own honor, were against the acceptance of the stock." Those "rules of the company" must have been what we referred to, and they disprove the claim that it was the policy of previous administrations to accept interests in coal companies to be developed. We understand that Mr. Patton, who has been so active in religious matters and is

very high in the councils of the Young Men's Christian Association, defends his course, and declares that nothing he has done has been to the loss of the Pennsylvania Railroad, whose interests he serves as assistant in Philadelphia of President Cassatt. His brother, we believe, has much to do with the allotment of cars. Mr. Robert Pitcairn, who has lately resigned his office as assistant to President Cassatt, at Pittsburg, who was accused of having received \$5,000 in stock of a coal company and then accepting a check of \$5,000 in exchange for the stock, and who refused to appear before the Commission unless he was subpoenaed, and to whom the Commission sent the reply that if he preferred to let the case stand as it was they were satisfied, as they had sufficient evidence—has been, we understand, for twenty years elder in the Shady Side Presbyterian Church of Pittsburg (644 members) and superintendent of its Sunday school. He doubtless sees no wrong in what he has done.

**A Cathedral** The dedication of the Christian Science Cathedral, in Boston, is an event in American architecture and American delusion. It is fortunate that something good, and so fine and good as this building is, can come out of so empty a delusion. Beyond question, this new church, costing \$2,000,000, and all paid for, is the most magnificent ecclesiastical structure in Boston, and surely one of the finest buildings in the country. It will last after the delusion dies, just as the pyramids last, and the Pantheon. The interesting question is, How does it happen that a delusion can find so many victims? It is not sufficient to say that it claims to meet common wants for help and comfort, bodily wants in sickness; for we ought to be able to judge whether such claims are justified by fact. The best bottom explanation is, that the credulous believers generally lack right education. They may have a certain sort of education, but not the right kind. Great learning in literature or languages or political history will not help, nor deep study in cryptic philosophies. What is needed is study in evidence, such as comes thru physical and biological science. Let one learn to understand, by work in laboratories, which

show the relation between effects and causes, and he will be slow to trust to imagination, or to be deceived by sounding mysteries. That Mrs. Eddy is a fraud seems to have been abundantly proved. Her claims and her books are intolerable nonsense; but the class of otherwise sensible people that accept them form a study in mental hallucination, and prove that Carlyle's millions "south of the Tweed" have large representatives in this country, "mostly" Ed-dyites.

**A Co-operative Scheme** Our readers understand that we do not pretend to endorse the views of our contributors. We publish articles worth reading, worth considering, with which we do not agree. This may be remembered in reading an interesting article in this issue by Mr. Upton Sinclair. He confesses himself to be a Socialist; we only believe that there are certain monopolistic industries which the city, State or nation should own and manage. We do not advocate the socializing of all industries. Mr. Sinclair wants to know if a hundred families will join with him near New York in a co-operative scheme of living and training their children. The experiment is a fair one, and something like it has often been made, not with the most successful results. Mr. Sinclair might have advertised (and paid the bill) for his associates; we charged him nothing but pay him for advertising. It is an interesting scheme; try it if you will, but do not hold us responsible for the result.

This week and next Wilberforce University celebrates its fiftieth anniversary with great eclat. It is the oldest, we believe, and the most advanced of all the colleges entirely under the management and instruction of colored men. Both Senators and the senior Congressman of Ohio will speak, and various presidents of Ohio colleges and bishops of the African M. E. Church. Wilberforce gives its name to its town. It has a college course, whose classical students read Aristophanes and Pindar, and whose scientific students have differential calculus; a divinity school, and the necessary preparatory and normal and the popular business and industrial departments.

# Insurance

## The Fourth of July Hazard

On July 4th, 1776, the United States declared its independence and established a form of government which ranks today among the world Powers, and has to be reckoned with internationally. Since the day and year mentioned it has grown into a custom—not altogether confined to juveniles—to mark the day we celebrate with the ringing of bells, the blowing of horns, the discharge of cannon, the firing of guns and pistols, the sending up of rockets, the burning of red lights, roman candles, pin wheels, chasers and other creations of the pyrotechnic art, as well as by the explosion of various kinds of cannon and other firecrackers. This rekindles the fires of patriotism that have been extinguished in part during the time which intervenes between the July 4th of one year and the July 4th of the following year. It amuses the youth and keeps alive the interest in the so called "Independence Day" on the part of adults. The Fourth of July, as we celebrate it, is absolutely and uniquely American. In the production of ear splitting noise on July 4th, however, we approach the achievements of savages in their beatings of tomtoms as the expression of their pleasurable excitement. This of itself would not be so very bad if we do not consider the sick and the nervous, to whom quiet is often a priceless jewel. Unfortunately, however, mere noise is not all. The fire damage and mortality directly traceable to the popular custom now prevailing of celebrating the Fourth of July has in recent years grown largely, and many persons are annually killed, others are injured, and large losses result because of fires due to the "fire-works" method of celebrating American independence.

When it appears, from statistics gathered by the Chicago *Tribune*, that over fifty persons were killed and more than 3,100 were injured, as the result of last year's celebration of the glorious Fourth, notwithstanding the constant cheapening of human life, it really seems as if it was about time to call a halt, even if the property loss of over a quarter of a million dollars be entirely disregarded. Last year Wis-

consin enacted a law prohibiting the sale and use of giant firecrackers, which was a manifestation of the trend of public opinion against the time-honored method of celebrating, and in favor of an observance of the day that is "safer and saner." Wisconsin's example has been followed this year by the State of Iowa, and in that State it will henceforth be a misdemeanor punishable by imprisonment or fine to fire off revolvers, toy guns or firecrackers on the Fourth of July. The protest of the Iowa youth against this law will find as a foil thereto the approval of the fire insurance interests, which have millions of dollars at stake in that commonwealth. The old time celebration of July 4th is trembling on the brink of discontinuance. When the examples of Wisconsin and Iowa have been followed in the other States of the Union and it is possible to enjoy a quiet Independence Day it will be a continual source of wonder why we did not sooner come to abolishing the barbarous method of celebration that has too long prevailed. The passing of the old time Fourth of July is coming. It may not pass as quickly as did the catching of wolves alive with his hands as proposed by John Abernathy, United States marshal of Guthrie, Oklahoma, as a Fourth of July celebration, which was interdicted by President Roosevelt, but it will pass. It ought to pass.

Dr. Walter R. Gillette and Robert C. Granniss, both of whom were vice presidents of the Mutual Life Insurance Company under Richard A. McCurdy, were indicted this week by the special Insurance Grand Jury. Against Dr. Gillette there are six counts, five for forgery and one for perjury. Two indictments lie against Mr. Granniss, one for forgery and one because of his alleged filing of a false report with the State Superintendent of Insurance at Albany. Bail for \$10,000 in the case of Gillette and \$5,000 in the case of Granniss was accepted, and both cases go over until September. A feature of the Grand Jury's presentment was the scathing manner in which reference was made therein to making scapegoats of the dead. Further action regarding the insurance investigation will not be taken before August.

## The Wabash at Pittsburg

On the 7th inst. the last spike was driven in the link connecting the Wabash Railroad at Pittsburg with the Carnegie steel mills and all the other large manufacturing plants of the Pittsburg district. Some years ago Mr. Carnegie entered into an agreement with the Gould interests, promising to give the Wabash system one-fourth of the Carnegie Steel Company's freight business whenever that system should be extended to Pittsburg. The coming of the Wabash was opposed, quite naturally, by the Pennsylvania Railroad Company, and the projected extension has been made only after much delay. At great cost the obstacles have been overcome. At the same time the Wabash is constructing short branches for the accommodation of old coal properties and the development of new ones. Some progress has recently been made toward the completion of its line to the coast at Baltimore. A very interesting chapter in the history of American railways and of railway finance ends with the completion of the Wabash's Pittsburg connection. Among the incidents in this chapter have been the controversy between the Pennsylvania and the Western Union Telegraph Company, the chopping down of the Western Union's poles on the Pennsylvania's lines, and certain features of the long decline of stock market values in 1904. Mr. Carnegie's freight traffic agreement will be carried out by the Steel Corporation.

## Trolley and Steam

It was recently announced that the negotiations of President Mellen, of the New York, New Haven and Hartford Railroad Company, for the purchase of the Rhode Island Securities Company, which controls the trolley system of Providence and neighboring towns, had come to nothing, his proposition having been declined by the owners of the property. President Mellen's railway system is strongly fortified against trolley competition in the territory between New York and Boston (except in that part of it which lies between Providence and Boston), by its control of the trolley lines of New Haven, Hartford, Springfield and

other cities, in all about 700 miles of electric road. By the acquisition of the Providence lines its defenses would have been made almost complete. We hear now, however, that a new electric road from Providence to Worcester is to be constructed, for freight as well as for passengers, and that it will enter Providence by agreement with the company owning that city's lines; also that a project for a thru electric line from Providence to Boston is in a very promising condition. The Massachusetts Commissioners have granted freight rights to trolley roads in Brockton and neighboring places, and there will be thru trolley freight service from Providence to Brockton by way of Taunton. Trolley competition with steam, especially in freight service, appears to be growing in this part of Southern New England, which promises to become quite interesting to those who are watching the development of electric transportation service.

NEW YORK'S new tax on stock transfers yielded to the State \$6,232,498 in the year ending on June 1st, which was the first year of the law.

....The surplus of the Union Trust Company of New York, of which Edward King is president, was not correctly given last week. The proper figures are \$7,926,618.64.

....The Middlesex Banking Company, of Middletown, Conn., of which Robert N. Jackson is president, will pay on presentation, with interest to date of payment, debentures due November 1st.

....One of the crop authorities estimates this year's increase of wheat acreage in the Canadian Northwest at 10 per cent.; and predicts that the crop of 1906 will be from 120,000,000 to 125,000,000 bushels.

....Dividends announced:

Interborough Rapid Transit Co.,  $2\frac{1}{4}$  per cent., payable July 2d.

Plaza Bank, 10 per cent., payable July 2d.

Interborough Rapid Transit Co. (Preferred), quarterly,  $1\frac{1}{4}$  per cent., payable July 2d.

Manhattan R'way Co., quarterly,  $1\frac{3}{4}$  per cent., payable July 2d.

Am. Can Co. (Preferred),  $1\frac{1}{4}$  per cent., payable July 2d.

N. Y. County Nat'l Bank, 25 per cent., payable July 2d.

VOL. LX

NEW YORK, THURSDAY, JUNE 21, 1906

No. 3003

## Survey of the World

### The Meat Inspection Controversy

A majority of the members of the House Committee on Agriculture, led by the chairman, Mr. Wadsworth, of New York, rejected the meat inspection bill passed by the Senate, and reported a substitute which the President regarded with much dissatisfaction. Mr. Wadsworth laid this substitute before the President, who, on the 14th, sent him a long letter of criticism. He had examined the bill very carefully, he said, and had obtained reports upon it from Mr. McCabe, Solicitor of the Department of Agriculture, and James B. Reynolds. He continued as follows:

"I am sorry to say the more closely I investigate your proposed substitute the worse I find it. Almost every change is one for the worse, so that it hardly seems necessary for me to enumerate them. Perhaps the amendment as you have now drafted it is not quite as bad as it was when you submitted it to me in the first instance, but it is very, very bad. There seems to be one point in which it is possible that the amendment is even worse than the original amendment, if, as seems likely, there is no provision for making plants accessible at all hours to the inspectors. In any event, I am sorry to have to say that this strikes me as an amendment which, no matter how unintentionally, is framed so as to minimize the chance of rooting out the evil in the packing business."

Doubtless, he added, it "suited the packers who object to a thoroughgoing inspection," but in the long run it would be a heavy blow to the honest stock raisers and the honest packer if these provisions, instead of the far better ones of the Senate bill, should be adopted. The substitute "would hamper in the most grossly improper fashion the Secretary of Agriculture in doing the work which you have appointed him to do," and

would prevent him from doing well and thoroly even so much of this work as could be done at all:

"If the bill should go through in the form that the majority of your committee proposes, it might be that I should sign it as working a certain slight improvement over the present law, but if so I should accompany it by a memorandum explicitly stating how grave the defects were, and I cannot even promise to sign it, because the provisions (about the courts, as well as about other matters) are so bad that, in my opinion, if they had been deliberately designed to prevent the remedying of the evils complained of they could not have been worse.

"It seems to me that the surest way to keep our foreign trade from us, and, indeed, our interstate trade likewise, in a thoroughly unsatisfactory condition, and to prevent its resuming the position which it formerly had, is to enact the law in the shape proposed in the amendments submitted to me by you."

### More Letters on the Subject

Mr. Wadsworth has represented for many years a district in the western part of the State of New York. He is a man of wealth, interested in the breeding of fine cattle. His son was elected last year Speaker of the New York Assembly, with the cordial approval, it was said, of the President. The chairman's prompt response to the President's letter began as follows:

"I received your letter last night. You are wrong, 'very, very wrong,' in your estimate of the committee's bill. It is as perfect a piece of legislation to carry into effect your own views on this question as was ever prepared by a committee of Congress. Every member of the committee is absolutely as honest and sincere as yourself in his desire to secure the passage of a rigid meat-inspection bill. They know the meaning of the English language. To show

you now unreliable the information is upon which you base your opinion of the bill, I call your attention to the following language in your letter:

"There is no provision for making the plants accessible at all hours to the inspectors."

"If you will turn to page 4 of the bill (copy enclosed), line 2, you will find the following words:

"And for the purposes of such examination and inspection, said inspectors shall have access at all times to every part of said establishment."

"Can the English language be made any plainer?"

He also pointed out that in another paragraph the substitute required inspection to be made "during the night time, as well as during the day time." The packers, he continued, insisted upon having a rigid inspection law passed, and had placed no obstacle in the committee's way. The worst that could be said of the "court review" clause was that it was perhaps unnecessary, because already covered by existing law:

"I have been always taught to honor the judiciary of my country. I have always been taught to respect the rights of its citizens, and to respect the rights of property, and I cannot believe that the mere repetition of a provision which guarantees to the citizen the privilege of an appeal to the courts of the land when he believes his property rights are threatened can be justly or properly objected to."

Having offered to remedy any provision that would prevent the accomplishment of the President's purpose, he quoted the President's remark, that certain parts of the substitute "could not have been worse if they had been deliberately designed to prevent the remedying of the evils complained of," and closed with these words:

"I regret that you, the President of the United States should feel justified, by innuendo, at least, in impugning the sincerity and the competency of a committee of the House of Representatives. You have no warrant for it."

On the same day the President replied in a letter longer than his first one. Having acknowledged that he was in error about night inspections (Senator Beveridge had misled him), he argued earnestly against the proposed court review clause, which, he said, in some cases represented an honest though wholly mistaken conviction, and in others a deliberate purpose to interfere with effective administration. It would make the Secretary's functions purely ministerial:

"When he declared a given slaughter-house

unsanitary or a given product unwholesome, acting on the judgment of the Government experts, you would put on the judge, who had no knowledge whatever of the conditions, the burden of stating whether or not the Secretary was right. In Chicago, for instance, you would make any judge whom the packers chose to designate, and not the experts of the Department of Agriculture, the man to decide on any question of any kind which the packers thought it worth while to dispute. You may possibly remember the recent judicial decision in Chicago in which the packers were concerned."

If the packers really wanted a rigid inspection law, he continued, they would insist upon the exclusion of this clause. If they and their friends had a deliberate design to prevent a remedying of the evils, this was exactly such a provision as they would support. By request of the Speaker he had talked with Mr. Adams, a member of the committee, and Mr. Adams had said he would accept the recommendations made by Mr. McCabe, Mr. Reynolds and himself. If these should be adopted, the bill would become as good as the one passed in the Senate. He cared not a whit for the language of the bill. "What I am concerned with is to have it accomplish the object I have in view—namely, a thorough and rigid, and not a sham, inspection." Mr. Adams, of whom the President spoke, was for several years Dairy and Food Commissioner of Wisconsin. In the absence of Mr. Wadsworth (who has gone home) he has been quite successful in smoothing the way for an acceptance of some of the President's recommendations. On Monday last it was announced that the President would consent to the payment of the cost of inspection by the Government, that the court review clause would be omitted, and that the new inspectors would be appointed under the competitive merit system. In the Wadsworth substitute it was provided that they should be appointed without regard to the civil service rules, altho the eligible lists have a sufficient number of qualified applicants. The changes noted above having been made, with some others which the President desired, the bill was passed in the House on the afternoon of the 19th, after a brief debate and without a division.—On the 16th, the Chicago packers were directed by the City Health Department to improve the sanitary condition of their plants. This action was

due to a recent official inspection, which confirmed many of the charges of the Neill-Reynolds report.

#### A New State

The long contest over the admission of the Territories ended on the 14th, when the conference report was unanimously adopted in the House. Some weeks' delay had been caused by controversy as to the election to be held in Arizona and New Mexico. The bill, as finally passed and approved, provides for the admission of Oklahoma and Indian Territory as one State, and authorizes Arizona and New Mexico to decide, at a general election in November, whether they will unite, and thus make another. If a majority in each Territory vote for union and Statehood, the new State will be formed. If a majority in either vote against union, nothing further will be done. The controversy was between those who desired that the decision should be made at an election of Territorial and other officers, and those who preferred that action should be taken at an election held for no other purpose. The latter were successful. At the election in November only the delegates to a Constitutional Convention will be chosen, but there will be no convention if one of the Territories shall vote against joint Statehood. It is expected that a majority of the people of Arizona will vote in the negative. On the 16th the bill was signed by the President, in the presence of the Territorial delegates and other persons. He wrote "Theodore" with a gold pen presented by the people of Arizona, and "Roosevelt" with a pen made of a quill from the wing of an Oklahoma eagle. He advised the two southern Territories to unite, saying that if they should decline to do so, they might not have another opportunity in fifteen years.—At a Republican legislative caucus in Delaware, on the 11th, Col. Henry A. DuPont was made the party's candidate for Senator, receiving 20 votes, while only 10 were given to J. Edward Addicks, whose long fight for this office now ends in defeat. On the following day Colonel Du Pont was elected for the term ending in 1911. The new Senator (now in Europe) is sixty-eight years old and the head of the well known gun-

powder works that bear his name. An alleged combination or Trust of the powder manufacturers has been the subject of discussion in Congress. Charges against these manufacturers have been published in the *Congressional Record*, and circulated by Robert S. Waddell, president of a powder company in Illinois, who asserts that the combination exists, that the controlling influence in it is that of the Du Ponts, and that, owing to a suppression of competition, the Government has been required to pay unreasonable prices for powder.—At Omaha, a Federal Grand Jury has indicted thirteen prominent cattlemen of Nebraska for land frauds. One of them is Bartlett Richards. More than 450,000 acres are said to be involved. Secretary Hitchcock has directed the attention of Attorney-General Moody to the sentence imposed by District Judge Riner, of Wyoming, in the case of Henry G. Weare, who pleaded guilty to an indictment for land frauds and the illegal fencing of 150,000 acres of Government land. This sentence was one day in jail and a fine of \$300. Mr. Moody is asked to inquire concerning a report that it was suggested or recommended by District Attorney Burke, the prosecutor.

#### Railroad Problems and Inquiries

It was understood that the Railroad Rate bill was sent back to the conference committee in order that the very stringent provision against passes might be modified in the interest of railroad employees, and that an effort to place the sleeping car companies under the supervision of the Commission as common carriers might be made. There has been no clear explanation why the sleeping car companies were dropped out of the bill at the first conference. It is now said that they will not be put back.—At the Commission's inquiry concerning railway coal interests, in Philadelphia last week, the main subject was the Berwind-White Coal Company and the traffic advantages alleged to have been enjoyed by it. When the books were produced they showed that the stockholders were the estate of Charles Berwind, Edward J. Berwind, John D. Berwind, Harry A. Berwind,

Thomas Fisher and Frederick McOwen. It was admitted that many cars intended for this company and the Keystone Company were ordered from the manufacturers by the Pennsylvania Railroad Company, which paid for them, and afterward settled with the two coal companies, which in this way got a special rate. In 1902, when many shippers were in vain asking for cars, the Pennsylvania withdrew hundreds of cars from its own service and sold them to the Berwind-White Company for its exclusive use. Counsel for this company endeavored to prove that the Pennsylvania's large business in coal for ocean steamships at New York had been procured and built up by E. J. Berwind. The Commission ascertained that the Chesapeake and Ohio is controlled by an Executive Committee of six, four of whom represent the Pennsylvania and the New York Central. President Newman and Director Twombly are the Central's members; the Pennsylvania's are Vice-Presidents Rea and Thayer. The latter company has four of the six members of the Baltimore and Ohio's Executive Committee, and two of the five who constitute the Executive Committee of the Norfolk and Western. President Cassatt and the other Presidents have been formally invited to appear before the Commission and make statements, if they care to do so, but they have not been subpoenaed. Any grant of immunity is thus avoided. It is reported that none of the Presidents will accept the invitation.—The Chicago packers having, on the 12th, been found guilty of accepting, in August last, from the Burlington road, rate concessions on export business from Kansas City, the Burlington has since been convicted, on four counts, of granting these concessions.

#### Panama Canal Questions

By a vote of 110 to 36, the House has expressed its preference for a lock canal. The Sundry Civil bill appropriates \$25,000,000 for canal work. Mr. Littauer offered an amendment providing that no part of this sum should be used in constructing a canal at the sea level, and in support of the amendment Mr. Burton reviewed the arguments in

favor of a canal with locks. Mr. Sullivan urged that the question should not so hastily be decided, saying that it deserved to be considered as a separate and distinct legislative proposition. But the amendment was adopted by a vote of 3 to 1. Several amendments offered by Democrats and designed to permit the Commission to purchase supplies at the lowest prices, even if in a foreign market, were rejected. Afterward, the joint resolution recently passed in the Senate, requiring the Commission to buy supplies produced or manufactured in this country, "unless the President shall deem the prices extortionate or unreasonable," was passed in the House by a vote of 129 to 82. Sixteen Republicans, a majority of them from Minnesota, Iowa, Nebraska, Missouri, Wisconsin and Kansas, voted with the Democrats in the negative. The Republican argument was that as the canal was to be built with the taxes of the American people, the American workingmen and manufacturers should have the benefits of the market for supplies. If American prices were high, it was said, this was due to high wages. On the other side it was said that the burden of cost upon the taxpayer should be made as light as possible. Mr. Williams remarked that the Republicans were not trying to protect labor, but the Trusts and the contributors to their campaign fund. A proposed amendment forbidding the Commission to buy domestic products except at export prices, when these are lower than prices for American consumers, was rejected upon a point of order.

#### The Philippine Islands

Macaro Sakay, chief of the ladrones in Luzon, surrendered last Sunday, coming to the constabulary headquarters in Manila. Sakay is an educated Filipino, who proclaimed himself president of "the Filipino Republic." Francis Carlon was vice-president. He also surrendered. Sakay, who has had several engagements with the constabulary and was twice reported to have been killed, remarked that fighting was uphill work and that there was nothing to be gained by opposing the Americans.—Lieutenant Edward C. Bolton, of the Seven-

teenth Infantry, and Benjamin Christian, superintendent of the Government farm at Malita, were murdered last week in southern Mindanao by Mungalayon, second chief of the Tagacolas, a Moro tribe. Bolton was Governor of the province of Davao. He had passed the night at the house of Mungalayon, and was accompanied by two of the murderer's brothers, acting as guides. Mungalayon is the leader of a band of 200 religious fanatics who have terrorized the coast of the province. Bolton had an excellent record and was seeking by persuasion to pacify these and other malcontents.—On the 12th the public schools thruout the islands were opened. About 500,000 children attended, altho there were accommodations for only 400,000. A new high school at Lucena (province of Tayabas) was dedicated by Governor Ide. Delegates sent by the people of Lucena urged him to expel three Capuchin monks, saying that the Government's promise that the friars should be withdrawn from the islands had not been kept.—From August to April 21st there were 4,093 cases of cholera and 3,114 deaths. The death rate was very high in Manila, where 252 persons died, altho the number of cases was only 283.—Aguinaldo emerges from his retirement to urge the suppression of gambling, saying this vice is one cause of the prevailing depression. Other native leaders unite with Americans in asking the Government to prohibit cock fighting.—In a report to Governor Ide, Executive Secretary Fergusson says it is difficult to procure properly qualified Americans for the insular civil service, or to keep them in the islands. He suggests that the right of transfer to the Federal service be granted, in order that competent men may be obtained for limited terms.

#### French Problems

The French Chamber of Deputies reassembled on June 12th and elected Henri Brisson President of the Chamber. The Ministry is now supported by a majority of 120, and has announced a program of progressive legislation. It feels itself strong enough to forgive its enemies of both the Right and the Left, and so will issue a proclamation of general amnesty

for the strikers and anarchists who have been imprisoned for rioting, and the Catholics who resorted to violence to prevent the taking of the inventories in the churches. The first reform undertaken will be the establishment of an old-age pension system, for workingmen. Later the question of an income tax will be brought forward. The Marxian Socialists will form a separate group in the Chamber and act independently of all other parties, taking no part in the Government, but voting for such measures as advance their cause. Both of the Socialist leaders—M. Jaurès and M. Guesde—made speeches to the Chamber explaining the future program of the party and the methods by which the social revolution may be effected in the near future.—The Catholic bishops, at their recent assembly, the first held independent of Government control for over a hundred years, are said to have adopted a conciliatory policy by a vote of 47 out of 82, but it is reported that the Pope, who has the matter now under advisement, will disapprove of this, and instruct them not to submit to the law of separation and not to form the associations, which, by the separation law, are to take charge of the church buildings.—The Supreme Court, which is now hearing the Dreyfus case, is expected to declare his innocence. It was shown in open court that the secret evidence which was brought before the Rennes court-martial consisted in part of documents forged by Government officials to secure his conviction, and in part of the testimony of bribed witnesses. Dreyfus now does not ask for damages, but for an official vindication and the restoration of his name to the list of officers of the French army.

#### Massacre of Jews at Bialystok

On June 14th an outbreak took place in Bialystok, in which several hundred Jews were murdered. The despatches from the scene of the disturbances, altho they are closely censored, indicate that the massacre rivaled those of Kishinef and Odessa in atrocity and extent. Bialystok is a manufacturing town of about 64,000 inhabitants, in the province of Grodno. More than

half the inhabitants are Jews, mostly employed in the woolen industry. There is evidence to show that the massacre was planned in advance by the local authorities, if not at St. Petersburg. The Jewish leaders heard of the plot and appealed to the Governor for protection, but this was refused. The first news that was sent out from the town was an official telegram, stating that the Jews had thrown a bomb into a religious procession and that two priests and several children had been blown to pieces. Under the Czar's edict of toleration, the Catholics for the first time since 1863 were permitted open celebrations, and on Corpus Christi day the street processions of both Catholics and Orthodox took place. But the Governor-General of Grodno, when he arrived, contradicted the official report, and telegraphed to St. Petersburg that the Jews did not start the trouble and that the processions were not attacked at all. It was probably instigated by the police in revenge for the assassination of Chief of Police Derkacheff, a deed that was laid to the Bund, the Jewish Socialist society. At any rate, the police and soldiers made no effort at first to stop the massacre, but, on the contrary, fired into the Jewish houses and shot men, women and children in the streets. Police Superintendent Sheremetieff, who was responsible for the massacre, has been promoted and transferred. The mob was well organized, and pursued their work of sacking all of the Jewish shops on the seven principal business streets, carrying away or destroying the goods and setting the buildings on fire, while the police and firemen watched them without interfering. They then invaded the houses and killed whole families, regardless of age or sex, with the greatest brutality. A sickening feature was the indescribable mutilation to which many of the bodies of the Jews were subjected. Some had evidently been tortured by being burned alive, or having nails driven into their eyes, or being chopped to pieces by hatchets. The mob took possession of the railway stations and Jews found on the train were taken off and murdered. Several thousand Jews escaped by taking refuge in the forest during the three days of rioting. Members of the Bund, who had obtained arms, fought their assail-

ants by firing into the streets from the roofs of buildings, but no effective resistance was made. Houses marked with crosses chalked on the door or with ikons in front were spared by the mob. The peasants, inflamed by the false official reports of the attack by the Jews on the procession, came into the city in large numbers and assisted in the killing and burning. Similar outbreaks are expected in other Russian cities.

#### The Duma and the People

The members of the Duma are becoming more and more infuriated against the Government as they find their efforts to do something in behalf of the people checked and treated with contempt by the bureaucracy. The latest insult levied at the Duma by the Government is a demand from the Public Prosecutor that the Duma suspend one of its members, the Socialist Deputy Ulianoff, in order that he may be tried for publishing seditious matter in his paper. It is announced that thirteen other members of the Duma will be prosecuted for similar offences. While the Duma is in session the members are immune from arrest. The demand for the suspension of Ulianoff was indignantly refused. General Pavloff, who was called before the Duma to answer for the execution of eight men executed at Riga for supposed complicity in the revolt, made a brief statement to the effect that the executions were carried out under military law and that neither the Duma nor the Minister of War had power to interfere with the decisions of the courts-martial. The General immediately left the hall, followed by shouts of "Murderer" and "Dog" from the more violent members of the Duma. Deputy Akhanatieff, a priest, denounced the Holy Synod for its prohibition of prayers for the repose of the soul of Lieutenant Schmidt, the mutineer of Sevastopol. He said that the Ministry was marked with the brand of Cain and ripe for divine vengeance. The Group of Toil, a faction of the Duma formed by the peasant and workingmen members, now numbers 150, and is steadily gaining influence as the moderate policy of the Constitutional Democrats proves futile. William J. Bryan, on his

trip around the world, spent several afternoons in the Duma and was photographed in the hall with a group of peasant Deputies. He refused to express any opinions on Russian politics. The Duma appointed a committee of three to investigate the massacre of Bialystok. The Government has ceased to present any proposals for laws to the Duma, and since the Czar's ukase prohibits the Duma from initiating legislation, there is noth-

in his ukase establishing the Duma expressly reserved the right to dissolve it at will, this would be equivalent to open rebellion. Professor Miliukoff, who is now one of the leaders of the dominant party in the Duma, is well known in this country, as he was a lecturer on Russian institutions in the University of Chicago. While all these exciting events are taking place in his empire, the Czar is amusing himself playing tennis at Peterhof.

The attempt to assassinate the King of Spain. This photograph was taken the moment after the explosion of the bomb, the smoke of which may be seen in the background near the arch. Soldiers and spectators are running to the spot. The carriage in the foreground preceded the King's in the procession, and in it the royal couple were conveyed to the palace.

ing left to do but to pass resolutions of protest. The attacks upon the Jews hasten the crisis, and a general rebellion, with or without the authority of the Duma, is the most probable outcome of the situation. The pessimistic feeling now prevailing is reflected in the Stock Exchange, where Russian bonds and industrial stocks fell heavily to a lower level than ever before. Professor Miliukoff, when asked what would be done if the Czar dissolved the Duma, replied that it would meet elsewhere. Since the Czar

### The Zulu War

Colonel Mackenzie, who has been in pursuit of the Zulu war party, overtook it in the Mome Valley, June 10th, and a severe fight ensued, in which the Zulus were defeated with a loss of two or three hundred men. What is more important, Chief Bambaata, who instigated the rebellion, was mortally wounded, and his body was found two days later. This will probably end the war. The Natalian troops lost two officers killed and several men wounded.

### An Ecclesiastical Conflict in Greece

Church and State in Greece have recently come into collision in a way which for a time threatened serious complications. The difficulty arose out of a judgment of the ecclesiastical court, the Holy Synod. A certain abbot having been found guilty of serious offenses was deposed by the Synod and sentenced to some fifteen years' restraint, and to fulfill other conditions for ecclesiastical purification. This decision was suspended for a long time by the Minister of Ecclesiastical Affairs in the Greek Cabinet. At the end of several weeks, after taking legal advice, the Minister referred the matter to the Areopagos, the supreme court of Greece, which still preserves the ancient name and suggests the ancient place of its deliberations. The Metropolitan, the head of the Church in Greece, thereupon called an extraordinary session of the Holy Synod, at which he set forth the serious consequences likely to arise from this unusual procedure. At the very beginning of the session the Royal Epitropos, the solicitor representing the Crown, feeling embarrassed by this action of the Metropolitan, and regarding the Synod as attacking the authority of the Government, withdrew from the session, accompanied by the secretary of the Synod. The Synod, however, issued a declaration declaring the action of the Minister of Ecclesiastical Affairs uncanonical, and a violation of the rights of the Church. The Synod decided to appeal to His Majesty, the King. The Synod aroused some feeling among the Greek patriots and incurred censure from the Greek press by threatening to appeal also to the sister Churches in Russia, Servia and Rumania, to secure their support in sustaining ecclesiastical authority, the effect of which would have been to create international complications. Serious consequences were averted, however, by the decision of the Areopagos that the appeal to that court was irregular and could not be entertained. This decision was received with satisfaction by the people. The incident shows what strong elements of authority are represented in the national Church of Greece, and that conflict be-

tween Church and State may arise at any time if canonical privileges are overstepped on the one hand or restricted on the other.

### The New Find of Papyri

The new discoveries of the Egypt Exploration Fund, at Oxyrhynchus, surpass all hope, and are described, in anticipation of full study, by Messrs. Grenfell and Hunt, who have edited the previous Greek manuscripts found there. This time, the 131 boxes of fragments contain much literary matter, and one valuable fragment of a very early gospel. The classical fragments are unexpectedly valuable. There is a number of pæans by Pindar, quite new to us; a portion of the "Hypsipyle" of Euripides, hitherto unknown; large fragments from the extant "Symposium" and "Phædrus" of Plato, a speech of Demosthenes against Boeotus, and a Panegyric of Isocrates, and the conclusion of the lost oration of Lysias against Hippothereses. Even more valuable is a long fragment of a full history of Greece, probably by Ephorus or Theopompus. There is a multitude of other fragments, of Sappho and other lyric poets. But most interest will attach to the new gospel, which is thus characterized by the decipherers:

"This is a vellum leaf (forty-five lines in all) from a manuscript of a lost Gospel. The subject of this is a visit of Jesus with his disciples to the Temple at Jerusalem and their meeting with a Pharisee, who reproaches them with their failure to perform the necessary ceremonial of purification before entering the holy place. After a question and answer, in which the Pharisee describes in some detail the formalities which he had himself observed, Jesus makes an eloquent and crushing reply, contrasting outward with inward purity. There is a certain resemblance between this and the denunciation of the Pharisees in Matt. 23, 25, and Luke 11, 37; but the whole incident, of which the account is practically complete and very striking, is quite different from anything recorded in the Gospels. Among the most remarkable features of the fragment are its cultivated literary style, the picturesqueness and vigor of the phraseology, which includes several words not found in the New Testament, and the display of a curious familiarity—whether genuine or assumed—with the topography of the Temple and Jewish ceremonies of purification. The question of the nature and value of the Gospel to which this fragment belongs is likely to provoke much controversy."

# The Confessions of a Vegetarian

BY THE REV. CHARLES M. SHELDON

AUTHOR OF "IN HIS STEPS."

I BECAME a vegetarian before reading "The Jungle" and the Packing-house Committee report. Hence I am not to be classed with those who have been scared into a good habit. I have acquired mine after a deliberate, purposeful and cheerful study of my own dietary needs and practical experimentation which has amounted to a demonstration satisfactory to myself as to what is good for me to eat or not to eat, no matter what may be good for some one else.

It may be stated as a general fact that most people eat too much. In the year 2006, when the saloon will be a thing of the past and drunkenness from drink no longer known, societies will arise to arouse a nation drunk with the intemperance of too much food. The ordinary bill of fare in a hotel is a monstrosity. It is, however, no less so in nearly every farmhouse. I recall with a feeling of shame the immense amount of work it put upon my mother and sisters, the bill of fare we men demanded on our farm for breakfast. We thought we must have, and did have, beefsteak and potatoes, eggs, hot biscuit, coffee, griddle cakes, molasses, apple sauce and very often some kind of pie. Dinner was, in the language of the card table, several better than this, and supper was a resounding echo of breakfast. We had meat three times a day, and thought we could not live without it. It is a marvel to me now that we have any of us lived so long with it.

Six years ago I tried the experiment of going an entire year without any breakfast. I drank two coffee cups of hot water, and on the strength of that bill of fare I did a healthy man's regular forenoon's work. At the time I preached or lectured, on an average, once a day for six months, and did not miss a single engagement or have a headache or a pain. And I date from that experiment the experience which has led to these confessions.

Near the close of that breakfastless year I had the good fortune to meet a Scotch family in Dundee. They were all vegetarians—father, mother, grandmother and seven children. None of the children had ever tasted either meat or fish. A healthier or happier family group I have never seen. The good housewife did confess that there were certain seasons of the year when it was difficult to provide a varied and interesting bill of fare without meat, but there was no lack on the table during any of the meals I was privileged to take with them, and the dishes were without exception palatable and nourishing.

I may be said to date from that visit in Dundee my own conversion to a meatless diet. Since that time I have eaten meat more or less, but increasingly less, until at last I have entirely ceased to eat meat, and do not see why I shall ever again pay my toll to the Beef Barons. It would not concern me in the least, indeed, if all flesh of beasts and birds should perish off the face of the earth except cows and hens. Milk and eggs are a part of the daily fare. Potatoes, beans, peas, all green and succulent herbs, radishes, lettuce, beets, corn, celery and onions. The vegetarian (i. e., the one whose definition of the word is the same as mine) also adds to his bill of fare two other worlds of supply, namely, fruits and nuts. All fruits, so far as I have tried them, are healthful, especially apples and oranges. The most ideal way of getting fruits upon the vegetarian's table is for him to go out into his garden and pick them off the trees or vines. When that cannot be done one must fall back on or into the cold storage plant. But judicious marketing can be resorted to at different seasons of the year with success. Nuts are not understood by one person in a thousand. They (that is, the nuts) contain vast nutriment packed away in a little compass. The idea of putting nuts and raisins in the "dessert"

on the hotel bill of fare is to make the vegetarian smile. Nuts should be eaten as a part of the main bill of fare, not the finishing touch. There is great nourishment in peanuts, walnuts, pecans, butter-nuts, almonds and Brazil nuts. They are distinct in flavor and in properties, and eaten with liberal sprinkling of salt are harmless to the most delicate digestion.

There was a man once who, when the dew was on his strawberry vines, and the wren that had her nest in the box elder near his bedroom window had begun her morning thanks, arose and dressed him leisurely and strode out into his little garden at the back of his lot and without losing any of the wren's melody plucked him a bunch of radishes, cut a liberal supply of heads of tender lettuce, picked a pan of strawberries and while in the garden took out of the soil several handfuls of young beets with their tops and also picked a dish of green peas. Going back to the house he picked over and washed the vegetables and berries, laying the peas and beets aside to be cooked for dinner. The radishes, lettuce, berries, together with a pitcher of milk and a plate of crackers or bread go on the table. Breakfast is ready. There has been no banging of stove lids. No frantic stirring of the hot fire on a hot summer morning. No greasy odor of bacon or beefsteak pervading the house. No toilsome and lengthy preparation on the part of a flushed faced "hired girl" to get ready coffee, steak and hot biscuit for reluctant stomachs of people who are going to leave half the breakfast on their plates to be wasted or served up again in hash. The time this man uses to get this breakfast ready is the time spent by the wren in her morning devotions, but it is enough. I could tell the name of this man and of this wren, but these confessions are already too personal.

Not only do civilized people eat too much, but they spend twice the time necessary in getting food ready to eat. I do not see why my wife should be expected to spend more than half her lifetime planning meals and getting them on the table, or why another woman called the "help" should spend three-fourths of her time in washing a multitude of dirty dishes and putting them back on the table to be dirtied again. The vegetable habit simplifies life. It helps us do other things besides get our meals. Ten minutes is time enough to get breakfast. Then we have leisure to eat slowly the little we have. The general American plan is to spend half an hour getting twice as much food on the table as the family needs and then omit family prayers and hurry thru breakfast in fifteen minutes.

If THE INDEPENDENT prints this article I foresee trouble for myself. People are going to write to ask what the vegetarian does when he is invited out; when he is one of the victims at a banquet; when apples are two for a quarter in New York; when the frost has taken the peaches in Delaware and the potato bug has eaten all the invisible supply in Nebraska. These things do not trouble me. Most of my friends have enough on their tables besides meat to keep me from starving until I get home. If apples fail, I fall back on prunes. At most banquets there are radishes, celery and olives. If potatoes are high, I can thrive on rice.

Meanwhile I have the satisfaction of unusually good health and the consciousness every day that, so far as I am concerned, no man need work in an abattoir, and the double satisfaction of the consciousness every day that, so far as I am concerned again, the Beef Trust can get nothing out of me.

TOPEKA, KAN.

# The Meaning and Necessity of Ship Subsidy

BY WM. P. FRYE

[United States Senator William P. Frye, of Maine, as Chairman of the Senate Committee on Commerce, has devoted more time and study to the question of ship subsidy than any other American. He has been an active advocate of some form of Government aid, for a quarter of a century. —EDITOR.]

FOR many years I have earnestly advocated any form of Government inspiration which seemed to me to promise to infuse new life into our foreign trade shipping interests. In the past fifteen years, as chairman of the Senate Committee on Commerce, I have presented various bills (only one of which—thru never coming to a vote—failed to pass the Senate), to be stranded, as a rule, in the House. The present bill, which passed the Senate in February, is still hidden somewhere at the other end of the Capitol. I have no doubt that it would pass the House if they were permitted to vote on it, but it will probably lie where it is till the close of the session. In the meantime our shipping interests remain neglected, and apparently will continue so till sufficient public interest is in evidence to demand better attention.

As an American I confess that it is most humiliating to me to travel round the world and never see an American flag except on the homes of American consuls and diplomatic offices—no American flag in any port abroad. Our country is one of the most powerful, one of the wealthiest countries on earth. It is a great maritime country, with an enormous coast line over ten thousand miles in extent, with great harbors and great rivers, with a commerce which last year amounted to over two billion six hundred million dollars, with iron and coal enough to supply the whole world, forests without limit and skilled labor sufficient to produce anything, and yet this great nation has permitted its commercial rivals to seize upon all of the great pathways of the oceans, almost entirely excluding us from them. This is what to me, as an American citizen, is humiliating beyond expression.

Last year, for example, not an Amer-

ican vessel entered or cleared, in the foreign trade, in Austria-Hungary, Denmark, Italy, Netherlands, Russia, Spain, Norway, Sweden, Portugal, Greece, Scotland or Ireland; only one in France, two in Germany, fifty-seven in England—forty-seven being credited to the American line, which was started a few years ago under the unfortunately amended effort which Congress made toward ship subsidy. The other ten steamers were also built in expectation of the shipping bill of 1901. For the entire continent of Europe there were 88 American entries out of a total of 4,154; 90 American clearances out of a total of 4,490—47 being those of the one American line. A few years ago our consul at Bergen, the principal port of Norway, imposed certain fees and taxes upon a little vessel, the "Hamilton Fish," which, accidentally, I think, entered the port. His attention was afterward called to the fact that these fines had been repealed by Congress several years before. In his letter refunding the charges the consul wrote: "The fact that I have been consul here for fifteen years and that this is the only American vessel I have seen may be some excuse for my ignorance of the law."

It seems to me that this picture ought to humiliate and mortify every patriotic citizen of the United States who glories in the power and the prosperity of his country. But it is more than humiliating. It is absolutely dangerous to be so utterly dependent upon the other nations of the world. In times of peace it is bad enough to be helpless in the hands of foreign carriers, at the mercy of their pleasure and their rates; but suppose there is a European war; suppose Great Britain and Germany come to conflict of arms and demand all of the transports

over which they have control, gathering them in from those lines that are now crossing and re-crossing the Atlantic and Pacific, who is going to carry our billion, four hundred and eighty million dollars of export? Who is going to pay the increased rates and the increased war premiums on insurance of goods carried in these ships, if at all? In my opinion the farmers, the manufacturers, the wage workers of the United States would have to pay a penalty nearly, if not quite, equal to that paid by either of the contending parties, wiping out the financial benefits to be derived thru produce exported at war prices. I fail to see how any one can be blind to our dangers in this regard. It is no less if the war should be our own. Our brief, decisive war with Spain compelled us to hunt the seas over for transports and colliers, to purchase or charter forty ships from foreign nations. If the war had lasted a year or had been with a more powerful nation, and neutrality had been enforced as it should be, we should have been in most serious straits. As it was our producers paid heavy penalties in increased rates.

Even from a purely commercial point of view and in peaceful times can anything be less helpful to us than the employment of agencies whose interests are entirely antagonistic to our own? Can we expect foreign carriers to be ambitious in extending our foreign trade?

It seems to me that every loyal and patriotic American must participate with me in this humiliation and anxiety; must feel, with me, that something ought to be done; must ask, in all seriousness, What is the cause of this condition of things? There is only one cause—American wages. That is all there is to it. American wages increase the cost of our ships for the foreign trade at least 25 per cent. In the raw material we can very likely produce the ships as cheaply as they can be produced anywhere in the world; but the raw materials are but half the cost of the ships. The construction is the other half. In that construction we pay the men who do the work twice the wages that are paid on the Clyde today; more than twice the wages paid in any German shipyard, and a good deal more than are paid in Norway. Our vessels today cost at least 25 per cent, more than

exact counterparts built in any other country in the world.

And after all the building of the ship is but a small handicap. It is the operating of the ship afterward which excludes us from the ocean. To make this plain I will give a few items from a careful comparison of three practically sister ships which I had prepared for the Senate a short time ago. At the time the figures were absolutely correct, and I do not imagine they have materially changed. The comparison illustrates what exists over all the oceans. On the three ships—the “St. Louis” of our own line, the “Oceanic” and “Kaiser Wilhelm der Grosse,” leaving out the pay of the masters, which is arbitrary, the monthly wages on the first amount to \$11,305, on the second to \$9,800, on the third to \$7,715. But the “Oceanic” is larger and faster than the “St. Louis,” carrying 47 more men and the “Kaiser” is larger still, carrying 120 more men. If they are both reduced to the speed and number of men of the “St. Louis,” it will be found that the German ship is running at a monthly cost for food and wages of one-half that of the “St. Louis,” and the British ship at one-third less. I carried the comparison much farther, between ships running to South American ports and on the Pacific, with as great or greater divergence.

It appeals to any man of ordinary sense. How are we going to run American vessels against foreign ships with this difference? What are we going to do about it? The conditions causing the difference cannot be materially changed. The wage rate has adjusted itself in all lines, in America, very much higher than the same wage in foreign countries. It is no easier to cut down the wages of seamen than of miners or mill hands. Mr. Clyde, a man of large shipping interests, who appeared before the committee, gave us an excellent case in point. He ran an American ship between New York and Haiti and chartered a Norwegian ship of exactly the same size to alternate between the same ports. To his amazement he found that the pay on the Norwegian ship was but one-half what he paid on the American ship. He undertook to adjust it. At the end of a week he had secured four men at Norwegian wages and got

them on board the American ship. That night one of them went on shore and barely escaped with his life, being immediately mobbed because he had signed under the American flag at Norwegian wages. The other three fled.

Men say: "Suppose you ship your crew in Liverpool; will you not obtain your sailors at Liverpool prices?" Not a bit of it if you fly the American flag. Sailors know as much about wages as the men who run the ships—as men applying for work in mines or mills. Tho he knows that he has better living and better quarters on the American ship he will not sail on her from a foreign port unless he has the regular wages of American ships. The food on American ships is regulated by act of Congress, so that it costs today ten cents per man a day more to feed our sailors than it costs on British ships and a great deal more than it costs on the ships of some other nations.

For the benefit of those who may not fully realize this wide and universal difference in established wages, I will insert a careful and accurate comparison between ships of practically the same size and work, which I had prepared for the Senate:

Beyond this there is another point to be reckoned in considering the question. Of all the steamships in the world of fourteen knots and upward 80 per cent. are subsidized by the countries whose flags they carry. Great Britain is reasonably wise in matters of this kind, and in various aids paid, in 1901, over six million dollars. France paid over seven millions. Germany, only beginning to reach out into the world's commerce, paid more than two millions, and established two new lines to the East which she heavily subsidized. Spain paid to one single line a million six hundred thousand. Japan, four years ago, was paying four and a half millions. The United States, with the largest coast line, the largest production, the most necessity for foreign markets and the worst handicapped service, by dint of long pressure, paid nine hundred and ninety-eight thousand dollars.

These nations have paid the postal subsidies to establish mail lines from their great commercial ports to the commercial ports of the world for purposes of trade and for nothing else. The mail must precede trade, and they have paid over twenty-five million dollars a year for the one single purpose of

putting themselves in a position to dispose of their surplus products in the markets of the world. There is not a nation of the world that needs markets for surplus products more than the United States of America. Is there any one so foolish as to dream that in endeavoring to find those markets it is profitable for us to seek them thru our enemies in trade? Who doubts that an American ship, commanded by intelligent, active, earnest, interested American officers, is a better instrument for the distribution of our products abroad and for the finding of new markets than a foreign ship, officered by foreigners, who are and will be dangerous rivals in those very lines?

There is one way—and I know of only one—by which we can recover what we have lost and retain our proper position upon the seas. The Treasury of the United States must at least equalize the difference between the conditions. And why should it not equalize these conditions when the Government protects every other industry in the entire country for purposes of trade? Why should it neglect utterly and entirely and leave to the mercy of foreigners that interest which, from a national point of view, is of much more value to the Republic than any of the others? The policy of protection is indorsed by the country, and it seems to me that it has been beneficent. Industrially we have really no peer today. Nearly every industry has been protected, to enable it, against existing handicaps, to compete with the world and is flourishing. The one which, from a national point of view, is the most important of all, has, for fifty years, been utterly neglected, compelled to compete without protection against protected rivals, which, unprotected, would still be at very great advantage. The natural result has followed. In 1901 we carried only 6 per cent. of our exports under our own flag. The report of the New York Produce Exchange, a few years ago, stated that of 55,764,000 bushels of grain shipped that year from New York to foreign ports, not a bushel went on an American vessel.

We had an intimation of what the benefit of protective legislation might be when the bill of 1901 was pending. It passed the Senate, and friends of the bill

had every assurance that it would pass the House. Shipbuilders wrote me for my opinion, and I told them frankly that I believed the bill would become a law. On the strength of this confidence they began work in their yards on large ships of great speed to be used in foreign trade. If that bill had become a law, instead of carrying only 12 per cent., as we did last year, of our enormous commerce, which amounted to over two billion, six hundred million dollars, we should have carried at least a quarter of it. Even in the result of that mistaken confidence, which lasted long enough only for a start, we have this suggestive result: while in 1900 we carried but 6 per cent. of our exports, in 1903 we carried 9.1 per cent.; in 1904, 10.3 per cent.; in 1905, 12.1 per cent.; entirely due to the fact that these ships had been built in the expectation that that bill would become a law.

Another suggestive indication is the magnificent fleet of coastwise, river and lake vessels which we have today carrying hundreds of millions of tons of freight and hundreds of millions of passengers at lower rates than are elsewhere known, because for a hundred years this industry has been protected by a law prohibiting any foreign vessel from engaging in it. We are spending hundreds of millions of dollars for the construction of a canal for the accommodation almost entirely of foreign ships. We have spent in the neighborhood of five million dollars on the harbor of Galveston and but one American ship uses it. Millions of dollars have gone into deepening and perfecting our harbors to permit foreign ships to come to our docks. Last year we spent four million dollars for lighting our coast and only received a million dollars in tonnage taxes. It was almost entirely for foreign ships. In fifteen minutes we agree to build a warship costing five million dollars. We pass a river and harbor bill, as we ought, carrying fifty million dollars. But I believe that the highest duty of the United States today is to provide protection which shall encourage American vessels to compete in ocean commerce. I do not consider that mail subsidies alone are so essential. The aid should extend to all ships, sail or steam, registered and engaged in the foreign carrying trade. It is the purest kind

of democracy. A postal subsidy is aristocracy. It means monopoly. It is paid to but one great line, running between two ports, practically excluding other lines from running between those ports. We should seek to encourage the building of ships by any man who has money enough to build them and the establishment of lines by any corporation that desires to run between any ports they choose. This can never be accomplished while the facts remain as they are to-day, when an American vessel plying between New York and Brazil, charging \$7.50 a ton, and a Spanish vessel between the same ports, charging \$5 a ton, make precisely the same profit. It will never accomplish itself while conditions remain as in the last thirty years, when our shipyards have been building possibly one merchant ship for foreign carrying trade a year. It will never be accomplished till we do what other nations are freely doing for a better conditioned merchant marine and what this nation does with lavish hand for almost every other industry, infusing life by the benefaction of the Government; for every appropriation from the revenues of the Government, except for running ex-

penses, is in the form of what is underlying a subsidy. It gives new life to what would not exist but for the force which the Government infuses by its payments out of the Treasury. We do not make an appropriation of the kind that is not a subsidy.

For nearly a quarter of a century I have been trying to solve this problem and restore the mercantile navy of the United States to the oceans of the world. I have taken more interest in the subject than in any other and given it more thought and care, and in arriving at these conclusions I cannot help thinking that the opinions are entirely unselfish, because I do not own one cent's worth of interest in any ship in the world or any stock in any ship corporation in the world, nor do I ever expect to. A few years ago I did own an interest in a schooner. I had not heard from the ship for some time, and seeing that the price of schooners had gone up I wrote to the agent to sell out immediately. He replied that my schooner had run on the rocks three years before and was a total loss without insurance. That ended my connection with ship property, but not my interest in American shipping.

WASHINGTON, D. C.

## The Fortune Teller

BY UNA SOTHERN

“**I**N the spring a young man's fancy lightly turns to thoughts of love.” It cannot be helped and ought not to be different. Love is in the air, kissing the world with a thousand blossoms. There is such an industry of bird wings above, such a clapping of green leaf palms in the pleasant wind, such a sparkling gaiety of dew upon the roses, such a sweet droning of maiden bees among the flowers that even the old are young for an hour or a day, and feel once more the truant heart of youth calling them away to some adventure.

One June morning the writer, who is past mere love fancying and was long

since settled in a marital peace of mind, felt the spiritual lilt of such a mood, and, casting aside every weight that doth so easily beset the middle aged, she locked the door of her house and took a holiday—not a vacation, mark you, for a vacation is the most conventional of pastimes, and any one from a millionaire to a green-grocer's clerk is capable of taking one. But a holiday is quite another matter and belongs only to the one who can win it out of the vagrant mind of Nature herself. It is a brief day stanza set in the year's prose which rhymes us back to the memory of sweet follies by the very shadows that lie upon the grass.

There is a scallop of green hills around the sunrise arc of this city, and I had already spent several hours among them when the door of adventure opened to me. I came upon a little gray cottage, moss grown and hidden like a wren's nest among the trees. But its private air was contradicted by the number of people passing in and out. "Evidently," I thought, "there is a wedding or a funeral in progress." My surprise, therefore, was complete when I drew nearer and beheld this sign painted above the door:

"FORTUNES TOLD HERE.  
SATISFACTION GUARANTEED."

And in sterner, crabbed lettering beneath, as if it had been a scalding afterthought: "Madame sees no one for less than 25 cents!"

I entered the house, bent upon discovering, if possible, how satisfaction "could be guaranteed" in the fortune telling business. No minister in the city expected such power of belief in his congregation, and not one who did not offer a more credible return for faith. Yet here was a room filled with every class of believers and unbelievers, as I saw at a glance, tremblingly awaiting their turn before an old woman with a deck of cards in her hand. And they would come away more deeply affected by her witch prophecies than they had ever been by the most convincing gospel. Doubtless we all have a little strain of the charlatan in us enough to make us look for signs and wonders.

Evidently Madame was no respecter of persons. Whites and blacks sat side by side awaiting their turn, and they were received without reference to rank, class or color. There were eleven people in the room, four negro women, a very handsome matron whom I recognized as a society leader, an old woman with a brass ring on her finger, a country girl, an old maid, two fashionable young ladies and a young man standing beside the mysterious door which had just closed upon his sweetheart. Everybody talked, and the subject was the wonders

Madame had performed. I could see that each one was curious to know why the others were there, and a number were willing to tell. A black woman seated between the fashionable young ladies confided that her stepchild had run away and she was there to consult Madame about finding him.

"She'll tell me right whar he is," she exclaimed. "I been comin' here seben years an' she ain't never fooled me yit. I had two men courtin' me when I mar'ed, an' took the one she told me, an' I done well."

"But you might have done better, perhaps, if you had taken the other," I teased.

"Lord, m'am, dat other man turned out ter beat his wife!"

"Still, if he had married you, he might have been kinder," I persisted.

"I dunno 'bout dat. Ef er man beats one 'oman, he's mighty apt ter mistreat airy one he gits his hands on!"

At this moment the door opened and I had a vision of the presiding genius of the place—a little old withered woman, with wide, thin nostrils in a high nose; the pupil of one eye was half covered by a cataract; a mass of beautiful brown hair covered her head that was not even tinged with gray. She wore a short slip of gray checked calico, which showed three inches of white stockings above her red slippers.

As the young girl turned her back to join her companion at the door, we saw Madame catch his waiting eye and shake her head. Then casting a look of shrewd contempt upon us she screamed:

"Next!"

When the door closed upon the country girl there was a ripple of excitement, and some one asked:

"Why did she shake her head at the young man?"

"Because," explained the old woman with the brass finger ring, "that gal's as fast as th' wind. Madam's found hit out an' she's warnin' him agin trustin' her. He suspected somethin' an' brung her out here ter make sho'."

So, this damaging wag of the head was one of the ways of giving "satisfaction." Evidently the girl did not suspect the treachery, as she went away chattering hysterically to her silent lover. How sad

that love's young dream should be clawed by a witch's hand upon such a perfect day for loving. I prayed that the boy might not be able to hold the hateful suspicion against the young creature, who after all was only as "fast as the wind," and would doubtless go slow enough in "double harness." For I cannot help believing that if every one old enough would love and get married each spring we should have a much more moral time all the year around.

But now we were interrupted by sounds of woe which came from an old, fat, black mammy who sat in the darkest corner of the room. Her bosom rose and fell tremendously, and the tears were rolling down her cheeks faster than she could wipe them away with the corner of her blue checked apron.

"What is the matter with her?" I inquired of the woman who had lost her stepchild and who seemed to be a pleasant gossip.

"Her time's next, an' she's had trouble wid her husban'."

"But why does she come here?"

"Oh, hit's erbout er 'oman."

"How does she know?"

"She don't know, dat's how came her here. She gwine ter ax Madame if er'nother 'oman ain't de cause of de way her ole man's carrin' on."

Again the door opened and Madame flashed her red slippers contemptuously at us as she dismissed the girl and received the old woman, still sobbing.

"What did she say?" I whispered as the girl passed me on her way out.

"She described him exactly and said we would be married soon!" She flushed happily. And evidently she was "satisfied."

The room was crowded to suffocation by this time, and many were turned away. The men, I was told, came to consult Madame upon business adventures, that they rarely asked her aid in love affairs, having more confidence than women in their ability to succeed in a romantic way without the help of prophecies. They were silent and ill at ease, but they made no attempt to conceal the cynical amusement with which they listened to the women talk of Madame's miracles. It is a blessed dispensation of Providence, I think, that men never realize the fact

that they are as credulous as and far simpler minded than women. This invincible ignorance of their own limitations gives them the chance to cultivate an essential courage and assurance which women, with their keener comprehension, can never have.

At the end of half an hour the old mammy reappeared, looking like a dark thunder head of rage. She strutted toward the open door, tying on her bonnet and talking to us all indiscriminately.

"I knowed she'd give me satisfaction! She ain't never failed."

"What did she tell you?"

"Told me jest what I s'picioned anyhow! 'Lowed hit wuz dat low down yaller huzzy on Nebo Hill. Nasty, stinkin' thing! ter take er ole 'oman's husban', an' *him* old enough ter be her daddy. I lay I'll settle *her* hash before de sun goes down."

And I have no doubt that she did. But now I began to understand how comprehensive Madame's knowledge of human nature really was, and how much more she knew than the rest of us about giving "satisfaction." I observed that every person she dismissed was more or less credulous of what she had "revealed" to them. The society woman expected to find a stolen bracelet according to the directions she had received. Two men consulted her about a horse race and put their money unquestioningly upon the one she indicated. The fashionable young ladies almost forgot their well bred reserve in delight over the "good things" which she promised them. For she showed a cruel wisdom in the way she observed that scripture which says: "To them that hath shall be given," foretelling riches and lovers to the prosperous, while the poor and unfortunate often came out excited with the expectation of some new calamity. It was because they could be more credulous of disasters than of good fortune.

At last my own turn came, and I confess to a queer, quaking sensation as the door closed upon me and Madame motioned me to a seat opposite her. But, in spite of a warning revulsion, her manner was indescribably fascinating as she shuffled the cards and watched me. It was subtle, witty, winning and interrogative. I remained discreetly silent, but I

have never experienced such difficulty in that difficult role. My unexpected inclination was to tell her everything that I knew, hoped or felt. She cut the cards, looked at the first handful, then at me with great compassion.

"My dear lady," she said, "you have had a heap of trouble, now hain't you?"

I was on the point of admitting as much when I reflected that only a fool or an idiot could live to middle age in this trying world without having had "trouble."

"And you are married," she went on, "and you have children." I flatter myself that I have an unmistakably maternal expression. "But you hain't er widder, air you?" Before I could think what not to say to this unexpected question, she took another squint at the cards, dropped them, beat her head with her hands and exclaimed: "Oh, my God, lady! I see your husband's dead face looking over your shoulder!" I was horrified, but I thought I still had sense enough to convict her of fraud upon her own testimony and broke silence to ask.

"But, Madame, how do you know this is my husband whom you profess to see? Is he fair or dark?"

"Dear lady, thar's no difference in complexions in dead men. Light or dark, they all have that saller look when they air dead. An' the man I see is stone dead!"

"Still," I exclaimed with pardonable heat, "my husband is *not* dead!"

"If he ain't already he will be soon. It'll come sudden, may be afore you see him agin."

"Madame," I exclaimed rising, "on the sign above your door you publish 'satisfaction guaranteed'; do you think that I *wish* the death of my husband?"

"Meaning no disrespect, dear lady," she answered, clawing my shoulders with her thin old hands, "you'll not be er widder long!"

The world was still fair as I hurried away toward the city. The setting sun spread a fan of yellow light above the green hills, and there was a faint, sweet perfume of locust blossoms in the air, but where was the truant heart with which I began the day? Now I was only an elderly woman chiding myself for neglected duties and for meddling with

"black magic." Besides, what if something had really happened to John during the day? I resolved never to leave home again without giving him an exact itinerary of my movements, so that he could find me in case I was needed. I received no comfort from recalling the contempt with which I observed the credulity of Madame's other victims. The aching point in my own mind was that something might indeed have happened to him, no matter how foolish fortune telling might be regarded as a science. I was ashamed to pray under the circumstances, still I hoped that heaven had watched over him, even if his wife had neglected him for a ridiculous adventure. Involuntarily I quickened my pace.

The reaction was complete, however, when I turned the last corner, came in sight of our house and saw him seated upon the veranda reading the afternoon paper. I began to laugh hysterically; then I composed myself, climbed the steps with great deliberation, and no one would have supposed from my nonchalant greeting that for an hour I had suffered all the pangs of widowhood by anticipation. I noticed, however, that John's own welcome was a trifle warmer than usual.

"It has been a grand day," he said as I seated myself beside him.

"Yes," I consented with guilty reserve.

"Almost makes even old people like us want to do something young and foolish."

Was there something tentative in his tone? I longed to confess, but felt the delicacy of the situation too keenly. How was a wife to tell her husband that she expected his death? How explain her visit to a fortune teller? Presently I realized that the silence between us was getting to be embarrassing for some occult reason; and I ventured:

"John, did you ever have your fortune told?"

To my surprise he flushed painfully and answered evasively.

"But I have an especial reason for wishing to know," I insisted.

"Well, the fact is, I have. Why?"

I grasped him imperatively by the arm in my eagerness and felt it tremble at my next question.

"Did she tell you that your wife would die soon?"

"What if she did. No intelligent person would believe such nonsense."

"Of course not; but didn't she say that?"

"Well, the fact is, this morning——"

"Oh, it was today then," I interjected maliciously.

"——this morning," he went on doggedly, after the manner of a man who has been caught in an absurd predicament, "I happened to pass the old fortune teller's cottage on the Nebo road, and just because the day reminded me of the time when I used to do such things I went in——"

"And she told you that I would die soon!" I was determined that he should not evade the issue.

"She did say something like that," he admitted.

"Well, go on! Didn't she tell you that you would not be a widower long?"

"Hang it, Mary! what if she did. You know I never will!"

"No, I do not," I rejoined, "and I know that she told you that; said she saw my dead face looking over your shoulder, I'll venture!"

John started, regarded me warily as

one would a witch, or any other doubtful person.

"And," I went on, "you have been worrying all day, wondering where I was, if anything had happened to me, and so on. Well, I have been to consult Madame too, and she told me that I should be a widow soon, but that I should not long remain in that disconsolate state!" I clasped him around the shoulders and wagged him to and fro in my relief and merriment.

But John would not be merry. He plucked me off and stared at me frowning.

"Why did you do such a silly thing?" he demanded.

"For the same reason that you did. The spirit of the day moved me. Maybe I wanted to take another shy at the hill-tops of love and hope!" I rejoined maliciously.

John has a slow wit, and he requires a longer time to see the point of a joke when he is the victim. But now I saw the frown pucker into little cross stitches of humor around the corners of his eyes, then the laughter leaped up in them, and we rocked together in mutual enjoyment of the situation.

## New York—The Sham Musical City?

BY E. I. PRIME-STEVENSON

[New York is the only city in the United States that pretends in any way to offer a real musical season, in the European sense of the word. But, if Mr. Prime-Stevenson's strictures are true, there is no musical public and public taste in New York worthy the name. Mr. Prime-Stevenson was for many years the musical editor of *THE INDEPENDENT* (succeeding the late John R. G. Hassard), and also was the organizer and conductor of the large Musical Department of *Harper's Weekly*, as well as active in many other musical charges, before going to reside permanently in Europe, some years ago.—EDITOR.]

ANOTHER music season is finished in New York. Concert halls and opera house are closed. The press and public are talking of what a brilliant artistic course of things has again gone on, "in the most truly musical city in all the world."

Let us see on what a basis are built New York's taste, and its pretension to offering New Yorkers much good music.

Or, rather, let us see on what the pretensions are *not* built; despite all subterfuges.

The first thing that makes a city really a city of superior music is abundance of good orchestral and vocal concerts. To have that abundance, the first thing is at least one *thoroly* good, vitalized, local orchestra. It should be one established on a money-basis more or less independent

of the public, and under a first-class, fixed leader. England, France, Germany, Austria, numerous cities in Italy (even in Italy, where abstract music is always subordinate to opera) we have only to look right and left to see such conditions—London, Brussels, Paris, Bremen, Lübeck, Hamburg, Berlin, Darmstadt, Dresden, Hannover, Leipsig, Breslau, Wiesbaden, and so on, down into Milan, Florence, Rome, Naples and Palermo. But nothing whatever of the sort, in basis or quality, exists in New York! All efforts to establish such a thing have failed time and again. There is not one really first-class concert orchestra in New York. The *latent* materials are splendid for such a thing, now as for twenty-five years. These materials are yet incoherent. "But," says somebody, "the Philharmonic Society." The Philharmonic? The Philharmonic Society of New York, tho occasionally its work is somewhat galvanized into life and decent precision when some foreign "star" conductor—Safonoff, Weingartner, Pantzner, Colonne or Wood—is brought over to stir it up, is a mixture of good but badly trained new material, along with a mass of quite superannuated, second-class players. Its toneless and crude aggregate is quite unworthy to be compared with any of twenty-five, forty, fifty European symphonic bodies. Rehearsals are usually insufficient, and the sense of their value is dulled. No splendor of tone, no fire, no *Aufschwung*—even when good leadership would fain electrify it. The Philharmonic Society at present imports its leaders—a pernicious device. But it has never been without the chance of maintaining first-class permanent ones. It has never been able to retain one! Thomas, Seidl or Paur were not valued nor supported adequately. Each leader knew what dead wood, unappreciativeness, cabals and patiently wasted effort meant. You cannot make a silk purse out of even a superior sow-ear. The programs are shut off from real cognizance of contemporary music for the higher concert stage. A stale old round of works is held to. The number of concerts is small. The prices are exorbitant compared with any European series. There is no municipal aid; not a penny!

The patronage is—like the most of musical patronage in New York—two-thirds for fashion-sake, and one-third (if so much) for art. People who cannot turn a tune solemnly go to their Philharmonic boxes every year, as a religious duty; just as they subscribe for the *New York Observer* or attend the Charity Ball, long after reading days and dancing nights are a tradition.

The other orchestral societies or undertakings in New York are—as to several—far more interesting, vigorous in aims, and useful than the Philharmonic, including some recent ones. Damrosch (as did his father) and several busy others—all are doing what they can. But the chances of uncertain material, of uncertain local interest, of public indifference, and of danger of shipwreck, hang over all their efforts. Not one such band is a permanent, a subsidized one. New York does not care enough to make it so. For high-class orchestral institutions and work New York, as a city, cares nothing, or next to nothing. It is a wonder that the societies "get on" with as much of a lease of practical aid as they struggle to obtain. And the well-meant, often generously-met appeals of certain New York women to save or to foster this or that orchestral situation are pitifully misdirected and a waste of energy and cash.

Choral music in New York is most inadequately represented. Only by a faithful few is it supported. Not one New York choral society compares in size, balance, in quality of work, in activity, in permanency, with a vast number of singing organizations (either as adjuncts to local orchestral work or independently) in countless second-class and smaller musical cities of Europe; not to point to many of the larger national European capitals and provincial centers, from Hamburg to Rome. Many new and old choral works of the first beauty, value, importance and popularity in Europe are *never* sung in New York.

An annual offering of "The Messiah," or possibly something as "recent" as Brahms's "Requiem," from other organizations, and similar sporadic matters, are (like the celebrated remark of Emerson as to Fanny Ellsler's high pirouette) "not

art, but religion." They are wholly unknown. With all respect to the ancient Oratorio Society and certain more democratic bodies, the best choral society of New York is probably the Musical Art Society. That is a small and *dilettante* matter, supported by a fashionable element, and dependent on that for existence. Its aims are not yet clear. Mr. Frank Damrosch's popular labors do not go far enough, cannot do so. Choral material of good class (tho not of distinctly American sources) is plentiful in New York. Many societies could be formed and made splendidly useful. But New York does not *wish* them. It does not care for good choral music! It would rather hear "Ragtime" than Bach's or Beethoven's noblest masses, or all the lucent polyphonies of Italy's golden age of mass and motet.

There is no adequate support yet in New York for any one distinctly local organization for chamber music of the kind and quality of artists that is common in North and Central Europe. Visiting clubs to New York have, in some special cases, annually been well sustained by a fashionable corps of subscribers and patrons. But the *local* New York string quartet, or what else, in chamber music, has had a perilous career over and over. New York cares little for chamber music—one of the highest, most exquisite forms of art ever developed.

Other concerts are dependent for success almost wholly on the vogue, *réclame*, of the "star" soloists.

But let us look at another question of facilities and support—how New York houses its musical interest. There is not even one adequately good, well-planned, acoustically-successful hall for large orchestral and choral concerts in New York! The defects of Carnegie Hall are indisputable; not to be amended. Its errors of construction, taste, internal blunders as to acoustics, are patent to the observant who frequent that tasteful, rich, sumptuous auditorium.

"But," exclaims the good New Yorker, "but think of our Metropolitan Opera House! What an establishment! What a season!" Now, let us see about this annual and self-confident challenge.

First, as to the Metropolitan Opera House itself; simply as to its aspects as

a theater for music, compared with the numberless types of such edifices abroad. For the first thing for a musical performance is, naturally, that its place be one in which an artistic performance is possible. Many years ago, when the excellent old "Academy of Music" was found too small and out of *milieu* for social acceptability, and when the Metropolitan plans were accordingly in discussion, a leading theatrical manager pointed out the fact that the new opera house was likely to be "far too big" for anything except spectacular opera of the largest sonority. This was a trait that would cut off half of the finest operatic repertory yet written. He also pointed out that the building's size would probably injure the vocal effect of *any* sort of operatic performances in it, and also would strain, more or less seriously, the actual voices of singers in it. No such shriekings and strainings were needed in any other musical edifice of the sort. But, lo! one of the most active promoters of the new house (whose wife had not been able to get a box to her mind in the old Academy) exclaimed: "Oh, hang the performances! *What we want is room enough for the women to show themselves off!*" The result of this frank, fine, artistic insistence has been—a huge, ugly, glaring operatic hall, with bad acoustics. A hall of impossible dimensions for much other than Wagner, Meyerbeer, Goldmark, and so on. A house in which Mozart and Beethoven are ruined by mere want of *intimacy* of effects, such as "Fidelio" and "Le Nozze di Figaro" and "Don Giovanni" demand; and receive elsewhere than in New York. To make matters worse, this same opera house is hung with heavy draperies; carpeted with thick pile—to kill what resonance it might have if not so upholstered in a foolish and inartistic Americanistic "luxury." And the place where the house is built? It is the noisiest and most dangerously, inconveniently crowded corner of the most bustling part of New York's daily scramble! The trams and street venders are heard above Marguerite or Tosca or Brünnhilde.

"But," cries the manager-inspired, advertising-department inspired, and ever stay-at-home critic of the average New York daily journal, or the ignorant and

contented public—"but, our season! our singers! our repertory! Best in the world!"

The Metropolitan season presents the curious aspect of at once one of the shortest and most old-fashioned, monotonous, unprogressive and amazingly expensive seasons of opera extant! For about five months an enormous outlay is paid to "stars" of all nationalities; a large galaxy. This sacrifices almost all other details of a good opera, as we find it in German, French or Italian national conditions. The municipality of New York does not subsidize the establishment by so much as a penny! A plutocratic, merely fashionable caprice carries the seasons thru. The system is the old-fashioned, pernicious, inartistic "star" system—amplified. The "stars" include a large group of singers, supposed to be "the finest"—"incomparably" the finest—in Europe. As a fact, their equals and superiors are to be pointed out all about Europe, heard right and left; and as to many instances, may be reckoned as much surpassed. If one has due knowledge of the *personnel* engaged, their peers are plentiful on the best German-singing, or Italian-singing, or French-singing opera stages. And many of these stars of the Metropolitan's seasons now are like Sarah, the wife of Abraham—old and well stricken in years. What was their fine estate of voice seems gravely compromised. On grounds of "age-limit," apart from all other, a thoro change is in order at the Metropolitan Opera House, as to many singers. But, ah, ah, just this is as inconvenient a managerial policy as it is risky, in a city where the public has no educated, free and sound standard of discernment, and *likes* to think that "no better" nor more eminent singers exist than Herr X, or Signor Y, or Frau Z. And as to this idea, the daily press of New York always is in too suggestive relationships with the advertising department of its journals. Quite lately, too much that is unpleasant has been spoken of, as to direct, or indirect, personal relationships between critics and artists and enterprises of musical sort—relationships that certainly, if half-true, tend to suppress clear and sound criticism of musical doings in New York; operatic

or other. Consequently the public are assured and reassured that *it has* the best singers in the world; and so New Yorkers are kept happy. When a first-class "new" singer is imported for some performances, the "Metropolitanites" are told that he or she is a rarity and a "discovery." Fortunate for Europe is the fact that night after night such "rarities" and "discoveries" are to be heard, merely as a regular matter! in such performances as those of Bremen, Hamburg, Breslau, Karlsruhe, Lübeck, Munich, Wiesbaden, Cologne, Dresden, Darmstadt, Hannover, Vienna, Graz, Triest, Bordeaux, Milan, Bologna, Rome, Naples, Palermo, Barcelona, and so on. It is merely a matter of knowing or not knowing; hearing or not hearing; being deceived or being enlightened, enlarging carefully each year the critic's horizon, at first hand, and then speaking the truth—or not!

The repertory of the Metropolitan Opera House is stale and utterly unprogressive. Eclecticism is half way or less. Noble classics are yearly omitted in discreditable proportion. As to new scores, while each European season of course brings to performance many operas that have only a mediocre merit or a local interest, nevertheless New York is about twenty-five years behind the use of strong, meritorious operas that as many seasons have added to the stages of different national and provincial operatic centers of Europe—added these with absolutely clear value, and, often, vast favor. Again, the performances in the Metropolitan have no solid, rich ensemble effect, and as to many composers are grotesque. Gluck is burlesqued, Mozart is turned to lead, Strauss is travestied. Above all, in the Metropolitan we meet the antique barbarism of opera *sung in languages that the supporting public—rich or poor, educated or uneducated—as a public does not understand at all!* The elegant mondaines of the boxes and stalls cannot tell you whether Siegfried is speaking intelligible German or not; whether Carmen's French be of Paris, or of Stratteford-atte-Bow; could not ask for a program or an opera glass in the tongue of the text of "Aïda" (and some of the Italian and French and Ger-

man sung in the Metropolitan is of a sort in accent to make the frescoes pale)! As to conducting, the Metropolitan now, as before now, has the advantage of a good German leader; of a distinctly superior Italian one; and (just now) of an efficient and sincere American one. But it has a second-class, or third-class, orchestra—small for the house, jaded, and of hack quality. How else?—when the musicians are not able to live by their operatic engagements, and must earn their existence by “outside” (often most inartistic) relationships to music. Again, New York opera presents the anomaly of one in which the American-born singers are, save by exception, invariably less popular than the foreign artists. Americans are less “recognized” by local critics for due worth, when that is clear; less willingly than the imported singers of other races. And as for the chorus of the Metropolitan, unfortunately that most vital necessity is inefficient, huddled together, of dubious material, mixed nationalities, and still of a visible and unesthetic antiquity not to be loved in opera choruses or old shoes. The *spirit* of a solid, artistic ensemble; of sound, yet brilliant work, is asphyxiated in most Metropolitan performances. *That* spirit cannot be met until the whole system of the place be changed, and—more particularly—till the New York *public* shall be really a *musical public*; one with correct intuitions and some sufficient musical education, to *demand* a better article—and with a vigilant, free-speaking press-criticism to voice its demand—such as is extant in old Europe, with its vivid musical life and sharp critical ears. At present the Metropolitan Opera House and its doings are not primarily, but only secondarily, a *musical* matter. Its (so-called) public that supports the house is not primarily, but only secondarily, a musical public. Primarily, the Metropolitan is a social institution, a place “*for the women to show themselves off.*” What is sung, or how it is sung, or played, is relatively a trifling matter. A pianophone and cinematograph on the stage might be just as well utilized, could that be made the vogue; or two or three “stars” and an *orgue de barbarie* brought

there three nights and a matinee in the week!

For some thirty years, season by season, having had every opportunity necessary in New York, with yearly visits abroad, and now permanently abroad, with time divided each year between musical centers from the South to the Baltic—in fact, with rather exceptional facilities—the writer has watched these conditions of music in New York, to contrast them. Regret only increases—and surprise. *Populus vult decipi*; it is true. But there is, also, too much aid thereto by the indulgent and mechanical attitude of New York newspaper comments on the season’s courses. In part, there is excuse, for the province of the average critic in New York has been forced toward mechanical and repetitious musical *reporting*—scratching down at midnight pretty much the same things, as to the same works, under practically the same circumstances of performances, year by year! It has become too much the effort for obscure, rhetorical phrase-making; for writing “all around” a topic, with no edge, no point; for *not* criticising; for *not* saying how things are, or how they are done, or how they should be done! This insincerity is mischievous. And there are odd assumptions in it. One well-known musical reporter on a great daily frequently alludes—judicially, calmly—to performances in European theaters of opera, and to concert halls in Europe, when he has never set his foot in one or the other, save during a passing trip many years ago as far as London, out of its musical season. Another cannot keep his enmities—personal out of his text. Another makes his friends into his compass—in all. Others are in relationships with musical organizations or artists that are a pecuniary aid—annotators of programs, lecturers, and so on. Others are even less in a position to speak of voices, diction, repertory or what not (even if their intentions are excellent), by lack of education abroad or at home. And so the self-complacency of the New Yorker as to his musical half year is intensified; because the musical policeman does not challenge nor arrest.

Moreover, many American cities are, modestly, far in advance of

New York as to *real* musical interest, public musical life, and its aids. Chicago, Boston, Pittsburg, Washington, Cincinnati, Philadelphia and others have left New York behind in their possession now of competent, if not always large, orchestras; of choral forces; and in *sincere* aims at artistic work in abstract music. And in time (perhaps near time) these cities or others will add the secondary form of music and less worthwhile—the opera—to their cares, even to its becoming a municipal charge.

With these as merely a few aspects unfavorable to the pretensions of New York to be "a musical city," or to care

really seriously and intelligently as to music, or to want anything better than its present most defective and slovenly status of music, there may be offered various apologetics. Those are admissible, in their degree. But they do not alter the facts. Nor will the facts be altered for a long time to come. Art and religion are matters of heart, not talk. They mean of performance, not argument. When New York is a musical city it will show it by the gospel of good works in music. From that gospel few metropolitan cities of the world are today so far; and so content to stay so far!

NAPLES, ITALY.

## Music in New York

BY HENRY T. FINCK

[Feeling that the previous article by Mr. Prime-Stevenson, should not be printed without a hearing from the other side we have asked Mr. Finck, the Musical Editor of the *Evening Post*, and the author of several volumes on musical topics, to make the following reply.—

—EDITOR.]

SINCE Max Nordau launched his notorious book, in which he proved to his own satisfaction that nearly all great men of the past and present were charlatans, fools and degenerates, probably nothing has been written more amusingly scathing and pulverizing than Mr. Prime-Stevenson's arraignment of musical New York, which is printed in this number of THE INDEPENDENT. Were half of what he says true, the music makers and music lovers of this city might as well quit, for the case would be hopeless. Fortunately, his statements must be taken with many grains—nay, tons—of salt. A few of his allegations may be admitted. It is true that the municipality of New York does not support music, except in so far as it pays for open-air band concerts, which are not concerned with high-class music. It is true that our grand opera repertory is stale and monotonous; true, also, that in the matter of choral music New York has little to boast of—a circumstance due, in part, to a lack of leadership of the highest order. It must be borne in mind, however, that the cities of Germany are the only ones in the world that have a more varied op-

eratic repertory than ours; and that, as far as the main branch of choral music, the oratorio, is concerned, New York is very far from being solitary. Even from England, the classical land of choral singing, comes the despairing cry that the singing societies for the most part subsist on the profits yielded by the annual repetitions of "The Messiah" and "Elijah," the public refusing to patronize any other works. Maybe Wagner was right when he said the oratorio had had its day, and proceeded to make a place for what was really valuable in it in the music-drama—particularly "Die Meistersinger" and "Parsifal."

Mr. Prime-Stevenson's generalizations regarding our operatic conditions must nearly all be challenged. It is not true that the trams and street vendors are heard above the singers at the Metropolitan Opera House. The present writer has attended hundreds of performances in that house, and has never heard the faintest Broadway sound. It is not true that the chorus and orchestra are second or third rate. Under the inspiring leadership of such men as Seidl, Hertz and Mottl, the Metropolitan orchestra has

very often played in a way not only to satisfy but to thrill the most critical and experienced. Operatic choruses have their on and off nights. At one of the past season's "Götterdämmerung" performances, for instance, the choruses were sung superbly; at the next, abominably. On the whole, Mr. Conried's chorus is about as good as any to be found in European cities. Our weakest side—the scenic—is not mentioned by our censor; there he missed his chance. What he says regarding our strongest factor—the vocalists—is astonishingly erroneous. "Their equals and superiors," he declares, "are to be pointed out all about Europe." Now, this is not a matter of taste or opinion, but of cold, financial fact. It is well known that no European opera house pays any regularly engaged artist more than one-fourth of what the same singer can get in New York. Backed up by Wall Street, Mr. Conried is able to offer the leading European artists terms which send them flying to this side of the Atlantic. The greatest ambition of European singers is to be able to put after their names "of the Metropolitan Opera House, New York"; they scramble for that distinction. When Mr. Conried engaged Edyth Walker there were lamentations loud all over Vienna because of the loss of the best singer in the Imperial Opera of that city. Berlin mourns the loss of what everybody admits to be her two best singers, Emmy Destinn and Geraldine Farrar, both bagged by the same American ogre, Heinrich Conried. He and his predecessor despoiled Munich of its five best singers—Ternina, Morena, Fremstad, Reiss and Knothe. He gives New Yorkers three times a week during the whole season Caruso, the greatest of Italian artists (whose only rival, Bonci, will be at another New York opera house next season). He would despoil Paris, too, but Paris has not a single great singer in its Opera at present.

As a matter of fact, Mr. Conried and Mr. Hammerstein will, between them, bring to New York next autumn nearly all the first class singers in Europe. What if, as Mr. Prime-Stevenson alleges, many of those who will hear these singers attend the opera for fashionable rather than for musical reasons? The opera has been, ever since its origin in the seventeenth century, possible only thru an alliance with aristocracy, fashion and wealth. Instead of sneering at the rich patrons of opera, let us thank them for their indispensable aid; without it we could never hear the works of the great masters. Our censor intimates that at our Philharmonic concerts, too, the fashionable element predominates. Perhaps it does; but in this case the patrons are for the most part real music lovers; there are many such among New York's many millionaires. If they are not music lovers, why do they desert the concerts of this society when, owing to inefficient temporary leadership, they fall below their usual high level? That their usual level is high—very high—must be finally asserted most emphatically against their assailant's strictures. A great deal of nonsense gets into the newspapers regarding the Philharmonic Society—its alleged superannuated members and lack of rehearsals in particular. In reality, the dead wood is removed more promptly than in the orchestras of Germany; nor are the rehearsals below the customary number. The Philharmonic Orchestra is the largest in the world. It is almost unique for its rich body of tone, its virility of utterance, and its emotional sweep, when under the bâton of a Seidl or a Safonoff; and its audience is astonishingly discriminating as to the merit of performances. To sum up: Mr. Prime-Stevenson has not painted a true picture of our musical life. We are far from perfection, but we are not so grotesque and imbecile as the convex mirror of his imagination makes us seem to him.

NEW YORK CITY.

# Is It Religious Persecution?

BY GOLDWIN SMITH, D. C. L. (OXON.)

"NINETEEN Centuries of Persecution" is the sad heading prefixed by a Jewish writer in a British journal to his story of the wrongs and sufferings of his race. Few greater calamities perhaps have ever befallen mankind than the transportation of the negro and the dispersion of the Jew. But is it true that the cause of the evil has been wholly or mainly religious? Has anti-Semitism been essentially a form of persecution? Does the blame rest on Christian intolerance or rather on the situation produced by the wandering of a parasitic race in pursuit of gain over the abodes of nations with which, clinging jealously to its tribalism, it did not unite?

The question in its present and practical bearing can of course have reference only to countries in which the special condition still prevails, in which the Jew remains unassimilated to the indigenous population and which are or may possibly be the scenes of anti-Jewish disturbance. It does not concern the Jew who has become a citizen and in many cases, as we well know, a citizen of eminence. Nor is outrage condemned or palliated by enquiring into its real cause.

Take any race you please, with any religion you please, but with an intensely tribal spirit; let it wander in pursuit of gain over the countries of other nations, still remaining a people apart, shunning intermarriage, shrinking from social communion, assuming the attitude assumed by the strict and Talmudic Jews toward the Gentiles, plying unpopular, perhaps oppressive, trades, and gleaning the wealth of the country without much adding to it by productive industry; you will surely have trouble. Offense will come. If it takes the form of violence or outrage it will be criminal. But it will come, and it will be the consequence not of a fiendish disposition on the part of the people of the invaded nations, but of a calamitous situation. Says Renan:

"Anti-Semitism is not an invention of our days. Never was it hotter than in the period which preceded our era, and assuredly when a fact thus reproduces itself everywhere and at all epochs it must be because it has deep causes which are worth study. At Alexandria, at Antioch, in Asia Minor, at Cyrene, at Damascus, war is always going on between Jews and non-Jews. In the non-Jewish towns of Palestine, at Cesarea, Askalon, Acre, Tyre, Hippos, Gadara, vindictive remembrance of the Asmonian atrocities issued in murderous quarrels perpetually renewed. The era of religious hatred opens, and it cannot be denied that the hatred was most often provoked by the Jews."

Fearful massacres were committed by the Jews in Cyrene and in Cyprus. (See Gibbon, Chap. XV and Gibbon's own remarks there.) Tacitus speaks of the Jew as an enemy of all races but his own, and Juvenal describes him as one who would not show a wayfarer his road or guide a thirsty man to a spring if they were not of his own faith. The source of the bitterness in these cases may not have been anything inherent in the character of the Jew; but it certainly was not Christian bigotry, or, in the case of Roman anti-Semitism, bigotry of any kind. To pronounce the antipathy to the Jews utterly groundless is in fact to frame an indictment against humanity.

In the Catholic Middle Ages religious intolerance was the law, and persecution was the lot of all who dissented from the national religion, whether Jews or heretics. This must have been known to the Jew when he came into a Catholic community for the purpose of his trade. He must have known also that the constitution, political and social, was feudal. He provoked the hatred of the people by acting as the regular and recognized instrument of royal extortion, being protected in his trade of money-lending for that purpose by the King. As a rule he was safe under the royal protection, but occasionally there were popular outbreaks, barbarous like all other popular outbreaks in those rough times. The Jew escaped military service. In England he was allowed to hold land till the time of Henry III, when he was al-

leged to be undermining the feudal system by his territorial encroachments. His social depression seems, as Freeman says, to have been overstated. He did not shrink from display of his wealth. At Oxford the Jews attacked a religious procession.

Even in the Middle Ages, however, religious bigotry, tho a cause, seems hardly to have been the chief cause, it certainly was not the sole cause, of popular hatred of the Jew. The chief cause probably was usury. When there is an outbreak people rush to the place where the Jew kept his bonds. As a usurer the Jew was evidently apt to be cruel. Readers of Carlyle's "Jocelin de Brakelond" will remember the astonishing growth of the small debt owed by the Abbey to Benedict the Jew. Carlyle "almost hopes that Benedict was one of those beleagured Jews who hanged themselves in York Castle shortly afterward and had their usances and quittances and horse-leech papers summarily set fire to." There is no reason to think that Edward I was inclined to persecution. His character seems to have been noble all round, and, tho religious, free from bondage to ecclesiastical influence. His banishment of the Jews, harsh or even cruel as it might be, was a measure, probably a great measure, of relief for his people. The same thing was done by the good Abbot Samson for the relief of the people of his city.

At the time of the Crusades there was a tremendous outbreak of fanaticism in Christendom, combined with a well founded alarm at the onrolling tide of Moslem conquest. Then unquestionably the Jews suffered terribly, tho for the number slaughtered we may not trust medieval statistics. The Jews were suspected, perhaps not wholly without reason, of sympathy with Islam, to which they were less uncongenial than to Christendom. It would have been well of they could have fled before the rising storm. But they stayed, and as has been reasonably conjectured, provoked popular ire by practicing extortion on those who had taken the cross and were selling or pawning their possessions to provide their outfit.

Spain, the land of intolerance and persecution, was the scene of cruelties in-

flicted upon the Jews, on which Christendom, so far as its faith had any part in them, must forever look back with shame. But the share of Christianity, however perverted, in these atrocities, was less than that of the fanatical nationality bred by the long struggle with the Mohammedan invader, whose coming, as all Spaniards believed, the Jew had welcomed. The Inquisition sent equally to the stake the Jew, the Morisco, and the Spaniard who had swerved or was suspected of swerving from the religious faith of the nation. To pretend that the Papacy was not responsible for the Spanish Inquisition is absurd. But the Jew did not suffer in other Catholic countries as he did in Spain.

Unquestionably the religious antipathy to the Jews as enemies of the faith and crucifiers of Christ did envenom the hatred excited by their trade. It took the form of calumnious charges against them of sacrificing Christian children. With Mohammedans, who had no such traditional cause of religious hatred, as well perhaps as from Oriental affinity, the Jew got on better. But the question is, What was the principal cause?

That the Jew was not himself tolerant, or a friend to freedom of thought, the histories of Spinoza and Uriel Acosta show. It does not appear that he is everywhere and entirely tolerant now. At least we heard the other day of a conflict between two sects of Jews. Nor is Purim a feast of universal brotherhood.

If, to our shame and sorrow, the Jew has suffered at the hands of Christians for his religion, he has also been somewhat a gainer by it. To a large section of the Protestant world the race has been a special object of religious interest, as the favorite of heaven, tho nothing assuredly could be less like the pastoral Jew of the Pentateuch than the Hebrew financier of later days. Large sums have been spent on the conversion of the Jews. Subscriptions have been raised for the purpose of finding the ten lost tribes. The Jew has even by some fervently Biblical Protestants been exhorted to retain the tribal rite in virtue of which the chosen people enjoyed the special patronage of Heaven.

It can hardly be said that of the nineteen centuries the last two have been for

the Jew centuries of persecution. His admission to political equality in Europe, it is true, has been slow and contested. But it may fairly be asked whether the member of a parasitic race, preserving his tribalism and tribal interests, had a plain and incontestable right to a share of political power in a community to which he could hardly be said entirely to belong. That the progress of the Hebrew in England thru the franchise to Parliament and the peerage was not so rapid as Liberals, the present writer among others, would have had it, can hardly be reckoned among the great wrongs of history. Since emancipation the Jew in England has had his full share of power, and given England in Disraeli a Prime Minister with an anti-Russian and pro-Turkish policy, who made light of the Bulgarian massacres, protected Constantinople against the Christian invader and reconsigned Macedonia to the rule of the Turk; while the Jews of Johannesburg, tho really cosmopolitan, have had interest enough to carry Great Britain into the Boer war for the furtherance of their own commercial ends.

Russia has in modern times been the most deplorable scene of anti-Jewish violence. She has five millions of Jews eating into the core of her Muscovite nationality. The outbreaks have been ascribed to religious bigotry, and have called forth, especially in England, vehement protests founded on that belief. In 1881 there was a great rising in Odessa and at other points in Russia which produced in England a passionate burst of generous indignation. From the reports of the British Consuls which followed, it appeared that, tho most deplorable things had been done, there had been great exaggeration in the accounts. The destruction of property had been infinitely less than had been reported; instead of whole streets, at Elizabethgrad, only a single house had been wrecked; few Jews had been intentionally killed; outrages on women had been rare, which was the more remarkable because, the mob having sacked the Jewish vodka shops, their passions might have been inflamed with drink. Russian women had not held down Jewish women to be outraged. No Jewish children had been roasted alive. The story of a Jew being

cooped in a barrel and rolled into the Dnieper was confuted by the fact that the Dnieper was ten miles from the town and there was no river between. Nor did it seem that the Government had seriously failed in its duty of repression, much less that it had encouraged the riots. But what was most important was that the general cause of the outbreak, in the opinion of the Consuls, was not religious, but social; in fact, was usury. The Russian peasant, seeing the Jew's wealth, said, "That is my blood." The Russian peasant is extremely superstitious, but it does not appear that he is intolerant. At least, if he is, it is toward heretics of his own race and Church. He seems to think it natural that men of a different race should have a different religion.

We find the same thing in other countries, so far as the Jews of the lower class and the peasantry with whom they come into account are concerned. Baring Gould tells us that "in Germany there is scarcely a village without some Jews in it who do not cultivate land themselves, but lie in wait like spiders for the failing Bauer." In Hungary Paget says "the Jew is no less active in profiting by the vices and necessities of the peasant than by those of the noble. As sure as he gains a settlement in a village the peasantry become poor." A writer in the *Times* said that in Austrian Poland the worst of the peasant's sluggish discontent was that it had given him over to the exactions of the Jews. In Thomson's "Morocco" we read:

"I do not know, for my part, which exercises the greatest tyranny and oppression, the Sultan or the Jew—the one the embodiment of the foulest misgovernment, the other the essence of a dozen Shylocks, demanding, aye, and getting, not only his pound of flesh, but also the blood and nerves. By his outrageous exactions the Sultan drives the Moors into the hands of the Jew, who affords him a temporary relief by lending him the necessary money on incredibly exorbitant terms. Once in the money lender's clutches, he rarely escapes till he is squeezed dry, when he is either thrown aside, crushed and ruined, or cast into a dungeon, where, fettered and starved, he is probably left to die a slow and horrible death."

For the wanderer who plies such a trade historical excuses may be found. He may have been driven by exceptional influences not under his control from agriculture and from ordinary and less

invidious pursuits. His habits are, nevertheless, exasperating to his victims, and the feeling against him, tho it may be embittered, is not produced by religious intolerance or connected with a love of persecution.

The writer was assured by a friend, than whom there could be no greater enemy of intolerance and who knew Rumania well, that there the main source of discord and outrage was not difference of religion, but the oppression of a simple peasantry by the Jewish money lender.

Vice-consul Harford, at Sebastopol, is in contact with the Jews of the Crimea, who, he says, are of a superior order, while some of them are not Talmudic Jews, but belong to the mild and scriptural sect of the Karaites. He says that in his quarter all goes well.

"The spirit of antagonism that animates the Russian against the Jew is, in my opinion, in no way to be traced to the difference of creed. In this part of Russia, where we have more denominations of religion than in any other part, I have never, during a residence of fourteen years, observed the slightest indication of sectarianism in any class. The peasant, tho ignorant and superstitious, is so entirely free from bigotry that even the openly displayed contempt of the fanatical Mohammedan Crim Tartar for the rites and ceremonies of the Russian Church fails to excite in him the slightest feeling of personal animosity; his own feeling with regard to other religions is perfect indifference; he enters a mosque or synagog just as he would enter a theater, and regards the ceremony in much the same manner that an English peasant would, neither knowing nor caring to know whether they worshipped God or the moon. As it is evident from this that race and creed are to the minds of the peasantry of no more consequence than they would be to a Zulu, the only conclusion is that the antipathy is against the usurer, and as civilization can only be expected to influence the rising generation of Russian peasantry, the remedy rests with the Jew, who, if he will not refrain from speculating (in lawless parts of the empire) on ignorance and drunkenness, must be prepared to defend himself and his property from the certain and natural result of such a policy."

Coming to this side of the Atlantic we find Olmstead in his "Cotton Kingdom" saying:

"A swarm of Jews has, within the last ten years, settled in nearly every Southern town, many of them men of no character, opening cheap clothing and trinket shops, ruining or driving out of business many of the old retailers, and engaging in an unlawful trade

with the simple negroes which is found very profitable."

Mr. R. L. Stevenson says of the Jews of San Francisco:

"Jew storekeepers have already learned the advantage to be gained from this [unlimited credit]; they lead on the farmer into irretrievable indebtedness and keep him ever after as their bond slave, hopelessly grinding in the mill."

In these American cases, again, religion could have no part. The Jew had brought over with him from Europe an ingrained habit which could not fail to make him odious to people as free from religious prejudice as any people in the world.

The homes of an agricultural peasantry have been the natural fields of Jewish usury and of the bad feeling to which it has given birth. In commercial cities the Jew is not particularly distinguished by his trade, tho he may perhaps have the character of being somewhat strict in his dealings. Antonio, as well as Shylock, lent money, tho at so easy a rate that Shylock complains of him for lowering the rate of interest.

Were religious bigotry really the cause of the evil, the cure might be at hand; for religious bigotry is rapidly departing from the world and there has been very little of late that could be called persecution. But the source being what it is, there would seem to be only two possible remedies—assimilation and re-patriation. On this continent assimilation is possible and apparently has been taking place. The public schools may have their effect on the Jew as well as on the other races. The Jew may presently learn to give up the tribal rite which conflicts with a full sense of nationality; to intermarry; to associate freely; to keep the same day of rest. He may fall generally into the ways of his neighbors. But in the cases where the strict and Talmudic Jew has settled an alien intruder among an agricultural peasantry and there subsists by his peculiar trades, assimilation would be extremely difficult. The Zionists, seeing this, propose re-patriation. In Palestine and in adjoining territories which might be added to it there would probably be room enough, and the Christian powers might oust the Turk. There would be room for a great Jewish nation.

But there would also be needful a return to agricultural and pastoral pursuits which, when the present habit is so ingrained, would be long in coming.

Nothing that has here been said or cited can in any way touch the case of those Jews who, while retaining perhaps the religion of their forefathers, have be-

come in the full sense, socially as well as politically, citizens of the countries in which they have taken up their abode, and of whom, it is needless to repeat, many have in different lines risen to the highest distinction and won a place among the promoters and benefactors of general civilization.

TORONTO, CANADA.

## The Little White Birches of New England

BY FRANK CRANE

HAVE you ever seen  
The little white birches of New England?  
First of all the wood people  
They catch the eye of the lover.

Scattered through the dun forest,  
In autumn, white against dark trunks,  
Smooth against elm, oak and hickory,  
The birches appear like maidens,  
White-robed, supple and slender,  
Going out to welcome an army,  
Mingling among mailed warriors,  
Returning victorious from summer.

Where they gather in clusters,  
It is as if tall dryads  
Had fled to the fern-covered hillside,  
Or rebellious had trooped to the lowland,  
And there had been metamorphosed  
Into slim trees, swaying,  
Plotting and whispering forever.

Have you seen they never grow upright,  
But always as if springing sidewise?  
"Escape! escape!" says their gesture,  
Sweeping with swift grace skyward,  
From the brown grass to the white clouds;  
Or ever you are aware,  
Your heart has fluttered and flown with them.

What are they? Are they the bare arms,  
The long, rounded, girlish bare arms  
Of some buried New World Krishna,  
Ashtoreth, Venus or Isis,

Dead grace of forgotten ages,  
Waving, urging still upward  
All questioning souls that pass by?  
Or are they but thin wraiths, sinuous  
Spectres of ancestral tree-nobles?

Sometimes as I round the hill's shoulder  
And spy them among the green pines,  
Picked out sharp on the dark green,  
They come over my soul  
Like sharp, articulate cries.

In summer, I remember,  
Glimpsed through diaphanous leafage,  
Their nude beauty startled and charmed me,  
As the nymphs of Diana's chorus,  
At play in their bosky seclusion,  
Might have ravished the eye profane  
Of some wandering peasant of Hellas,  
Lost in the heather of Hymettus,  
In the days when all living things had souls.

O little white birches of New England,  
You have caught my heart in your branches!  
All night like questing star-sisters  
You march thru my dreams processional,  
Weirdly beckoning, calling up  
Nameless ivory fancies.

O my little sisters,  
He who has never seen you  
Has never seen trees praying.

WORCESTER, MASS.

# Equality of Representation in Congress and the Electoral College

BY J. WARREN KEIFER, M. C.

EX-SPEAKER OF THE HOUSE OF REPRESENTATIVES.

THERE appears in THE INDEPENDENT of January 18th an article in which Hon. Sydney J. Bowie, Congressman from Alabama, says, "there are two unanswerable reasons why the States of the South ought not to be punished for having reformed the suffrage."

Before examining these supposed unanswerable reasons, let us note what the writer assumes. He assumes, first, that disfranchisement has taken place in certain States; second, that to reduce representation in such States, as the Constitution of the United States requires, thereby putting them on an equality with the other States in the number of members in the House of Representatives and in the Electoral College, would be a punishment to them; and, third, that depriving citizens of proper age from the right to vote is to reform "the suffrage."

The writer says that six of the Southern States (Mississippi, South Carolina, Louisiana, North Carolina, Alabama and Virginia) have a "permanent plan now in force, and which must continue so long as the present (State) Constitutions last."

With these admissions and claims, and the facts shown by the voting statistics, we are not required to examine, critically, State constitutions, or laws, to discover how they, as administered, disfranchise substantially all the natural colored voters in the six States named, and a large number of the natural white voters.

The methods resorted to in accomplishing this disfranchisement are not important in determining whether a few voters in some States should enjoy rights in voting not possessed by voters in other States or districts of the United States. The theory of denying or abridging the right of sovereign citizens to vote to

"reform the suffrage" is the basis of all the writer says. That theory would not, in these times, be put forward by the most radical upholder of Russian autocracy. The Czar of Russia, in his October 30th, 1905, proclamation, granting representation and the elective franchise, regarded it a concession to liberty, a surrender of autocratic power, and a reform in the interest of good government and enlarged liberty.

The second section of the Fourteenth Amendment has no element of punishment in it, as the writer assumes. The principle of reduction of representation where the right of natural voters is denied, or abridged, rests on the fundamental policy of our Republic, namely, that all who are privileged to exercise the elective franchise should do it on an exact equality. The founders of the Republic upheld that principle, conceding only, in violation of it, to secure the adoption of the Constitution (about all the States then being slave States) that three-fifths of the slaves might be counted in making up representation in Congress, many then predicting that so unjust a measure would, in time, lead to slavery's overthrow, or the destruction of the Union. History has been written on that prediction. Now it is claimed that to deny, or abridge, the right of citizens to vote is to "reform the suffrage," and should give the few in a State who are allowed to vote the right to vote for the disfranchised.

The sole purpose of the second section of the Fourteenth Amendment, as shown by its history, was to require Congress to so apportion representation in the popular branch of Congress as to give the voting citizens in all the States and in districts of the same State equal political power, no more, no less. Why should South Carolina, with a white population of 557,807, and a white voting

population of 130,375, with many of the latter, as well as substantially all its colored population, disfranchised, have eleven Representatives, while Maine, New Hampshire and Delaware, with a white population of 1,256,994 (two and one-half times greater), and a white voting population of 393,096, have only the same number?

So Georgia, with a white population of 1,181,294, has eleven Representatives, and Iowa, with a white population of 2,218,667 (about double), has only the same.

South Carolina, with a white population of 557,807, has eleven members, and Colorado, with a white population of 529,046, has only three.

Mississippi, with a white population of 641,200, has eight members, and Kansas, with a white population of 1,416,319, and California, with a white population of 1,402,727 (each much more than double), each has eight members, the same. In 1904 Mississippi cast 53,337 votes for Congressmen, Kansas cast 309,949 votes and California 328,111 votes.

Other examples could be given, but these are enough here. At least fifty of the present members of the House of Representatives in Congress are apportioned on disfranchised natural voting citizens. The actual votes cast for Representatives prove conclusively the true result of disfranchisement in the six States the writer admits have largely taken away suffrage by "regulation."

The average vote for a Member of Congress in 1904 in the States of Mississippi, South Carolina and Louisiana was 7,408, while the average vote, in the same year, in a normal district, was about 40,000, and in many instances it exceeded 50,000 to the district.

It is only fair to say, the writer claims, that in the six States named 100,000 negroes have been allowed to register. It does not, however, appear how many of these were permitted to vote. There is in the six States a colored voting population of 952,851, of whom 852,851 are not permitted to register or vote.

The same laws are so enforced as to disfranchise a large part of the white population. In the same six States there is a white voting population of 1,281,719, while the total vote cast therein in 1904

was only 609,979. (All statements as to population are based on the census of 1900, when it was much less than in 1904.)

In the States of Mississippi, South Carolina and Louisiana the total vote cast in 1904 was 162,980, the white voting population in these three States being 398,783.

In 1902 Mississippi cast 18,058 votes for Congressmen, South Carolina 30,581 and Louisiana 26,265, in all 74,904. In 1872, with a much less population, the vote therein was 353,335, and the Democratic vote was 127,207 (presumably all white), largely in excess of the whole vote in later years. And the vote in 1860, when slavery existed and when the population was very much less, in Mississippi was 69,120 and in Louisiana 60,510.

In the face of these facts the writer says suffrage has not been denied or abridged within the meaning of the Fourteenth Amendment. Technical reasons for claiming that the few in the disfranchising States should exercise largely more political power in one section of the United States than in another are resorted to. What matters it to those in the non-disfranchising States who lose their equal political power what the form of the laws and the practices resorted to are to accomplish the wrong?

The question is not, how have white and colored citizens been denied the right to vote in a State, but whether the few remaining voters therein shall enjoy, in violation of the Constitution, a voting power not possessed by voters in other States?

The Amendment regards the substance; and whatever may be the law or practices, which operate to deny or abridge the right of the natural voters in a State to vote, works the same wrong and injustice to voters in other States, or districts of the same State, by giving unequal political power, the very evil intended to be prevented. The citation from Cooley falls short. To avoid such fallacious interpretation the Fourteenth Amendment provided that representation in Congress should be proportionately reduced

"when the right to vote at any election \* \* \* is denied to any male inhabitant of such State,

being twenty-one years of age \* \* \* or in any way abridged,"

A positive denial of the right to vote is not required; any abridgment of such right requires Congress to apply the remedy. If an educational qualification denies or abridges the right to vote in any State, the Amendment applies. It is said that in States having such, or like, qualifications, the number affected would not be sufficient to deprive any one State of a member of Congress. Of course, the Amendment is to be construed the same in the North as in the South.

The writer repeats thruout his article that taking away the right to vote is a "reformatory action," and that to equalize the power of the voter in electing a President or a member of the House of Representatives would be to penalize the disfranchising States; that is, to take from the few in a disfranchising State, who usurp the right to vote for the many, would have the effect to punish them or their State. To fail to do this, on the contrary, would penalize the voters of the States that did not deny or abridge the right of the natural voter to vote. No subterfuge or refinement of method can make such a wrong a right, or justify a voter in some States in exercising a political power not possessed by a voter in others.

Another has boldly met the difficulty by suggesting that Congress should not enforce the Constitution, but leave the non-disfranchising States to the remedy, open to them, of disfranchising in each State a number of natural voters equal to the number disfranchised in the offending States. This is a more honest suggestion than others which leave the inequality and injustice to continue. To resort to this as a remedy would be vicious and lead to the overthrow of universal liberty. But the Constitution plainly provides that the sole remedy for the evil is in reducing representation.

It is suggested that because the remedy has not been applied; that because wise men did not, at one time, favor its immediate application, it should not now be applied. There were statesmen who hoped that, in time, the South would so legislate and administer its laws as to render it unnecessary to enforce the constitutional provision. This proved, un-

fortunately, to be a false hope. The South continued its disfranchising more and more each year, -as the sequel has proved, and it threatens to go still further. The time is at hand to apply the remedy, and thus do justice to the whole country, and thereby promote the general interest and uphold the principle of equality on which our Union was founded. It cannot be said to be a severe application of the Constitution to so enforce it as to give voters in all the States and districts equal political power at elections. And there is nothing sectional in enforcing the Constitution, nor political, nor does it raise the race question. It is dangerous to the Republic not to enforce the Constitution, and especially those provisions which secure a republican form of government, and insure equal political power among all the citizens of the Union.

The right of a rejected voter to appeal to the courts, said to be given him in some of the disfranchising States, is a mere deception. Such appeal cannot be made effective in securing to him the right to vote at any election. If successful in the courts, he is only remitted to another attempt to vote at a future election when new methods may be adopted to reject him. What the citizen wants is the right to vote, not the right to have a law suit; nor will it do to say that because voters of a State are guaranteed the right to a fruitless litigation instead of the right to vote they have not been disfranchised.

The second point urged by the writer is, that the Amendment "merely grants to Congress the authority to reduce representation, if it sees proper," like any other grant of power, such as it possesses to pass a bankrupt law, declare war, etc.

This is new and most absurd. But, if sound, would it not be a high duty to be exercised by Congress to, at all times, so legislate as to give equal suffrage to all citizens who are allowed to enjoy suffrage?

But the right to reduce representation does not belong to a mere grant of power to Congress. It is not so classed in the Constitution. A bankrupt law may not be deemed necessary, hence none need be enacted; and war is not required to

be declared unless the exigencies of the country require it. So of all the mere grants of power to Congress.

The second section of the Fourteenth Amendment must be read as a whole. It provides for an apportionment based on the number of persons in each State, excluding Indians not taxed, with the qualification that if the right to vote

is denied to any of the male inhabitants of such State, being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion, or other crime, the basis of representation therein *shall* be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State."

The section has but one object, namely, to fix a rule of apportionment, the proviso being as binding as the part which precedes it. In other words, when there has been a denial, or abridgment, in any State, of the right of its citizens, of the class named, to vote, then such State has no right to have Representatives apportioned to it based on the whole number of persons in it. Such a State comes within the rule last provided, and is, by express terms, eliminated from the general rule. This claim does not deserve to be seriously considered. It hardly deserves to be classed with the untenable claim, sometimes put forward, that the Fifteenth, by implication, repealed the second section of the Fourteenth Amendment. Neither the language used nor the history of the two Amendments give any color to the latter claim. Repeals by implication are never favored. Those who are principally responsible for both Amendments gave us, in various ways, their interpretations of them, and by their concurrence in a law (now Section 22, R. S. U. S.), dated February 2d, 1872, passed after the Fifteenth Amendment was ratified (March 30th, 1870), which, in express terms, recognized the continuing binding force of Section 2 of the Fourteenth Amendment.

It is foreign to the question of equality of suffrage, thru which, alone, equality of American citizenship can be secured, and a republican form of government in States maintained, to complain, as does the writer, of reconstruction after the Civil War; or to say that the right of suffrage was originally left to be regulated by the States; or to say that they still possess that right subject to the limitations of the Fifteenth Amendment; or to say that the disfranchising States are now only "reforming the suffrage"; or to say that in some of such States there have been schoolhouses built "upon every hill"; that population is increasing; that illiteracy has declined; that the mileage of railroads has increased; that cotton mills have sprung up; or that banking capital has increased largely, etc. These facts testify to prosperity which could not be attained while slavery existed in the South. They testify to the improved economic conditions of freedom, and do not prove that a voter in one section should have political power not possessed by a voter in other sections of our Union. Nor is it necessary to here discuss whether or not the Fourteenth Amendment "prohibits a just and fair regulation of suffrage." Nobody claims it does; but, when regulated, the Amendment forbids those who are to enjoy it from voting for, and having representation based on, those they deem unfit to exercise the elective franchise. If unfit, this Amendment regards them unfit to be counted in apportioning representation in Congress and in the Electoral College, and denies those who, by reason of their assumed superior qualifications, do vote, the right, in effect, to vote for the disfranchised, thereby gathering to themselves a political power not possessed by voters in States that do not believe that depriving the masses of citizens of the right to freely vote and to have their votes counted, is to "reform the suffrage."

WASHINGTON, D. C.

# The Complaint of the Brook-Trout

BY IVAN SWIFT

In the silvery rivers of Dawn—  
Of the hundreds of ages ago—  
A motherhood mothered the spawn  
And gave us of freedom to grow.

We lay on the golden bars  
And laughed at the witless fly;  
We looked on the sun and the stars,  
And they came to us out of the sky.

We drank of the spears of the rain  
And wheeled in the storm-dog's ring;  
We knew of no peril or pain,  
Nor feared we a wandering thing.

The Maker of water and land  
Stood watch of our joy of the pool;  
But we fell to the rod and the hand,  
And our faith was the faith of the fool.

Barbed were the wings of the flies,  
And meshes were laid to deceive;  
The manners of man were lies  
That fish could never believe.

He came as a nature-priest,  
With book—and with hook and gun—  
But the lover of beauty was least  
And the slaughter of fish was fun!

He cast our children ashore  
For the greed of the bittern's beak;  
And he caught to his need and more—  
Pursuing from creek to creek.

And thus were we led and decoyed  
In shallow and pool and bar—  
And thus was our faith destroyed  
In mortal and sun and star!

We cherish our gift of life.  
And keep from the reach of men  
Till wiser in ways of strife—  
But *man* will be wiser then!

HARBOR SPRINGS, MICH.

## How New Zealand Controls the Distribution of Wealth

BY FLORENCE FINCH KELLY

[Mrs. Kelly has just returned from New Zealand and Australia, where she went expressly to study the workings of the radical legislation of those countries. She is a graduate of the University of Kansas, and the author of several novels and of numerous articles on sociological topics. The following article is of great present moment in view of President Roosevelt's recent speech on the limiting of colossal fortunes.—EDITOR.]

PRESIDENT ROOSEVELT'S declaration in favor of a graduated inheritance tax seems to be considered by many good people as an assumption of authority over the hand of Providence. Any interference with the laws of commercial gravity, whereby wealth attracts more wealth in propor-

tion to its mass, is believed by them to be so impious that dire calamity is bound to strike the nation that tries it. But one of the smallest and youngest of the countries of the earth has been trying for fifteen years the experiment of keeping a firm hand of control on the distribution of wealth among its citizens, and

the lightnings of an offended god of commerce have not yet struck its blooming fields and busy factories.

New Zealand has practically solved the problem of how to prevent the wealth of a prosperous country from gathering into large heaps. I have just returned from an extended trip thru the colony, and in all the time I was there I did not see, in city, town or country, a single person who did not have enough to eat and to wear, plenty of work at good pay, and the will to do it. There are no beggars, there are no tramps, there are practically no unemployed, and there are no big fortunes. There is probably no one in the islands whose wealth exceeds a million dollars, and those whose possessions amount to that much are very few. When the Liberal Government came into power fifteen years ago the colony was in a very bad way. Industrially, it was "rotten before it was ripe," as Voltaire said of the civilization of Russia. There were big landed estates and absentee owners, so that most of the wealth produced in the islands went overseas. Consequently industry had come to a standstill, and most of the workingmen had no work. Those who could get enough money together to pay their passage were leaving by the shipload, and those who could not were being cared for by the Government in shelter sheds and soup kitchens. Since those days the created wealth of the colony has increased by one hundred and twenty-two million pounds sterling, and there is no reason to suppose that, if the Government had not interfered with the commercial laws of gravity, a large part of that wealth would not have gone into the building up of big fortunes and commercial bodies more powerful than the Government.

Nearly all of the legislation that has made New Zealand a centre of interest for social and political students has dealt with one form or another of this problem of control of the distribution of wealth. The three main phases have been the management of the land question, taxation, and the control of rates and prices.

One of the first things the Liberal Government did was to inaugurate the policy of the bursting up of the big landed estates. These have been bought—compulsorily if the owners were unwill-

ing to sell—divided into small holdings and leased to actual settlers. In this was the Government has resumed over 700,000 acres. The leasehold tenure for 999 years of these lands, and also of unimproved Crown lands, and a flat rental of 4 per cent. on the unimproved valuation made it possible for any man, no matter how poor, to establish himself on a farm. Then the Government went into the business of loaning money and advanced to the settler at 5 per cent. interest, reducible to  $4\frac{1}{2}$  by prompt payment, the money needed to get himself started and make his improvements. The Government Labor Department was run in co-operation with this land policy, and it made every effort to help the unemployed to get on the land. The secretary of the Labor Department told me that he has put not less than ten thousand men on the land who otherwise could have done no better than to drift along on the perilous edge of day labor, to fall into dire straits at the first calamity. This policy has made of them independent, prosperous farmers, producers of wealth for themselves and the colony. For some years the long term lease was the favorite form of land tenure, but there is now a strong and growing sentiment in favor of the freehold, and it is probable that the Government will soon grant the right of purchase to all leaseholders. But it is determined that this shall not result in segregation of land into large holdings. Keeping the land as widely distributed as possible among the people is one of the means by which it controls the distribution of wealth. There is already a restriction upon the number of acres that may be acquired by either lease or purchase from the Crown. To forestall the danger of the building up of large estates which will come with the extension of the freehold the Government proposes to limit the amount of land that can be held by one person, by whatever title, or however acquired. The law, which the Government expects to enact at the next session of Parliament, will not affect existing titles, but will make invalid the title to any land in excess of, probably, five thousand acres which any one person may attempt to acquire.

Most systems of taxation are devised

for the purpose of providing revenue. But it is characteristic of the New Zealand idea of the functions and purposes of government that the primary intention of its scheme of direct taxation is to provide another means of combatting the tendency of wealth to flow where wealth already is. There is no property tax, and there is no tax on improvements. The land tax is on the gross salable value of the land less the value of all improvements. In addition to the ordinary land tax there is a graduated land tax which begins when the unimproved value of the land is \$25,000. Between this and \$35,000 the rate is one-eighth of a cent to the pound sterling, and above that value the rate increases by equal steps until it reaches six cents to the pound, payable when the value is a million dollars or more. Fifty per cent. additional tax is levied upon absentee owners. Holdings of small value are exempt from the ordinary land tax, the exemption amounting to \$2,500 where the unimproved value does not exceed \$7,500, and gradually diminishing up to the value of \$12,500. This is in accordance with the settled policy of the Government to make it easy for the poor and difficult for the rich to increase their possessions. The result of the exemptions and deductions is that only one-fifth of the New Zealand land owners pay a land tax. But during the last ten years the number of land tax payers has increased by 90 per cent.

The income tax is levied in conjunction with the graduated land tax, and is assessed on all income except that derived from land or from mortgages on land. This is exempt, of course, because its capital is assessed under the land tax. Incomes of less than \$1,500 are exempt from the income tax, and there is a further deduction from all incomes of \$250 yearly for life insurance premiums. The rate of the tax for last year was twelve cents on the pound for the first taxable \$5,000 and twenty-four cents on the pound for all exceeding that amount—respectively,  $2\frac{1}{2}$  and 5 per cent. The number of income tax payers is about one in one hundred of the population. They have more than doubled in the last ten years, and in that time the receipts from the income tax have

increased by 174 per cent. The Government officials think that their returns are remarkably complete, and do not believe that there is much, if any, evasion of the law. Inspecting officers verify returns at the tax payer's domicile and the commissioner can compel the production for their use of all books, balance sheets, stock sheets and other evidence of the tax payer's income. The knowledge that this will be done if necessary and the penalties attached to refusal have had a wholesome moral effect, while the careful and systematic work of the inspectors, who also give instruction to taxpayers when necessary as to the keeping of simple forms of account which will facilitate the making of returns in correct form, and the system of revision and checking by comparison in the commissioner's office, have made the law very efficient in its practical workings. The land and income tax act has been in operation since 1891, and has therefore had ample time in which to be thoroly tested. The large land holders, naturally enough, do not like the graduated land tax, but there seems to be no dissatisfaction with the income tax, in either principle or practice. I was there thru a bitterly contested political campaign, and there was no complaint of either the tax or its method of administration. Altho there was a remarkable paucity of issues it did not occur to any opposition candidate to declare that the income tax was burdensome or entailed the invasion of private rights.

The success which has attended the administration not only of these laws, but of all the New Zealand acts, appears to be due quite as much to the character of the public officials as to whatever of human righteousness may dwell in the legislation itself. Indeed, to me it seemed to be a question even more of men than of measures. Less of probity, common sense, level-headedness, human feeling and the instinct of fair play in the men who administer the laws and the colony's progressive legislation, instead of being the conspicuous success that it is would have been foredoomed to failure. To an American the purity of the public service, among both high and low officials, is a constant matter of amazement. It is my conviction, induced by

my study of conditions in the islands, that the formative effect upon the general character of the legislation of recent years, aiming as it does to prevent the accumulation of big fortunes and therefore discouraging that mad pursuit of wealth with which we are so familiar, has had much to do with this result.

Since the first imposition of the graduated land tax, fifteen years ago, the rate has been twice increased, and in his speeches during the campaign the Premier announced that it is the Government's intention to increase it again. It has had a marked effect upon the desire to own vast stretches of land. The big estates which have not been resumed by the Government are being broken up and divided among the members of a family or sold in smaller sections. And as long as the present legislation remains in force there is not the least likelihood that any more large landed properties will be formed.

The numerous commercial activities in which the New Zealand Government engages all have this same end in view, to prevent, by the regulation of rates and prices, the accumulation of big fortunes and the exploiting of labor. It goes into business, not as a monopolist, but as a competitor. The Government coal mines regulate the wholesale price of coal, and two or three weeks ago it started in as a coal dealer and established agencies for the retailing of the State mined coal. This was for the purpose of bringing down by competition the middleman's profits. Rents in New Zealand are very high, by reason, probably, of the great and rapidly increasing prosperity, which has caused something like a boom in land values. The Government is acquiring land in the suburbs of the larger cities and putting up model cottages for workmen's homes, which are to be leased at rates which will a little more than cover their cost and upkeep. When the Government went into the business of loaning money it brought down the rate of interest from 8 per cent. to the Govern-

ment rate of from  $3\frac{1}{2}$  to 5, and since then interest has never been more than 1 per cent. above the Government rate. Premier Seddon told me that there had thus been a saving to all borrowers in the colony of at least \$40,000,000. Otherwise the greater part of this money would have gone, of course, to swell the fortunes of those who were already rich. The Government has loaned to farmers, under the advances to settlers act, some \$20,000,000, and has never lost, the Premier said proudly, "so much as a five pound note." "We do not propose," he told me, "to extend State control beyond what is necessary to prevent injustice, and we do not propose at all to shut out private enterprise. We mean that capital shall perform its proper function, but that it shall not exploit labor or natural resources as it has done in older countries."

The New Zealand Government recognizes the trust, that offspring of unfettered commercial gravity, as a most potent progenitor of overgrown and cancerous fortunes, and has set its face hard against their importation or development. Asked what he would do to break up the trusts if he were President of the United States and had the same power of shaping legislation that he has in New Zealand, Premier Seddon replied, without an instant's hesitation:

"I would make it a crime to conduct trade in such a way as to create a monopoly of any necessary of life. I would make violation of anti-trust laws a criminal offense, punishable by imprisonment. It is futile to impose fines. The only adequate punishment is the disgrace of criminal conviction and the loss of personal freedom. Your Interstate Commerce law has failed to control the trusts because the Commission's decisions are not final, and the board cannot enforce the penalty of imprisonment for violation of the law. I propose to have here a board to deal with trusts and combinations in restraint of trade in food products, and there is to be no appeal from the action of that board. Upon conviction the board may impose the criminal penalty and it will have power to enforce its judgments. The plan has already been outlined and the next Parliament will probably pass the bill."

NEW YORK CITY.

# Literature

## Fiction: Romantic and Unromantic

IN their effort to interpret the spirit of the times our novelists are making the mistake of interpreting the wrong spirit. They are too much inclined to abandon the romantic manner of expression for a scandal-mongering use of facts—forgetting that facts are still the smallest, meanest part of human life, that the incredibly good things which we aspire to now only by prayers and visions shall become the high realities of the future, and that it is their honorable business to present as much as possible of what is perfect in our hopes rather than of what is monstrous, decadent and discouraging in our experience. The art which portrays a Caliban may be as excellent as that which shows the hero, but it is not so ennobling to contemplate because it suggests the wrong train of reflections. Just so, heroes, lovers and adventurers were once the most prominent people in fiction—mere creatures of the fancy, of course, to whom the reader was obliged to climb upon the stepladder of his imagination. But this was not so bad; at least it was not so bad as having to sneak down the back stairs into our meaner mind, where we usually meet the star character of an up to date story. And even when the villain committed a villainy in those elder day novels he did it in a romantic, impossible-to-imitate way, but in modern fiction it is the hero who usually commits the villainy, and nearly always in the unromantic manner of dollars and cents, which any of us can imitate to our own hurt. This is the way to change the "gentle reader" of half a century ago into the average cormorant reader of today.

And what a difference there is between the ethical young man and young woman in a modern novel and the Bayards and Madame Récamiers of older books, not that we have no Bayards and Récamiers now, but that the artistic sense we have fits another type. Gamaliel Bradford's story, *Between Two Masters*,<sup>1</sup> is an example to the point. Ethel Har-

per, the heroine, is brown, healthy, stolid, persistent, with a stride which must stretch the muscles in her flanks at every step. Every time the author brings her upon the scene the reader expects to hear her champ the bit or kick the dashboard. She has that kind of morality which comes from wholesome food, sound sleep and plenty of exercise. Then there is the paler, more intelligent young woman who engages in college settlement work. This character is always brought up thru the back alley of this kind of story, because she is predestined to save the hero from a prosperous, but dishonorable, career in Wall Street. In Mr. Bradford's novel this young man marries her and becomes the "Treasurer of the Settlement Association," with a conscience that shines out upon a naughty world with all the effulgence of a tallow candle—a sorry proverb in human nature; which lacks even the old fashioned sentiment of piety to show it off.

However, when they do mix piety with this new formula of the unromantic romance the confusion is worse confounded. There is a millionaire in Frances Hodgson Burnett's little story, *The Dawn Of Tomorrow*,<sup>2</sup> who suffers from the hypochondria of having had his greed thoroly satisfied. He is saved from committing suicide by some women of the slums in London. He is "soundly converted" upon doctrines romantic enough to satisfy anybody's imagination, and doubtless astonishing to the very angels in heaven. He is cured of his "nerves" and becomes a philanthropist ever afterward. Now, even Ida Tarbell will admit that rich men, good or bad, are philanthropists these days, but who ever heard of one being "converted"? Somehow, life itself does not furnish enough circumstantial evidence to prove that Mrs. Burnett could lead her camel thru the eye of the needle in this particular way.

And we are accustomed to laugh at Mary Austin's little feather-boned heroines, yet in those days novelists made a

<sup>1</sup> BETWEEN TWO MASTERS. By Gamaliel Bradford, Jr. Boston: Houghton, Mifflin & Co. \$1.50.

<sup>2</sup> THE DAWN OF TOMORROW. By Frances Hodgson Burnett. New York: Charles Scribner's Sons. \$1.00.

prose use of the same words which poets lifted into ballads, but now we must understand the vernacular of the Stock Exchange in order to appreciate, for instance, Henry Irving Dodge's *The Other Mr. Barclay*.<sup>3</sup> In this book there are all kinds of buying and selling of stock, with a little commercial love making between deals, but nothing happens as it ought to happen in a gambling romance, nor as things used to happen when the hero tried to "break the bank" at Monte Carlo.

Francis Lynde's *The Quickening*<sup>4</sup> is a new story of the same old good and bad in human nature. And in the beginning we feel that charm and peace of mind which comes from reading good poetry or any other happy production of the spirit and imagination, but before long the delightful little boy with his bugbear piety kicks off the chrysalis wings of his soul and becomes merely a shrewd young business man. After that it is a question of which is the sharpest rascal in the tale. The author rapes every corner of the quiet Tennessee valley of its romantic significance in his effort to establish a thriving iron industry there—a process that is called "the quickening."

But of all the ways of this prosaic modern novelist, the most exasperating is his neglect of the young people's love affairs in his stories. It is like choosing a tender title for a picture and then paint the House of Parliament instead. If, for example, the author of *Kenelm's Desire*<sup>5</sup> could have written out the idyll which the Indian hero and his white rose sweetheart were evidently capable of singing and kissing out between them, we could have spared the chapters on strikes and British Columbia politics. The idea, of course, is to whip the hero thru a riot and a campaign in order to show off his manly qualities, just as in the old days he entered the lists with his lady's glove tied to his helmet for the same purpose. But if this is the only way to prove a man now we should abandon the novel as an absurd form of portraiture, and invent a sort of literary adding machine to tick off his virtues and appraise his vices.

That it is possible to write with romantic splendor of modern life in its various phases is evidenced by Randolph Bedford's story, *The Snare of Strength*.<sup>6</sup> No more man-book has appeared since Theodore Roberts gave us "Hemming the Adventurer" in '94. There is more nature and energy in it than muck or morality, founded as it is upon those elemental forces in society from which all moralities and immoralities are evolved. The scene is laid from end to end of Australia. The author does not create a movement, and then thrust his characters into it like puppets, but they "follow the rush" from one mining camp to another, and carry the tale with them. And no matter whether the scene is of naked men and of the big sea kicking its waves upon the naked shore, or of wild hearted adventurers crowding over the long "track," it is portrayed with zest and power, and without any suggestion of neurotic sensuality. The author uses words like a man, a pioneer, a poet, but never like a muck-raker, even when he deals with the slush of polluted politics.

Another book which shows the charm and delicacy of a real romance is *If Youth But Knew!*<sup>7</sup> The scene is laid in Westphalia during the reign of Napoleon's "little brother Jerome." No abuse of the disgraceful period is omitted, but the authors have not presented them as if they were the censors of a bad government, but with a dignity and sparkle of words which change that doggerel monarchy into the rim of the great Empire tragedy. And there are lovers to grace the tale, fair figures in the heart's minuet, and there is a wandering strain of music fiddled in by Geiger Haus, which is a sort of accompaniment to the thought of the book, and lends a grace that is rarely found outside of a distinctly musical composition.

Miss McLaws's *Maid of Athens*<sup>8</sup> is a more pretentious romance, and a very feeble one. It is a pity women will not stop writing novels with Lord Byron carrying on in them. Men avoid him because they have a wisdom of life which enables them to blush before such a char-

acter. But presently some woman will reduce Don Juan's adventures to prose and never know that she has done something scandalous, because sentimental innocency is the peculiar form which idiocy takes in this kind of novelist. She has not enough sense of sex to know when she gets into a harem, and she thinks that she is being moral when she gives an historical libertine the airs of a beau-saint.

## A Genius and a Gentleman

IN the last two or three "music seasons" in New York the Russian Tchaikovsky more than any other composer has dominated the concert programs. We have had his orchestral works and his chamber pieces in profusion. And the tentative announcement has been made that next year we are to hear one of his operas. In other American cities also where music is cared for his works are performed with increasing frequency. Among the lovers of music thruout the land, who are coming to recognize in Peter Ilich Tchaikovsky the greatest symphonist since Beethoven and, next to Richard Wagner, the foremost composer of his time, the authoritative account of his life\* should find a host of readers.

It is a condensation (to one octavo volume of 780 pages) of the "colossal biography" prepared by the composer's younger brother, Modeste Tchaikovsky, which in the original Russian edition fills three volumes, running to 2,000 closely printed pages. The abridgment has been made with rare skill and well Englished by Mrs. Newmarch.

Many musicians have been industrious letter writers—Beethoven, Schumann, Mendelssohn, Wagner, Liszt, all used the pen freely for writing epistles to their friends as well as musical communications to posterity; yet none of them, perhaps, was ever so prolific of letters as Tchaikovsky. He once wrote to P. I. Jurgenson, his publisher, that he "flooded the world with his correspondence"; and his brother had more than 3,000 letters to choose from in preparing this biogra-

phy. And surely no composer ever unburdened himself so unreservedly in letters and diaries as did this Russian. He would rather write letters to them than meet and talk with his friends face to face.

Tchaikovsky's letters to his patroness, the rich widow Nadejda von Meck, form a wonderfully interesting, a profoundly moving, chapter in the life of a genius. Indeed, they constitute, perhaps, the most remarkable revelation of a great artist's aims and methods, hopes and fears, ever given to the world. They tell not alone of his methods of composition, of the ideas and emotions he elaborated in his music, but as well of his habits of life and thought, of his delights in the music of others, in travel, in country landscapes, in painting, in literature (and of his dislikes also), of his religion and of his philosophy. They contain frank and free criticism of his contemporaries, both Russian and foreign, and they give Tchaikovsky's appraisements of the classic masters.

The letters to other friends and to the members of his family are scarcely less engrossing. Especially interesting to American readers is the record of his visit to this country in 1891, to assist at the opening of Carnegie Hall in New York. In the diary of the journey which he kept for his brother he set down with the utmost frankness his impressions of persons and places, and told how he was pestered, bored, irritated, amused, entertained and delighted by various people and experiences. He saw much that amazed him, and was well nigh overwhelmed by American hospitality, but registered an honest liking for "most of the American ways and customs." Mr. Carnegie inspired the composer "with unusual confidence" and delighted him by a droll imitation of his conducting.

Tchaikovsky spoke in music because he had something to say. He wrote from an irresistible inward impulse. His work was sincere. Yet he had his moods of doubt about his own powers. The portrait the book presents is that of a complex personality: a musician of rather narrow sympathies, yet an artist of open mind, sensitive to the most fleeting suggestion of beauty; in Russia a cultured

\* THE LIFE AND LETTERS OF PETER ILICH TCHAIKOVSKY. By Modeste Tchaikovsky. Edited from the Russian, with an introduction by Rosa Newmarch. New York: John Lane Co. \$5.00.

cosmopolite, and away from home an intensely patriotic Russian suffering the bitterest pangs of nostalgia; an absolutely honest, candid, ingenuous idealist—pure minded and noble hearted, and a man of inexpressible charm and haunting pathos; unmistakably a towering genius—and a modest gentleman.

## Old Testament Criticism

PROFESSOR KENT deserves no little credit for his industry and skill in popularizing the results of the critical study of the Old Testament. His "History of the Hebrew People" was one of the first books to appear in English showing the effect of the higher criticism upon the construction of Jewish history, and the *Student's Old Testament*<sup>1</sup> offers the best ready comprehension of the documentary theory of the Hexateuch and the literary structure of the historical books. The present volume is also popular, not advocating new views nor justifying at length the positions held, but describing and making clear the opinions of scholars as to the literature, the history and the religion of the Hebrew people. It is taken for granted that there are assured results in Old Testament criticism—e. g., that the priestly laws of Leviticus are exilic and post-exilic, a late excrescence of Hebrew piety rather than its foundation, that besides a priestly document a Judæan prophetic history (J) and an Ephraimitic narrative (E) can be distinguished in the Hexateuch. The reasons for these opinions are stated in brief, with quiet assurance, as if a demur would be rude.

Of the Old Testament as understood by the higher criticism Professor Kent is an enthusiastic teacher. He feels impelled to proclaim on the housetops the re-discovery of the vital truth and abiding worth of the Hebrew Scriptures. He writes for busy ministers, missionaries and Sunday school teachers, and his best chapters are on reforms in religious education thru application of the newer views. The book is not thoro, is to be read rather than studied or used for reference, and, as the author says, is sim-

ply a "very informal introduction" to careful investigation, which it seeks to encourage. For this purpose it is excellent.

While Professor Kent was hurrying together the manuscript of his book (he tells us it was written during the last Christmas vacation), a work was in press which was to challenge boldly both the critical positions he had assumed as established and also the value and religious significance of the Old Testament as criticism interprets it. This challenge to present opinion in this field is Professor Orr's *Problem of the Old Testament*,<sup>2</sup> a work which has received the Bross prize of \$6,000 administered by Lake Forest College as the book best calculated to "demonstrate the divine origin and authority of the Christian Scriptures." It may be noted that the writer who receives this honor has gone outside his own field, which is that of systematic theology, and that his views admittedly and purposely run counter to the almost unanimous conclusions of specialists in the field he has lately entered. The achievement is as great as if a well known bacteriologist should produce a work on surgery controverting the entire trend in surgical practice in the last fifty years, and then receive a prize for best promoting surgical science! To carry on the parallel we would need to imagine the surgical specialists merely smiling and proceeding with their operations as they had before been accustomed.

For Professor Orr has changed the situation as to the Old Testament not a particle.—His pages bristle with references, especially to the German literature of the subject, and his industry has been enormous. His book is valuable, if, for no other reason, for its collection of opinions and multiplied citations from writers of all schools. He is skilful in pointing out differences among critics, and in holding up to ridicule untenable conjectures and unwarranted conclusions. But when the case is all heard and every argument well considered, the most that can be admitted is that some results thought probable have been shown to be difficult of proof, while the main

<sup>1</sup> THE ORIGIN AND PERMANENT VALUE OF THE OLD TESTAMENT. By Charles Foster Kent. New York: Charles Scribner's Sons. \$1.00.

<sup>2</sup> THE PROBLEM OF THE OLD TESTAMENT, <sup>6</sup> CONSIDERED WITH REFERENCE TO RECENT CRITICISM. By James Orr. New York: Charles Scribner's Sons. \$1.50.

positions to which students have painfully beaten their way are firmer and stronger than ever. It is difficult to see how a stronger case against the critical position can be made out than is presented in this volume. Professor Orr is astute, a keen logician, and he has made himself a thoro master of his material. He dodges no issue, but meets his opponents at every point. But when he is finished, one remembers the rude religious practices of the times of the Judges, by the best men of those times and without rebuke from any one, Gideon's ephod and Micah's idol, and the religious history proposed by Professor Orr, with its *Blüthezeit* in the Mosaic age, is altogether incredible. After all special pleading that there must have been *some* cult of sacrifice and offering in the period of the wanderings and the monarchy, the dating of the Levitical legislation before Samuel sacrificed on the high place of his little village and Elijah built the altar on Carmel is still impossible. Professor Orr's case breaks down on examination in detail. For example, his assertion that to Amos there was but one legitimate sanctuary on the basis of the second verse of the prophecy is of a piece with the proof text method of the Westminster Catechism, and his idea that Amos defamed against Bethel on liturgical grounds is no better. We have not the space to take up questions in detail, and it must suffice to say that after careful examination of Professor Orr's argument, the main features of the Graf-Wellhausen position—the late date of the priest's code, the creative function of the prophets in Israelitish religion, the Josian date of Deuteronomy—appear as firmly established as ever.

The reactionary in purpose Professor Orr's essay reveals clearly what remarkable progress has been made of late by the higher criticism of the Old Testament. The advance since the time of the debate between Professor Green and President Harper over the documentary composition of the Hexateuch is notable. It is safe to accept Professor Orr's prize essay as the most strenuous, rational defense of conservative views in regard to the Old Testament that could be made at the present time. Yet consider how

much is admitted which higher critics have advocated and which conservatives have opposed. The documentary theory of the Hexateuch is accepted in part: the "priest's code" is spoken of as freely as in Driver or Gunkel, and it is declared that the "separation of the Elohist sections of Genesis (P) has stood the test of time, and will not be overturned." The Mosaic authorship of the Pentateuch is not affirmed on the basis of Jesus's word that "Moses wrote"; on the contrary, it is said that "the work shows very evident signs of different pens and styles, of editorial redaction, of stages of compilation." It is freely admitted that "Chronicles can only take secondary rank as a historical authority in comparison with Samuel and Kings." The effort to find "minute inerrancy in external details, as those of geography, or chronology, or physical science" is discouraged. It is not long since such admissions would have been counted dangerous. Their appearance on the pages of a doughty champion of the conservative position shows how far forward we have really come. Dr. Orr endeavors to be fair, and he is certainly painstaking. There are few, however, who could study with equal zeal and candor the modern criticism of the Old Testament and accord to its conclusions so small a measure of truth.

**Sir Thomas Browne.** By Edmund Gosse. English Men of Letters. New York: The Macmillan Co. 75 cents.

Mr. Gosse's account of Sir Thomas Browne is not particularly interesting. As a series the "English Men of Letters" is well conceived and in general well executed; but the harvest has been pretty well reaped already and the gleaners have been at work for some time. The result is a number of volumes well enough in themselves, but of inferior attractions and in reality of another denomination as compared with those which have given the series its reputation. The author of "Religio Medici" has a kind of interest and significance no doubt; but his interest is "literary" rather than lively or popular and his significance is largely relative. He should be written about with "curious care" by some one with an exquisite relish of his

"preciousness" and a style as exquisitely adapted to the subject, some one like Stevenson, for instance; or else by some comparative anatomist of the human spirit alive to his contrast with Montaigne and Pascal, who elbow him on one side and the other. But altho Mr. Gosse professes himself greatly Browne's admirer, yet in neither particular is his criticism very penetrating and suggestive, whether with respect to his author's manner or matter. But then in the case of such a man the rather mechanical touch of a general series is not likely to be particularly happy.

### Literary Notes

....The great peace novel of the Baroness von Suttner, "*Die Waffen Nieder*," which received the Nobel Prize last year as the most effective agency in the promotion of the world's peace, is published by A. C. McClurg & Co., Chicago, at \$1.25, under the title of "Ground Arms," a translation by Alice Asbury Abbott. It is something of an imposition upon the public to publish a fragmentary translation like this without any intimation that it is not a complete reproduction of the original. Parts of sentences, paragraphs and whole pages are cut out, and what is left is run together in such a way as to conceal the omissions as far as possible. The authorized translation of the complete work by T. Holmes, published by Longmans, Green & Co., contains about 164,000 words. The McClurg edition contains about 103,000, that is, more than a third of the original has been extirpated.

....We, too, have the same question often asked of us which Prof. R. W. Rogers answers in *The Sunday School Times*, and his answer is good. The books he recommends to those who want to know what books to read or study about Oriental archeology, the discoveries in the East. He suggests the following: Prof. Ira M. Price's "The Monuments and the Old Testament"; Prof. A. H. Sayce's "Fresh Light From Ancient Monuments"; T. G. Pinches' "The Old Testament in the Light of the Historical Records and Legends of Assyria and Babylonia"; D. G. Hogarth's "Authority and Archeology, Sacred and Profane"; C. J. Ball's "Light From the East"; H. V. Hilprecht's "Explorations in Bible Lands"; Sayce's "The Higher Criticism and the Verdict of the Monuments," and his "Patriarchal Palestine"; Breasted's "History of Egypt From the Earliest Times to the Persian Conquest"; R. W. Rogers's "History of Babylonia and Assyria"; George S. Goodspeed's "History of the Ancient World"; L. B. Paton's "Early History of Syria and Palestine," and James F. McCurdy's "History, Prophecy and the Monuments." To these, if enthusiasm and money allow, might well be added the three large illustrated volumes by Maspero, of which the first is "The Dawn of

the Nations," and Perrot and Chipiez's series of richly illustrated volumes on Assyria, Palestine, Syria, and the East generally.

### Pebbles

BOGGS—Blinks is crazy over liquor.

Foggs—Yes, he's saloonatic.

—*Harvard Lampoon*.

"THEY don't give the runners much to eat at this training table."

"No, they are making them fast."—*Princeton Tiger*.

A CHIEF of bureau in the Navy Department tells a good story of the time when one of the Secretaries of the Navy got the notion into his head that officers should not permit their wives to reside at the foreign stations to which their husbands might be attached. So an order to that effect was promulgated. Soon thereafter considerable perplexity and no little amusement was afforded the Secretary when he received the following cablegram from Commodore Fyffe, then in command of the Asiatic Squadron:

"*Secretary Navy, Washington*:

"It becomes my painful duty to report that my wife, Eliza Fyffe, has, in disobedience to my orders, and in the face of regulations of department, taken up her residence on the station, and persistently refuses to leave."—*Army and Navy Journal*.

### MY FAIR AURORA.

OH, the sun was shining softly thru the moonlight

On the rice fields of my old Nebraska home,  
While o'er the level mountains of Kanawa

Came the crashing of the silent ocean foam.  
For the wind was lightly humming thru the nettles,

And the oranges were swinging on the vine,  
When I told my fair Aurora that I loved her  
And she softly answered that she would be mine.

Then I gazed into her eyes with heavenly rapture

As we walked together o'er the yellow lawn,  
While the August snow was beating on the housetops

And the crocodiles were flitting thru the corn,

As the river slowly glided up the hillside

And cast its shadow o'er the waving grain,

Within my loving arms I softly held her

And knew at last I had not lived in vain.

And even now the mention of Kanawa

Brings up memories of that long-forgotten day,

And again I see the murmur of the reindeer

And hear the starlight shine upon the hay.

So if I were a seagull (or a chicken)

I'd fly across to yon far-distant shore,

To Kanawa, where the butterflies are singing

And Aurora lies beneath the sycamore.

—*Princeton Tiger*.

## Midsummer Night's Dream

THE moon was automobiling its way among the ivory clouds at nine o'clock. At ten the sky was dark blue and the stars but half lighted—out of respect to the queen of the night. Now one could see that the moon was made to go with the country, for it filled the valley full to the brim, weaving poems out of the commonest things, and hanging fairy legends over shrubs and trees. What are the winds about, except lifting the limbs to let the moon see the violets?

Night folk are coming out, for the world has a different set of inhabitants after dark. Toads hop everywhere, harvesting lightning bugs. Bees, who generally go to bed at sunset, are buzzing a busy tune up in the basswood trees, making honey by moonshine. A bat comes round and round, in great circles that cut each other, catching his lunch of beautiful moths, and now and then emitting a bit of a squeak—not quite musical. Bats are by no means ill omened; only they are neither this nor that—not quite bird and not quite quadruped; and folks are afraid of these cross roads creatures—illy defined and slightly mysterious.

The odors of midnight are its own. The fragrance of day flowers is to attract butterflies; but butterflies are now dreaming inside hollyhock blossoms. Moths are flying, and they love an entirely different octave of sweets. The primroses are popping open by the roadside, in their hurry to see the moon and to let loose their hearts full of incense. There is nothing in this world so utterly satisfying as a bush of old fashioned honeysuckle; but it must be enjoyed by night, for all day it is only beautiful, but it is not sweet. After dew fall it makes the senses drunk with its honeyed odor. No artist ever conceived so rich and romantic a picture as one of these, given us by nature in the wooded lawn, at midnight. Great patches of gold are spread, like mats, under the trees; others, reaching thru the shrubbery and trees, turn an open space into a small day. There are no two kinds of trees that let the moonlight thru after the same manner. Sifted

down thru the delicate locust foliage, the silvery light bewitches the air and plays on the grass spears. Here, thru the pines, it drops freely and rests quietly on the sod. It slides off the maple leaves all over the rose bed; but under the tree itself it leaves blackness. Each rose nods and laughs, and on its stem blushes a deeper crimson. If you will look down over the meadows there is certainly a marvelous congress of daisies and big headed clover and timothy tops. What the conference is about no one can tell; but the population of a meadow is beyond estimate. The fireflies, like lamps, are strung about on the tallest grasses, or carry their light about to serve the fairies. Under the orchard trees there is, moving about, a breeze that sways with the young apples, and now and then snatches off a would be pippin.

It is all curious everywhere, and now the scenes and the sounds compound themselves into a great mystery. You are awestruck when you try to adjust yourself to this night world. You are wondering if there really be two worlds; or if this night world be the real one, with its hints, and dreams, and whispers, and fairies; or if the day be real, with its sharp outlines and its facts. One must listen very discreetly to get at the sounds of deep night. They are all buried in that which at first seems to your senses to be silence. But you will slowly analyze, until one sound becomes distinct—picked out of the full harmony; and then another, until at last you find that the silence is by no means a vacuity, a negative, but is a very perfect fitting together of many sounds. You find that the whole air is completely full of a great fugue of tree toads; then there is a sharper and distinct sound of crickets rising up everywhere from the moist spots; and then out of the tangled skeins you pull another rasping call of katydids—and all these are so keyed to each other that they make a unity, more complete than anything that occurs during the sunlight.

A wakeful catbird, taking in the melowness of the night, sends up from his sly syringa bush a soft, low song, full

of interrogation—possibly of bird prayer. We whistle back a low postlude, not to interrupt, for he knows the whistler as we know him, and he whistles back another trill of bird music, such as never before dropped out of a bush into a soul. It would be better to be a poet than an editor, and then our beautiful singers' sweetness could find translation into human speech. What are we good for, if we cannot vocalize the world about us? The painter, with brushes and pigments, stands nowhere near the artist who can paint with words. Speech, after all, is the one wonderful mystery of the world, where everything is struggling to find utterance.

It startles us to find that, after all, we are not alone in this midnight world of ours. The whistle of a boy comes up to us from far down in the valley by the creek. Suddenly he snaps off his fugue, for evidently he has had a bite, and you find yourself hoping that he has landed his fish—for your breakfast and his. The moon tolerates fishing, but it forbids hunting anything but coons and woodchucks. These fellows eat and break down our corn, and they must take their chances. But fishing is, in and of itself, a dream, a mystery. It does not welcome human companionship. And then what shadows there are on the water! What a witching play of fretted pictures, cast by the willows and the elms! What would become of our imagination if the whole round day were lighted with sunshine? Yet it is the imagination that guides us, and makes us, more than it is the reason. That low whistle from the creek side has now in it a distinct chuckle. That boy is having luck. He has got his fish and is getting more.

The village clock strikes one and we are drowsy. It occurs to us that, after all, we are intruders in this realm of the romantic and mysterious. We will retire to that unromantic realm, the indoors, giving our senses over to sleep. We belong to the practical world—the money-making, which is full of fret and care. In the morning we shall waken, and shall hear the shout of the hay makers. Then will we know no more of this sweet realm of the invisible, and to us it will be as if it were not; and yet our midsummer night's dream is a better and

truer fact than the toil life, that ends nowhere but in unusable piles of wealth and dissatisfaction.

### What a College Boy Should Know

FIFTY years ago it would have been an easy matter to say what a college boy should know. Colleges in those days were as much like one another as so many white beans. The curriculum was practically the same in all. A good deal of Latin and Greek, a considerable amount of mathematics, and Olmsted's "Natural Philosophy," "The Federalist," and as much "metaphysics" as could be extracted from somebody's thin volume on the human mind, and as much natural theology as could be obtained from Butler's "Analogy" made up the great essentials of a liberal education. The bill of fare looks poor to us of to-day, yet, somehow, the college training of that time did make liberally educated men. And the secret of it was that the Greek and Latin authors opened up to every boy who really studied them a great and beautiful world of history, of ideas, of noble inspirations. Greece and Rome attained the heights of civilization. Rome witnessed the struggle between pagan and Christian ideals. The boy who read even imperfectly the epics, the tragedies and the histories of the great Greek and Roman authors knew something, however superficially, however imperfectly, of the things that in those days were best worth knowing: something of human motives, as interpreted in literature and art, something of human achievement, something of the great problems of political organization and social well being. Whether or not he was well equipped for a business career, he was in some measure equipped for the life of a citizen.

The half century that has intervened since the day of those old colleges has revealed a new universe. It has witnessed the creation of science in the modern sense of the word. It has witnessed also the creation of a vast realm of technical knowledge. More and more these new interests have drawn men's minds from the older studies of liberal culture. Especially has technical knowledge, with its

alluring promise of material power, called youth to itself and led them thru early specialization to narrow their intellectual interests. This tendency has reacted upon both educational aims and educational methods. The impossibility of mastering the present multiplicity of sciences, disciplines and arts has resulted in a frank recognition of the claims of all subjects, and in an attempt to secure a measure of thoroughness by encouraging an election of courses, and a technical thoroughness in pursuing them.

In all this it is easy to find much to commend. But it is easy also to find much to deplore. It is possible for the college boy today to obtain his bachelor's degree for proficiency in studies which have thrown upon his mind not one glimmer of that light which disclosed to our fathers the glorious realm of humane interests. From the alumni associations of our American colleges we could probably pick out ten thousand young men who are wholly ignorant of those contributions which the civilizations of Greece and Rome made to the general intellectual and political equipment of mankind. To those who are happy in their ignorance of these things this may not seem much to matter. Yet it does matter, and so does the further fact that it would be just as easy to pick out ten thousand alumni who, in this scientific age, are entirely ignorant of the specific ideas that constitute our modern scientific conception of the physical universe. They have heard of Darwin, of Helmholtz and of Curie, but they have never read a paragraph of their writings, and could not possibly give an account of one of their discoveries. In school and in college these young men have been ordinarily diligent. They have attended lectures, crammed text books and passed examinations. They have done a little work in physical and biological laboratories and dabbled a bit in psychology. In English literature they have read selections and "courses," tho not all of them have learned how to write sentences that could be parsed. In short, they have mastered a great deal of knowledge of a kind, while successfully escaping all that knowledge which ought most to interest a really cultivated mind.

To the modern educator our sugges-

tion may seem quite old fashioned and absurd, but we must offer it. We insist that a college boy ought to know why intelligent and liberally educated men have standards of discrimination in poetry and in art. To that end he should know by actual study something of the difference between Homer and our current magazine verse. He should know the difference between tragedy or comedy, in the Greek sense of the words, and the successes of the season in our Broadway theaters. He should know how it happened that intelligent men came ever to be interested in the problems of political philosophy, and what progress they have made in dealing with them since Thucydides and Aristotle made their contribution to these topics. He should know what the modern physical theory of matter and energy is, what the theory of evolution is, and why scientific men accept it.

We are glad to have the college boy know a lot of things that "lead to a degree." Some of them doubtless are very well worth knowing. But, in the interest of the general intelligence of mankind, we should be glad if he could find time before he is twenty-three years old to acquire as much of real outlook upon life and the world as he might reasonably be expected to get from a reading of any fairly good translation of the Iliad, from Jowett's Thucydides, from one or two of Huxley's essays, and from Darwin's "Origin of Species." So much of liberal education really wouldn't hurt him.

### Is the Problem Insoluble?

MR. WILLIAM F. BAILEY, Irish Land Commissioner, who has been studying conditions in the United States, concludes a discussion of our "Negro Problem," in *The Fortnightly Review*, with these alarming words:

"The problem seems insoluble. The position every day seems to become more acute. The white man becomes more irritable and less disposed to tolerate the assumption of equality made by his colored neighbor, who at the same time becomes more and more restive under social and political conditions that he regards as unjust and degrading. The white man of the Northern States is troubled, confused, and suspends his judgment. He does not like the negro one bit better than does the Southern.

In that, of the two, the attitude of the South is more kindly so long as he is not asked to admit equality. So far as we can see at present the position will grow steadily worse and worse until it becomes intolerable, and a savage racial contest will furnish another commentary on the depth and meaning of Western civilization. Perhaps the negro will produce a powerful and capable leader—a man of world force—who will lift his people out of their bondage by political movement or social war."

Is the problem so insoluble?

It certainly ought not to be. If civilization cannot solve it, Christianity ought to be able to. Christianity is a failure if it cannot solve any moral or social problem.

But what is the problem?

It is, how to produce a social and political equilibrium between one body of people, more or less black, who want to rise to a position of equal privilege and right, and another body of people, living in the same regions, who are determined to exclude them from equal privilege and right.

Now, there are only two ways to secure this equilibrium. One is for the excluded people to desist, either by compulsion or by discouragement, from seeking equal privilege and right, or for the privileged people to cease attempting to exclude them. There is absolutely no other solution. There was equilibrium in slavery times, because the negro was so held down that he could do nothing. The volcano was capped till 1863. Since then the negro has been steadily rising, and is, every year, less and less satisfied to be excluded from equal privilege and right, and is likely to be less and less satisfied, so that we can hardly expect him to be discouraged and to consent to a patient equilibrium under existing conditions.

Then, there remains the other solution, namely, that the white people shall yield and allow equal privileges and rights to negroes. If that is refused we fail to see why Mr. Bailey's dismal outlook is not justified, which is that also of John Morley. Will they yield?

We believe they will—in time, because it is right that they should, and because they cannot help it. Of course they protest that they never will. It would be most amusing, if it were not tragic, to read the editorials in the rival Democratic papers in Georgia, just now each

trying to exceed its rival in urgency for the suppression of negro suffrage. Whether it be the organ of Clark Howell's candidacy for the Governorship, or that of Hoke Smith, each charges the other with being the less emphatic in denunciation and exclusion of negro suffrage. That much is assumed on both sides, that only white people can vote, and they differ only as to what is the best way to shut out negroes. And yet we seem to see and hear in it all that stage fury, that theatrical display of surface passion, which allows for a change of attitude when called for. Thus we recall that a dozen years ago Tom Watson, who is now supporting Hoke Smith, was calling on the negroes to vote for him—and there were then three times as many negroes enrolled as now. And he said:

"This Republic will never reach its true grandeur so long as a dead line is drawn between one section and another, one color and another. . . .

"When it comes to matters of law and justice, I despise the Anglo-Saxon who is such an infernal coward as to deny equal rights to any man on account of his color, for fear of 'negro domination.' . . .

"What words can paint the cowardice of the Anglo-Saxon who would deny equal and exact justice to the ignorant, helpless, poverty-cursed negro in whose ears the clank of chains have scarcely ceased domination. Away with such contemptible timidity of counsel!"

That language expresses decent common sense; but they are not talking that way now in Georgia, because they have not two fighting white parties, as they had then. But the time will come again when the votes of negroes will be wanted, and then they will be sought and be counted.

Besides, the negroes will more and more insistently demand their rights, and the white people know, in the bottom of their hearts, that these are rights and should be allowed. More and more of them will conclude to yield what is right. Right has a way of prevailing ultimately. There are negroes who believe in long patience, in ceasing to demand suffrage for fear of giving offence, but the younger generation, those that have had as good an education as their white neighbors, often a better one, will insist until they get their rights. The patient generation of "good niggers" is passing by, the ones who love to be submissive

servants, and self-reliant men are taking their place. Equally there is a new generation of white men who are thinking larger thoughts, less sectional, than the thoughts of their fathers. The sense of justice to all is spreading and will spread more, and that means peace and better relations between the colors. We believe we have passed the worst in this matter, and that, as lynchings are fewer, and the sense of law improved, so human rights will be more recognized and allowed.

But if not—and we hardly dare to anticipate the alternative—the prognostication of John Morley and Mr. Bailey will come true, and the result will be terrible; for the volcano cannot be capped always, when the internal fires are increasing in intensity. Every school kindles it, and every ambition overflows.

### Suspiciousness as a Christian Virtue

ONCE more the Southern General Assembly hesitates. That has been its long attitude. Thirty years ago, when the Northern General Assembly met in Brooklyn, under Dr. Henry J. Van Dyke as Moderator, a proposal went to the Southern Assembly for the consideration of union, and the subject has been brought up often since, but always the Southern Assembly has hesitated. It is suspicious; it fears the gifts of the Greeks.

And once more it hesitates. There have been committees at work on a plan for a closer federation of the Reformed Churches of the United States holding the Presbyterian form of government, and very excellent and satisfactory their conclusion seemed. Doubtless every other Presbyterian denomination approves, excepting, of course, the Cumberland Presbyterian, which was not satisfied because it wanted, and accomplished, something closer. But the Southern Presbyterians were suspicious. They feared some African in the woodpile. They had been equally suspicious a year ago, when the proposal was to send delegates to organize an Inter-Church Federation. They smelt in it some interference or control or loss of independence,

and they were the only denomination that was unwilling to take part. But those denominations that put Christian confidence in their Christian brethren went forward and made a great success of the effort. So now these same Southern Presbyterians were afraid of their Northern brethren. Perhaps, they said, our brethren mean well; perhaps they are not contriving to swallow us up, or to infect us with yellow fever heresy; but who knows? So they declined to act, and sent the matter down to the Presbyteries for their watchful consideration.

Prudence is a virtue; but suspiciousness is not. The presumption is that good people mean good. It is true that lack of prudence ruins many men and many plans; but the spirit of suspicion costs very nearly as much. That is half of the fault called want of tact. One may properly be on constant guard against bad men or vile causes; but the spirit of generous faith in men known to have a good purpose and good intelligence is an essential to success. Mr. Carnegie wants it put on his monument that he knew how to find and trust men that could do things better than he could. Faith is a virtue as between men, as well as between a man and his God; and much more should it be a virtue between Christian bodies.

If our Lord prayed for the time when all should be one, his prayer implied their confidence in each other. It is this suspiciousness that has created all the schisms in the Church, and that maintains schisms. If one now prays to be delivered from schism he prays for more confidence and less suspiciousness. The prayer will not be answered until the Southern Presbyterian Church and other churches conquer this vice.

What had the Southern Presbyterians to fear? The minority report of the committee on the subject presented to the Assembly, six against seven, expressed the fear that the adoption of the Charlotte agreement would result in sure sacrifice of the independence of the Church. That is what the suspicious people are always fearing. They are thinking of how they may protect themselves, when they ought to be thinking of how they might love and help somebody else. What the Southern Presbyterians need

is more faith, which is another way of saying more religion.

### Co-operative Clothing

THE most detailed of socialistic utopias is that planned by Fourier, and among his numerous ingenious contrivances for promoting, or rather, compelling co-operation is the provision that the clothing of both men and women shall be so fastened behind that no one shall be able to dress alone; the idea being that where the members of the community were obliged to ask assistance of each other every day in such a simple matter as dressing they would have constantly impressed upon their minds the necessity for co-operation in larger things. The founder of one of the great monastic orders designed its garb in the same inconvenient fashion with the object of training the friars in the Christian virtues of humility, dependence and mutual helpfulness. Martin Luther objected to his wife's waist because it fastened in front. Independence in women is unseemly, he said, they should need assistance in dressing.

An idea thus common to such opposing schools of thought as Catholicism, Protestantism and Socialism, should be worthy of attention, and may raise the question to which of these influences do we owe the present fashion in the clothing of women, that compels her to seek a greater degree of assistance than has been necessary hitherto. Our fashions in dress are supposed to originate in France, where Protestantism is a small factor, and Catholicism is losing ground, so of the three we would have most reason to suspect the Socialists of a plot to weaken the excessive individualism of bourgeoisie and so prepare the way for co-operation on a larger scale. Socialists have been detected in the French arsenals, filling cartridges with sand instead of powder in their zeal to make war impossible, so it is not inconceivable that there are Parisian modistes of advanced views who wish to convert their sex, esteemed unduly conservative, by the introduction of a costume of collectivist tendency. Or, to put the case in other words, the Rue Royale has determined to overthrow Wall Street, in-

stead of merely robbing it, as formerly. If the reader does not fancy this explanation there are plenty of others, equally improbable, for him to choose from. It may be that the back-buttoned waist was invented by some foe of the emancipation of women, who wished to make wives appreciate their husbands more, and bring bachelor maids to a realization of the fact that a man is a handy thing to have in the house. Or it may be that the women have adopted it to prove that the zoologists are wrong in classifying them with the lower animals in the natural order mammalia. No explanation is to be rejected on the ground of its absurdity, for the costume itself is so absurd that only a very absurd reason can adequately account for it.

The observable results of the fashion are very curious, differing, as, of course, they do with the temperament of the individual. No doubt there is a considerable strain upon the temper, but this does not show itself in such violence of language as would be the case if a like burden had been placed upon the back of man. The fashion is conducive to the cultivation of acquaintances. Ladies in hotels and apartment houses come to recognize the existence and usefulness of bell and elevator boys. Instances are known of ladies who have for years occupied adjoining rooms and turned their backs upon each other in disdain whenever they met in the hall, but who are now good friends. They turn their backs upon each other as before, but the motive is different, and it is the motive that determines the quality of an act.

The fashion in shirt waists is also a cure for absent-mindedness. A woman may have a great deal of forethought, but unless she is also endowed with the opposite kind of thought she is apt to go upon the street in a state which impresses the observer with a sense of incompleteness, like a strain of music with the last chord unplayed. The budding rose, the ear of corn bursting from its silk-lined sheath, a butterfly about to emerge from its chrysalis, such are some of the poetical similes that throng to the imagination of one who sits behind her on the street car.

Punctuality, it is to be feared, is not one of the virtues promoted by the fash-

ion, for in dressing nowadays it is advantageous to be a little behind hand.

The socialistic shirt waist would fail of its effect if all women had maids, but servants are now becoming unattainable. It is felt that personal services performed for pay is degrading, as is shown by the persistence of tipping where this relationship prevails, but an exchange of services between equals promotes the spirit of kindliness. If now some way could be devised by which millionaires could be compelled to black each other's shoes, it would be a great step toward the establishment of the co-operative commonwealth.

The arrogance of the self-made man is only equaled by the pride of a self-dressed woman. But a heavy penalty is now visited upon the woman who wants to be independent. One independent young lady last week broke her arm trying to reach the missing link in the back of her dress, and now, with her arm in a sling, she is more dependent than ever. The Chinese have devised ingeniously carved ivory claws to reach that same inaccessible spot. It may be that some manufacturer will put a long handled back buttoner on the market, and thus again capitalism will crush the rising spirit of co-operation.

No athletic training will overcome the disadvantages of the prevailing fashion. All hope of that disappeared when it was disclosed by the press agent that the female contortionist in the greatest show on earth was obliged to have some one else fasten her waist behind. Ambidexterity may be cultivated, but nothing can be done to make the back as accessible as the front. There is bilateral symmetry in only one of the infinite number of planes which may be passed, without hurting him, thru the perpendicular axis of a human being. This anatomical fact was expressed, not so scientifically, but perhaps even more forcibly, by the little girl who, when scolded for coming to the breakfast table with her apron unbuttoned in the back, replied: "How could I button it? I am in front."

Reaching after the unattainable is, by all moralists, acknowledged to be the most beneficial of exercises. It is, then, perhaps well that the seventh dorsal vertebra should remain, like the South

Pole, the center of the largest unexplored region on the human body, and that generation after generation should attempt to reach it and perish without attaining their object. In Lamarkian evolution there is hope. Let us think of

"the buffalo calf,  
That by stretching and stretching  
Became a giraffe."

## Corporations and the Public

IN this season of baccalaureate sermons, commencement addresses and other public utterances of the kind, we are getting an interesting assortment of opinions upon the topics of the time. Muck-raking is one of these topics of which every speaker has something to say. Exposure of wrongdoing in great corporations is considered from various points of view. A majority find something to commend in the work of investigators who have brought hidden offenses to light; a few attack the investigators with some heat. There are speakers who do not see that the most effective muck-rakers in the last twelve months have been the Armstrong Insurance Committee, the Interstate Commerce Commission and the Congress of the United States, that set this Commission at work. There are some, like Chancellor Day, who are quite obviously under the influence of an association with persons whom muck-rakers have disturbed.

It is encouraging to see that the speakers of the time, as a rule, are optimistic, believing that exposure must be beneficial. There is also encouragement in the sharp and substantially uniform criticism, by the American press, of those who seem to prefer that wrongdoing shall remain concealed and go unpunished.

On the 13th inst. there were made in the West two addresses that illustrate the wide range of opinion in this discussion. Mr. Armstrong, formerly Assistant Secretary of the Treasury and now president of the Casualty Company of America (in New York), spoke about corporations and recent legislation to a bankers' association in Iowa. "It is the fashion today," said he, "to indiscrim-

mately and persistently attack every form of co-operated capital, to assail all corporations, regardless of management, regardless of results, regardless of the future, and with the irresponsibility of speech and action that denotes the radical and unthinking. It is this indiscriminate assault upon capital wherever co-operated that is producing today, in the most glorious era of prosperity ever known to a civilized people, a feeling of vague unrest." Wrongdoing and mismanagement had been discovered in some quarters, he continued, and they should be severely punished; but the sinning corporations were rare exceptions. He predicted that some day we should lose our prosperity, owing to "unwarranted, continuous attacks upon every instrument of progress and development which has made this country great." "Copious legislation," he added, "has been produced in the last six months to reform this or regulate that. Much of it has been drastic, some of it exceedingly good, some of it bad, much of it impractical."

It seems to us that this speaker has misinterpreted the attitude of the public toward corporations. We cannot see that it has become the fashion to attack them indiscriminately, without regard to their good qualities or their mission. There is, however, a prevailing desire that corporations shall be prevented from wronging individuals or the general public. We have not heard "this continuous, persistent, zeal-without-knowledge cry that all co-operated forms of capital are inimical to the success and welfare of the American people."

We do not believe it has been heard by the directors of this speaker's company, among whom are Robert H. McCurdy, formerly general manager of the Mutual Life; Mr. McIntyre, formerly vice-president of the Equitable Life; and several other gentlemen who were recently, or are now, directors of these life insurance companies and officers or directors of their subsidiary Trust companies and similar institutions. Some of them may be dissatisfied with recent legislation, but they cannot prove that the American people are making an indiscriminate and persistent assaults upon all corporations.

The Armstrong investigation was not such an assault, nor did it grow out of

popular hatred of all co-operated forms of capital. It was not because the Pennsylvania and other railroad companies were corporations that the people, by a resolution of Congress, directed the Commission to investigate their relation to producers of coal and oil.

The other address was one delivered before the students of Ripon College by William H. Timlin, recently elected a Justice of the Supreme Court of Wisconsin. He saw grave problems, but would not resort to socialism for a solution of them:

"Some well-thinking persons think we could get rid of the whole scandal by keeping quiet about it. There are persons who make much of the term 'muck-rakers,' and who unthinkingly are the instruments of the proprietor of the muck heap, who objects to its being raked."

We should give up, he said, the "notion that an individual or corporation has the right to get, hold, or own as much money or property as he or it can acquire." The Constitution of the United States should fix "the maximum amount which can be held by any one person, natural or artificial." Millionaires should not be eligible to seats in the Senate. "Our courts should be trained to learn that the imprisonment of a millionaire is not sacrilege."

"We must free ourselves of remnants of corporation worship which still cling to us by subjecting these creatures of law to stricter and closer regulation. It should be cause for forfeiture of charter and imprisonment of directors if any false entries are made in their books of account, or any corporate funds are paid out for any purpose without truly specifying both the purpose and the amount."

The significance of all this lies in the fact that such opinions concerning a limit for personal or corporate holdings should be expressed by a Justice of the Wisconsin Supreme Court. There is nothing in the published report of Judge Timlin's address to show that he would prevent the formation of corporations or is hostile to them. But he would subject them to regulation and restraint in the interest of the general public, and would have their officers punished when guilty.

Judge Timlin's radicalism is undoubtedly due to recent disclosures of corporate greed and wrongdoing. If corporation officers are shocked or alarmed when judges express such views, they should understand that the corporations

themselves, or some of the greatest of them, are responsible for such public opinion as this Wisconsin judge represents. If powerful corporations, be they railroad companies, life insurance companies, or manufacturing concerns, continue to violate the laws, and to offend the moral sense of the public by unjust discrimination, there will be more Judge Timlins on the bench and the number of Socialists in the United States will rapidly increase.

### That Immigration Bill

In the construction of an immigration bill the last concern which should affect a patriotic legislator is the political effect it would have on the fortunes of a party. We have had enough of such considerations in the Chinese exclusion law. The first thought should be of the benefit to this country, and next, the advantage to the immigrant. It is perfectly proper to exclude certain classes—criminal, or those not likely to be supported. But in the latter case there ought to be discrimination. For example, when an immigrant who has done well here sends over for his family, one child should not be sent back because it has trachoma of the eyes, or because it is weak-minded. That is cruelty. Again, the charge of five dollars a head is an outrage. It is a heavy burden on a family of four or five children, and it is a grasping provision far exceeding the cost to the Government of the supervision of immigration. Every decent immigrant brings in himself a financial acquisition to the country, and to squeeze money out of him when he comes in is simply mean. Further, we do not like the provision that immigrants should be able to read some language. It is desirable that they should, but they are valuable workers on our roads or in our mines even if they cannot read, and their children will be educated in our schools. The bill is absurd in forbidding children under sixteen to come without their parents. There are many cases where a man sends for his family, but his wife has meanwhile died, and a sister brings the children. Why should she not? The provision of the bill requiring the immigrant to bring a certain amount of

money should be made more elastic. Thus, if he has a ticket to Minnesota, that ought to count as so much money. Such points as these are brought out in a letter from Jane Addams to Speaker Cannon.

### Canon Henson on Unity

The English clergy were asked, on Whitsunday, to preach on Christian unity. Most of them took the general position of the sermon by the Archbishop of York, that if they could not join in corporate unity with their "dear Nonconformist friends," they might at least "endeavor to preserve the spirit of unity in the bond of peace." But Canon Henson, who has a frank way of expressing himself, took the extraordinary text: "Thou hypocrite, first cast out the beam out of thine own eye," etc., and made it the occasion to say that schism was the fault of the Anglican Church. We quote him:

"As long as Anglicans believe in the exclusive validity of an Episcopalian ministry they will perforce traverse the futile and familiar cycle, which begins with sentiment and ends with disappointment. Nearly twenty years have passed since the Lambeth Conference sterilized in advance its efforts for reunion by placing in the foreground of all negotiation the exclusive claim of the historic episcopate, actually raising the form of Church organization to an equality with the acceptance of the Scriptures and the sacraments. It is worse than useless to invite men to a discussion when you have postulated your own conclusions in advance. The parade of elaborate inquiry is hypocritical if you first place the very subject of inquiry on the level of unalterable truth. Until we are prepared to accept teaching on this matter of the validity of the ecclesiastical claims we advance, I am constrained to think that our prayers and preachings on the subject of reunion, so far from leading to any good result, are likely to strengthen us in our own prejudices and render the breach between us and our separated brethren even wider."

That is extraordinary and unusual doctrine as coming from an Anglican, but it is true. It is liberty of spirit, and not rigidity, that is the condition of union. Phillips Brooks said:

"The real unity of Christendom is not to be found at last in identity of organization, nor in identity of dogma. Both of these have been dreamed of and have failed. But in the unity of spiritual consecration to a common Lord all souls shall be one with each other in virtue of that simple fact. There is the only unity that is thoroly worthy either of God or man."

Phonetic Orthography The Simplified Spelling Board is not bothering itself with phonetic orthography, simply because that is so far in the distance, and it seeks only immediate hopeful ameliorations of our wretched orthography. Very few people are radical reformers; they are satisfied to progress a little way along the line of least resistance. Accordingly, the Board, whatever may be the esoteric ideas of its members, and their ultimate hope, are simply trying to persuade people to adopt those simpler spellings which more venturesome people have initiated. Thus, Webster three-quarters of a century ago dropped the *u* out of *labour*, and the Board approves, which is not much. A few people spell *altho*, and the Board plucks up a little more courage. Whether the members know it or not—and we think they do—the ultimate aim should be pure phonetics, which means a reformed alphabet and scientific spelling. It is bound to come, and we are glad that there are other societies which are devoted to this purpose. No better work along this line can be done than that of the men who are now trying to develop the best system, with the simplest sort of alphabet. Then a child, or a foreigner, can learn to read in a few weeks.

It is rather interesting to read the long and numerous letters of English bishops and ecclesiastics on the evil results of the neglect of religious education on public morals. Here is the Right Rev. Bishop Wilkinson, who has the charge of the Anglican churches in north and central Europe, who devotes two columns of the *London Times* to proving that it will be the ruin of British character if children are not taught religion in the schools supported by the State. So he quotes various European authorities, including the *Revue des Deux Mondes*, the editor of which he absurdly imagines to be a free thinker and not a good Catholic, to support his position, and discovers that the reason for the development of German learning and industry is because the German schools teach religion, and the German Emperor is a religious man. Why did he not look across the ocean? The

United States is the most religious nation in the world, and here we look to the Church to teach religion, and refuse to allow the State to meddle with the matter. We prefer secular schools.

It was without our intention that Prof. Goldwin Smith's article in this week's issue on Jewish persecutions is so timely—or shall we say untimely. It is not to our pleasure to have the Jews spoken of as "a parasitic race." To this extent the author is right, in his view that a people who refuse to intermarry cannot expect affectionate social relations. In this country, at least, the Jews are more manufacturers and shopkeepers than money-lenders, and so not parasitic. But, as Goldwin Smith says, there is no justification of the horrible barbarities that have during these last few days occurred in Russia. They disgrace humanity, and would justify indignant protest by our Government, but that we are a nation of murderers and lynchers who go unpunished.

We would like to tell Dr. Phelan, of St. Louis, that the decision by Pope Pius X to settle the claims of the Philippine Friars' money matters to the advantage of the Philippines is by no means the first time that THE INDEPENDENT finds itself on the side of the Pope. In all Leo's relations with the French Republic we were stoutly on his side. In the matter of these Friars THE INDEPENDENT was the first to suggest publicly that the President send a commission directly to the Pope, as it was his business; and it was Mr. Taft's mission there, on his way to Manila, which settled the sale of the lands to our Government. If we had not wished well to the Catholic Church, as well as to the Filipinos, we should not have done it.

Slowly the drama proceeds. The Duma becomes more radical, and the Russian Cabinet more repressive. There will be a terrible collision soon, and the Czar does well to keep his yacht ready to embark with his family.

## Suit to Recover Mutual Reserve Life Premiums

A CASE of more than ordinary importance to policy-holders in the Mutual Reserve Life Insurance Company of this city, who took out policies in that company in 1890 and for several years thereafter, comes up for trial at the term of the Equity Court which opened this week. The plaintiff in the test case is John Moore, the managing editor of the *Elmira Telegram*. A policy for \$10,000 in the defendant company was taken out by Mr. Moore early in 1892. He has paid premiums in the sum of nearly \$2,500. The Moore action is brought to rescind and sever the contractual relation and to compel the insuring company to account to him for the premiums paid with interest from the dates of the respective payments.

The complaint charges fraud and deceit, and sets forth alleged false representations made both to the plaintiff and to the public which were revealed thru the agency of the Armstrong Insurance Investigating Committee. The Mutual Reserve Life Insurance Company, in its answer, interposes a general denial of the allegations.

## The San Francisco Situation

AT a meeting of the fire insurance companies, held at San Francisco on June 12th, it was decided by a vote of 61 to 32 to stand by the resolutions adopted at the meeting of companies in this city on the last day of May, and to deduct not less than 25 per cent. flat from each policy or from claim if less than the face of the policy. This 25 per cent. deduction applies to cases in which the New York resolutions recommended "a reasonable compromise," as follows:

"Third—a. Where policies covered buildings (and/or their contents) which were probably but not certainly so damaged by earthquake as to be brought within the provisions of the fallen building clause; or

"b. Where policies covered buildings (and/or their contents) which had suffered from shock or earthquake, but not to such an extent as to

bring them within the provisions of the fallen building clause; or

"c. Where policies covered buildings (and/or their contents) which had been damaged or destroyed by the authorities, civil and/or military, before fire had reached them; or

"d. Where policies covered property whose owners by reason of the destruction of their books and records, are unable to supply the proofs of value required by the conditions of their insurance policies. In all such cases claims should be settled by a reasonable compromise."

The companies opposed to the scaling of claims, and which, it is understood, will pay claims regardless of the 25 per cent. cut, are:

The Ætna of Hartford, California of San Francisco, Mercantile of Boston, American Central of St. Louis, St. Paul Fire and Marine, Continental of New York, Atlas of London, Kings County, Springfield of Massachusetts, New Zealand, North British and Mercantile, Liverpool and London and Globe, Sun of London, Northern of London, Phoenix of London, Pelican of New York, London Assurance Corporation, New York Underwriters, Orient of Hartford, State of Liverpool, Hartford Fire, Citizens of St. Louis, Home of New York, Connecticut Fire, New Hampshire, Queen of New York, Royal of Liverpool, Teutonia, London and Lancashire, English-American Underwriters and the Individual Underwriters.

It is the announced intention of the California Insurance Commissioner to revoke the licenses of all companies failing to pay loss claims in full.

It appears that life insurance companies generally, as well as those recently under investigation, are conceded to be in a sound financial condition and that the solvency of these companies so far as any evidence has been presented does not seem to have been impaired. Under these circumstances, in our opinion, it seems lamentable for policyholders overcome by unreasonable panic to have sacrificed their policies, by surrender, as some were led into doing.

CABLE dispatches announce that, according to a decree published in the *Official Journal*, relative to the regulation of life insurance companies in France, premiums paid to foreign companies within the next five years must be invested in approved French securities.

# Financial

## The Growing Wheat

THE Government's wheat report for June indicates a crop of 713,000,000 bushels, which has been exceeded only once—in 1901, when the crop harvested was 748,000,000. There are more acres in wheat this year than in 1905, but the increase is slight. Even with a considerable decline of condition, the crop of winter wheat now promises to be 414,500,000 bushels, against 428,000,000 harvested last year. Spring wheat is in good order, and promises a yield of 298,500,000 bushels. Last year's was 294,500,000.

## Trade With China and Japan

TEN years ago our exports to China and Japan were less than \$14,000,000; in 1905 they exceeded \$120,000,000. No one who examines the official record of our trade with those countries can fail to be impressed by the remarkable increase of our sales to them. Here are the figures for China (with Hongkong included) in the calendar years 1895 and 1905:

|      | Exports to<br>China. | Imports from<br>China. |
|------|----------------------|------------------------|
| 1895 | \$8,166,778          | \$23,236,780           |
| 1905 | \$4,055,620          | \$9,798,874            |

As all of China's imports in 1905 were \$326,000,000, our share of them was about 20 per cent.; fifteen years ago it was only 6 per cent.; ten years ago it was only 8 per cent.; even in 1904 it did not exceed 13 per cent. But in 1905 China bought \$33,500,000 worth of American cotton cloth, against only \$14,000,000 worth in the preceding year. It is in such cloth and in copper (\$11,747,000 in 1905) that the increase is most plainly seen. While our percentage of China's purchases has been rising, Great Britain's has been declining. This trade growth is quite one-sided, for there has been but little increase in our purchases of China's raw silk, tea, carpet wool, goat skins and opium.

Our exports to Japan have grown not less rapidly, rising from a little more than \$5,000,000 in 1895 to \$21,000,000 in 1903, \$31,500,000 in 1904, and \$55,750,000 in 1905. Here there was a greater degree of reciprocity, for in these ten years Japan's sales to us increased by \$23,000,000. Japan's purchase of \$17,000,000 worth of our raw cotton in 1905,

compared with less than \$1,000,000 worth in 1895, shows the growth of her cotton mill industry. On the other hand, we bought from her last year \$29,000,000 worth of raw silk. Tea (\$7,000,000), silk goods (\$6,000,000) and matting (\$2,000,000) were other large items going to make the total of \$52,000,000. Our exports to both countries should continue to increase. Unfortunately, the failure of Congress at its present session to modify the exclusion laws may cause a renewal of the Chinese boycott of American goods.

....American capital, represented by Speyer & Co. and the National City Bank interests, has undertaken the construction of several new lines of railroad for the Bolivian Government. These roads will connect Pacific ports with the rich rubber country of Eastern Bolivia and the Brazilian dependency of Acre.

....Fisk & Robinson, of this city, have been awarded the entire issue of \$1,000,000 3 per cent. gold canal bonds by the New York State Comptroller. These bonds are exempt from taxation, run for fifty years, and are issued either in registered or coupon form. They were purchased at 101.13 and interest.

....The Western Union Telegraph Company's report for the quarter ending with the present month shows that, after payment of interest and the usual dividend, the surplus will be increased on the 30th to about \$16,860,869. On March 31st it was \$16,659,191.

## Dividends announced:

Ach., Ten. & S. F. Rwy (Preferred), \$2.50 per share, payable August 1st.  
Mergenthaler Linotype Co. (Quarterly), 2½%, payable June 30th.  
United Fruit Co. (Quarterly), 1½%, payable July 15th.  
Franklin Trust Co., Brooklyn (Quarterly), 3½%, payable June 30th.  
Minn. & St. Louis R. R. Co. (Preferred, semi-annual), 2½%, payable July 15th.  
Southern Pac. Co. (Preferred), 3½%, payable July 2d.  
N. Y. Cent. & Hudson R. R. R., 1½%, payable July 15th.  
Philadelphia Co., Pittsburg, Pa. (Common), 1½%, payable August 1st.  
Franklin Society, 5%, payable July.  
Nat'l Sugar Ref. Co. (Preferred), 1½%, payable July 2d.

## NATIONAL AND STATE BANKS

NEW YORK, THURSDAY, JUNE 28, 1906

No. 3004

## Survey of the World

### The Oil Trust to Be Prosecuted

For some time the Government has been getting evidence relating to the violation of laws by the Standard Oil Company and the railroads with which that company has had dealings. A part of this evidence was laid before Congress in the Garfield report. In a message accompanying that report the President said that the Department of Justice would "take up the question of prosecutions in at least certain of the cases." The evidence was considered at a special meeting of the Cabinet on the evening of the 20th, and again at the regular meeting on the 22d, being subjected to the examination of Messrs. Root, Taft, Bonaparte and Moody, all prominent in the profession of law. On the afternoon of the 22d Attorney-General Moody gave to the public a statement, beginning as follows:

"After full consideration of all the information now available, including the report of the Commissioner of Corporations and the evidence taken by the Interstate Commerce Commission, I have reached the conclusion that criminal proceedings against the Standard Oil Company should be begun in certain cases where there appears to have been a violation of the laws regulating interstate commerce and prohibiting rebates and other unlawful discriminations. Accordingly, such proceedings will be begun at once in the appropriate judicial districts. These cases are regarded and will be treated as of importance, as it seems clear that in so far as the Standard Oil Company has obtained monopolistic control of interstate trade that control has been in large degree made possible by discriminations in transportation rates or facilities, the discriminations being in some cases in violation of law, and in other cases, tho injurious to the public welfare, not in violation of law, and therefore subject only to such correction as may be afforded by the railway rate legislation now pending in Congress."

The investigation of the Standard's affairs would be continued, he added, with the view of ascertaining whether there had been any violation of the Anti-Trust law or any other Federal statute. He had employed as special counsel Frank B. Kellogg, of St. Paul (who recently represented the Government in its suit against the Paper Trust), and Charles B. Morrison, now District Attorney at Chicago, who would soon resign that office. The course of action thus indicated had been approved by the President and all the members of the Cabinet.—It is understood that grand juries will soon be at work in several States, and that indictments will be sought under the Interstate Commerce law, the Anti-Trust law, the Elkins act, and that paragraph of the Revised Statutes which permits imprisonment for conspiracy to commit a crime. This is the statute under which the two rebate agents were sent to prison last week at Kansas City. In a letter to District Attorneys, a few months ago, Mr. Moody urged them to obtain indictments under this law wherever the evidence warranted such a use of it, in order that prison sentences might be imposed. He now hopes by enforcing this law to place prominent guilty persons in jail, but dispatches from Washington say he does not expect to convict the highest officers of the Standard Oil Company. John D. Rockefeller, president of the company, who is now in France, is reported by cable to be saying that he has had no connection with the company for twelve years.—The proceedings before a grand jury in New York, relating to the corporation commonly called the Tobacco Trust, have resulted in the in-

dictment of the McAndrews & Forbes Company of New Jersey, and the John S. Young Company, of Baltimore, with their presidents, Karl Yungbluth and Howard E. Young, for violation of the Anti-Trust law. It is alleged that the Trust controls these companies and by means of them monopolizes certain materials used in the industry.—At Toledo five ice dealers (Messrs. Miller, Beard, Lemmon, Breining and Waters), prominent in the business of the city, have been fined \$5,000 each and sent to the workhouse for one year, for conspiring to restrain trade in violation of the Anti-Trust law of Ohio. Miller was convicted; the remaining four pleaded guilty. They had combined and, saying that there was a small supply of ice, had increased the price by from 50 to 100 per cent. By restitution they can procure a mitigation of their punishment.—The Attorney General of Connecticut asks the courts to revoke the charters of three ice companies which, it is alleged, have combined to exact high prices in Hartford.—The International Harvester Company, sometimes called the Harvester Trust, has consented to plead guilty to a violation of the Anti-Trust law of Arkansas and to pay a fine of \$20,000, with costs. In its contracts with dealers it required them to refrain from selling the similar machines of other manufacturers.

#### Rebaters Sent to Prison

Two men found guilty in the District Court at Kansas City are the first rebaters to suffer by imprisonment. They are George L. Thomas, a freight broker, and L. B. Taggart, his chief clerk, both of New York. They procured rebates on goods shipped from New York to dry goods merchants in Kansas City and St. Louis, these rebates amounting in four years to \$82,000. Judge McPherson, on the 22d, sentenced Thomas to pay a fine of \$6,000 and to be imprisoned in the penitentiary for four months. Taggart's term is three months, with a fine of \$4,000. They were tried under an indictment charging them with conspiracy to violate the law concerning rebates. For receiving or soliciting or giving rebates they could not have been impris-

oned, but section 5440 of the Revised Statutes permits a prison sentence for conspiracy to commit a crime, even if the law does not provide such a penalty for the crime itself. In these cases Attorney-General Moody directed the prosecutor to ask for punishment by imprisonment. It was suggested by Judge McPherson that the Government should now prosecute the merchants by whom the rebates were received.—On the same day Judge McPherson sentenced the Armour, Swift, Cudahy and Morris packing companies, recently found guilty of receiving unlawful concessions on shipments to New York (for export), and the Burlington road, which granted the concessions, these amounting to 34 per cent. of the published rate. Each of these defendants was fined \$15,000. Counsel for Thomas and Taggart said to the court that it was unjust to send them to prison while the packers were punished only by a fine.

#### Railways and the Coal Trade

Charles E. Hughes and Alexander Simpson, Jr., recently employed by the Government to inquire as to alleged violations of law by railroads engaged in the coal trade, have completed a report relating to some of the roads and have submitted it to Attorney-General Moody. It is said that the work of prosecution will be begun in Philadelphia, and there is a persistent rumor that the Government intends to proceed against President Cassatt, of the Pennsylvania, Vice-President Thayer, of the same company, and President Newman, of the New York Central, alleging the payment of rebates or the granting of unlawful concessions (especially to the Standard Oil Company), discrimination in other forms, and a violation of the Anti-Trust law in the matter of the virtual combination of the Eastern roads engaged in the bituminous coal trade.—No railroad president has appeared before the Commission in response to the invitation published last week. E. J. Berwind testified at length on the 19th in behalf of the Berwind-White Coal Company, asserting that the Pennsylvania had not discriminated in favor of that company, the largest shipper of

bituminous coal over the Pennsylvania's lines. No one connected with the Pennsylvania, he said, had any interest in his company, except General Freight Superintendent Shepherd, to whom 50 shares had been given because he had helped the company to acquire coal lands. It appeared from other testimony that the Western Maryland road owns the Davis Coal and Coke Company and operates 16 mines, while 40 on its line are operated by independents; also that the Buffalo and Susquehanna controls every coal mine on its lines, except one that is owned by the Erie. Vice-President Thayer, of the Pennsylvania, said that President Cassatt, before going to Europe, gave orders that the use of private coal cars be discontinued. There are 15,000 of these cars on the road. Mr. Thayer and Vice-President Pugh were responsible for suspending the order, because the change could not be quickly made. In the interest of fair play, however, the private cars must go. Mr. Thayer said that hereafter, in his judgment, neither railroad officers nor railroad companies ought to own coal mine stocks. He thought the time had come when transportation companies should confine themselves solely to the transportation business. The Baltimore and Ohio company, according to notice given by its attorney, hereafter will make an open and public distribution of cars among coal shippers. The Commission's inquiry will be continued at New Orleans.—Senator La Follette has introduced a resolution authorizing the President to withhold from entry or sale all public lands containing mineral deposits until Congress shall determine how they shall be used. He has also induced the Senate to adopt a resolution providing that the scope of the Commission's inquiry shall include the storage and transportation of grain. Investigation, he asserts, will disclose conditions as bad as those already found on the coal railroad lines.

•

#### It Is to Be a Lock Canal

Because the Senate unexpectedly voted for a canal with locks, last week, the question of the type of waterway to be made on the Isthmus has been settled.

By a vote of 110 to 36 the House had expressed its preference for a lock canal, and directed that no part of the proposed appropriation of \$25,000,000 for work in the Zone should be used in making a canal at the sea level. But the Senate committee had reported a bill for a sea-level canal, and there were indications that a majority of the Senate would support it. The views of some Senators, however, are said to have been changed by the speeches of Mr. Burton, in the House, and of Mr. Knox and Mr. Dryden in the Senate. Others who preferred a canal at the sea level perceived that a sharp disagreement of the House and the Senate would delay the construction of a canal of any kind. Some Republicans who thought that a sea-level cut ought to be made were unwilling that their party, controlling Congress by large majorities, should enter the approaching Congressional campaign with a record of disagreement and delay. And so it came about that when the Kirtledge bill for a sea-level canal was taken up, Mr. Hopkins offered an amendment providing for a canal with locks, and a motion to lay this amendment on the table was lost by a vote of 31 to 36, 10 Republicans and 21 Democrats preferring the sea level, while 35 Republicans and 1 Democrat (Mr. Patterson) voted for locks. The amendment, or substitute, which was then agreed to and will be accepted by the House, provides "that a lock canal be constructed of the general type proposed by the minority of the Board of Consulting Engineers." The members of the Commission, with Engineer Stevens, will sail for the Isthmus this week.—President Roosevelt intends to visit the Isthmus in November, going on a warship with Secretary Taft, and remaining in the Zone for about a week, in order that personal inspection may give him knowledge of local conditions.—Owing to the approaching departure of the Colombian Minister, Senor Mendoza, from this country, on leave of absence, a report has been published that he has been recalled to show Colombia's resentment of our Government's failure to honor her claim for payment on account of her loss of Panama. Senor Mendoza says, in a letter to the press, that his Government

feels no resentment; that there is no reason why Columbia should ever again be without representation at Washington, and that even if our Government should refuse to make an immediate settlement of the claim, this would prevent a withdrawal of the Minister, because it would be his duty to remain and press for ultimate payment or for reference of the claim to a tribunal of arbitration.

#### The Railroad Rate Bill

In the House, last week, the conference report upon the Railroad Rate bill was taken up and accepted by a vote of 216 to 4. Mr. Tillman and Mr. Richardson, the Democratic conferees, refused to sign the report, owing to the action of their associates with respect to pipe lines. The bill, as passed by the Senate, made the owners of pipe lines common carriers, but they were forbidden (by the clause designed to prevent railroad companies from owning coal mines) to carry their own products. Such a prohibition would very seriously affect pipe line traffic. The Standard Oil Company's pipes could not carry the company's oil or any oil purchased by the company from owners of wells. A majority of the conferees decided that the clause relating to the transportation of commodities should apply to "railroads" only, and not to all "common carriers." This change permits the owners of pipe lines (which are still made common carriers) to carry oil which they produce or buy. Hundreds of telegrams from independent producers of oil were received by Senators and Representatives, urging them to have the pipe line clause stricken out. These, it was shown, had been suggested by the Standard Oil Company's purchasing agent, Joseph Seep, in a letter to the company's buyers, saying: "It is from the important and well-known independent producing interests that you are to have these telegrams sent." The words which make sleeping-car companies common carriers and place them under the supervision of the Commission were restored. There was much opposition in the House to the radical changes made by the conferees in the clause about passes, but a separate vote upon it could not be obtained.

As the clause now stands it merely forbids common carriers to issue passes "to any officer or person in the service of the United States other than those in the postal service; to any officer or person in the service of any State, Territory or the District of Columbia, or to any officer in the service of any county, township or municipality."

#### Various Topics

Mr. Bryan attended the coronation of King Haakon at Trondhjem. While in that city, on the 21st, he was interviewed, and the following report of his remarks was cabled to this country:

"My position is that a private monopoly is indefensible and intolerable. That was in the Democratic platform in 1900, and the plank was incorporated in the platform of 1904, and it is the only tenable position. There is some talk of controlling the trusts. You might as well talk of controlling burglary. We do not say that men shall only steal a little bit, or in some particular way, but that they shall not steal at all; and so of private monopolies. It is not sufficient to control them or to regulate them. They must be absolutely and totally destroyed. Corporations should be controlled and regulated, but private monopolies must be exterminated, root and branch. Now, you may call that a radical doctrine, and yet it is more conservative to apply this remedy now than to wait until predatory wealth has by its lawlessness brought odium on legitimate accumulations. What used to be called radical is now called conservative, because the people have been investigating. The doctrine has not changed, but public sentiment has been making progress."

According to dispatches sent to Western papers from Washington, the President predicts that Mr. Bryan will be nominated by the Democrats in 1908, and expresses the opinion that the strongest of the candidates on the Republican side is Secretary Taft.—After an interesting debate, the Pure Food bill (which came over from the Senate in February) was passed in the House on the 23d by a vote of 240 to 17. The negative votes were cast by Democrats, whose opposition in most cases was due to questions of State rights. Some important changes were made by the House, and the bill is in the hands of a conference committee.—After a sharp discussion in executive session, the nomination of Benjamin F. Barnes, assistant secretary to the President, to be postmaster at Washington, was confirmed by a vote of 35 to 16,

Messrs. Gallinger and Heyburn voting with the Democrats in the negative. The objections raised by Mr. Tillman and others related to the forcible expulsion of Mrs. Minor Morris from the White House.

#### English Political Questions

The debate in the House of Commons over the Education bill is so strenuous that the Government is obliged to resort to closure, and has placed a definite limit on the time to be devoted to the discussion of each clause. By this means it is expected to get the bill thru all its stages in the House of Commons by July 20th. On August 10th Parliament will adjourn for a couple of months, but if the House of Lords acts with reasonable promptness there will be time to consider the Lords' amendments before the end of the year. The opposition made a strong attack upon Clause II of the bill on the ground that it was left optional with the local authorities whether they shall take over the denominational schools or not. In case the local authorities could not make a good bargain the school might be left without support. The Government is also sharply criticised for not carrying out the promises made before election to abolish Chinese contract labor in the South African mines. There are now, six months since the Liberals came into power, 50,951 Chinese in South Africa, more than ever before, and, altho a proclamation was issued and posted in the mines announcing that the Government would take back to China any coolies who were dissatisfied, only a very few took advantage of the offer, which rather discredits the electioneering claim of the Liberals that the Chinese were virtually slaves. The bill introduced by Mr. James Bryce, Secretary for Ireland, for the relief of Irish laborers by providing cheap loans for the purchase of land and the building of cottages, met with a favorable reception in the House. The amount to be used for building cottages is estimated at \$22,500,000. Mr. Redmond, in welcoming this aid for Ireland, said that the condition of the Irish laborers had long been a reproach to civilization and humanity. The conditions

were fatal to health and cleanliness, but in spite of them the Irish laborers had preserved the highest possible standard of living and morality.—The "suffragettes," as the belligerent group of agitators for woman suffrage are called, continue their policy of making public disturbances and getting into prison for it. Miss Billington and some of her followers attempted to break up a political meeting at which Mr. Herbert Asquith, Chancellor of the Exchequer, was speaking, by yelling for votes and waving banners. They were thrown out by the police in spite of their struggles, altho Miss Billington used a horsewhip vigorously. A mob collected outside and attempted to attack Mr. Asquith as he came out. A few days later a procession of sixty suffragettes made a demonstration in front of Mr. Asquith's house and the leaders were arrested. Miss Billington was charged with resisting an officer of the law, as she had slapped the constable in the face and kicked him on the leg twice. She refused to recognize the authority of the court or to pay the fine of \$50 imposed upon her, so she was sent to prison for two months.

**The Coronation of the King of Norway** King Haakon VII. and Queen Maud were crowned on June 22d at Trondhjem, the ancient capital of Norway. It was the first time in over 600 years that a purely Norwegian king has been crowned there, the last being King Haakon V., in 1299. Trondhjem, a fishing town of wooden houses and about 35,000 inhabitants, was gaily decorated in honor of the occasion, and as the gunboat "Heimdal," bearing the royal family, entered the fjord at 6 o'clock of the morning of the 19th, it was greeted with an artillery salute, supplemented by the shouts of the crowds on the shore. The town was filled with distinguished guests from all lands, many of whom had recently represented their respective countries at a similar ceremonial—the marriage of the King of Spain. The Crown Prince Christian and the Crown Princess of Denmark, Prince Harold of Denmark and Prince Henry of Prussia, the Prince and Princess of Wales, Princess Victoria of England and

Grand Duke Michael of Russia, were the royal relatives present. Besides the special embassy from the Government of the United States, there were a large delegation of Norwegians from America, and several other Americans, including Mr. and Mrs. William J. Bryan, and Mrs. Marshall Field and Mrs. Eddy, of Chicago. Many of the historical customs of Viking coronations were omitted, altho King Oscar, of Sweden and Norway, when he was crowned here in 1873, followed the ancient usages.

were met by the Bishop of Trondhjem, and as the King and Queen took their places on the thrones on the right and left of the nave, the choir of 200 voices sang a Te Deum, accompanied by the organ and the orchestra of the National Theater. After a sermon by the Bishop of Christiania, from the text Joel ii:21, the royal mantle was taken from the altar and placed upon the King's shoulders by the Chief Justice, and he was anointed with oil by the Bishop of Trondhjem. Premier Michelsen then

King Haakon, Now Crowned King of Denmark, with Queen Maud and Prince Olaf.

Queen Maud has not the personal courage of her cousin, the Queen of Spain, and in consideration for her nervousness the royal pair were hardly seen by the public. Instead of walking slowly thru the town from the palace to the cathedral, a distance of only 250 yards, according to the ancient custom, the King and Queen were driven there rapidly in a state carriage surrounded by cavalry. The cathedral is a Gothic building dating from the twelfth century and the finest church in Scandinavia, altho now partly in ruins. At the entrance the royal party

placed the crown upon the King's head. The act was singularly appropriate, for it was Premier Michelsen who prevented Norway from becoming a republic when the separation took place, and for the purpose of securing the good will of King Edward gave his daughter a throne, as is explained on page 1538 of this issue. The other symbols of power were presented by the members of the Cabinet; the scepter by the Minister of Foreign Affairs, the orb by the Secretary of the Interior, and the sword by the Minister of War. The coronation of

the Queen and the singing of a cantata composed for the occasion completed the ceremony.

#### A Debate in the French Chamber

A discussion of great general interest to the outside world took place last week in the French Chamber of Deputies on the subject of socialism. M. Jaurès, the most brilliant socialistic orator in the world, outlined the principles and policy of the party in a speech of three days' duration, and he was answered by M. Clémenceau, Minister of the Interior, who is an advanced radical, but an individualist rather than a collectivist. M. Jaurès was attacking the policy of the Government when he was called upon from the floor to give his own. In reply he said that he would prepare, in the course of the next few months, a series of bills for the inauguration of the socialistic *régime*, but would now give, in a general way, his views as to how the social revolution was to be accomplished. He quoted the official statistics to show how unequal was the distribution of property under the present *régime*. The only way to stop the war of the classes, as indicated by strikes, was to permit labor to reabsorb the capital it has created. This is expropriation, but not necessarily spoliation. He favored a policy of gradual indemnification. Our ancestors in the time of the French Revolution did not indemnify the clergy and nobility whose property they nationalized, and it was uncertain whether in Russia it would be possible to carry out the proposed plan for buying the estates, but he hoped it would be possible to effect the transformation peaceably and without injury to any one. The present laws permitted expropriation for purposes of public utility. Mines, railroads and factories would be bought by the state at a fair valuation, but the former owners could spend the money only in buying commodities, and could not again get control of the means of production. The vast apparatus of social production would not be managed by a bureaucracy, like the present, but by the democratic state, assisted by the whole people. The various trades unions would create general administrative councils, which would co-ordinate their

efforts. M. Guesde, one of the leaders of the Socialist party, stated that the people of France would be ready for the great social revolution at the next general election; that is, in 1910.—M. Clémenceau, in a witty and incisive speech lasting two days, ridiculed the impracticability of the Socialistic program, but declared himself in favor of the nationalization of great undertakings, such as railroads and mines. M. Clémenceau's policy was evidently more in accord with the sentiment of the Chamber, for it was received with much applause, and ordered, by a vote of 410 to 87, to be posted on the bulletin boards of every town in France.

#### The Situation in Russia

The committee of three members sent by the Duma to investigate the massacre of the Jews in Bialystok reported upon their return that the massacre was promoted by the minor police and that the soldiers did most of the shooting. They were unable to get any incriminating evidence of complicity against the higher authorities, but they condemn them for not preventing the riots. The Governor of Bialystok and commandant of the troops, General Bader, who left the city on the eve of the massacre without giving a single order, was accused by the committee of criminal conduct and neglect of duty. The Government has, since the report was presented, removed him from the post. Minister of the Interior Stolypin appeared before the Duma to reply to the interpellations on the outrages against the Jews. He stated that the Police Department as a whole was exculpated, but he admitted the guilt of some of his subordinates. Most of the police had acted properly, and 288 had recently been killed and several hundred wounded in the discharge of their duties. The Government, he said, did not wish to rule by martial law, but in times of disorder weakness is more dangerous than vigorous measures, which are taken not for repression but for the protection of life and property. The Minister could scarcely be heard on account of the hisses and jeers of the Duma. Prince Urusoff, who was formerly Assistant Minister of the Interior, but is

now a member of the Duma, made his first speech in reply to Mr. Stolypin. He said that such massacres were always organized by secret forces "carrying on political vivisection on living humanity," and that officials were often employed in fomenting disorders. When he was in office inflammatory proclamations had been printed in their own department without the knowledge of the Minister of the Interior or himself, but by the order of a man whom he regarded as responsible for the recent outrages, and so long as such persons, with the education and political faith of a police spy, were in power, the massacres would continue to disgrace the honor of Russia. The allusion evidently was to General Trepoff, the reactionary Governor of St. Petersburg, whose influence with the Czar is now very great. The Duma again passed a vote of censure on the Ministry and demanded its resignation. Minister of the Interior Stolypin appeared later before the Duma to explain what measures had been taken in regard to the famine. He stated that the famine conditions, tho exaggerated, were so severe as to demand every effort on the part of the Government and the co-operation of the public. The Government had already appropriated \$37,000,000, but much more would be needed. He denied the accusations that the Government had prevented private aid, altho he admitted it had refused help from avowedly revolutionary societies.

#### Kongo Reforms

The Kongo Administration has refused to publish the evidence in regard to abuse of the natives brought before the Commission of Inquiry. The British Foreign Secretary made repeated and urgent requests for the publication of the evidence, but the Kongo Government took the position that no foreign Power had the right to interfere in behalf of the natives, not even the Powers which signed the Berlin Convention establishing the Kongo Free State. The recommendations of the Commission of Inquiry have been embodied in ordinances which, by their signature by King Leopold of Belgium, have become the law of

the land. The provisions of the laws relating to the chief abuses complained of—the seizure of land, the forced labor in the collection of wood and rubber, and the use of arms—are given below:

"The land belongs to the natives who inhabit, cultivate or exploit it in conformity with local customs and usages according to the decree of September 14th, 1886. The Governor-General or District Commissary shall, with a view of encouraging native industry, allot to each village a superficial area three times as large as that already occupied by such village."

"Every adult and able-bodied male is required to pay taxes, either individually or collectively. The Governor-General shall fix the amount payable according to local conditions. The total amount payable shall be not less than 6f. nor more than 24f. per annum. The tax is payable monthly, but latitude for payment is given in special cases. The native may pay either in kind or in labor. The District Commissioners fix the article which shall be accepted in payment and the equivalent in cash; also the kind of work which will be accepted as payment, the rate per hour, the method of gathering the product, etc., but in such a way that the number of hours of labor shall in no case exceed forty per month per head. Cattle and domestic animals are not accepted in payment unless by special permission, nor is the ordinary station labor. It is forbidden to arm 'capitas' or sentries with breech-loading or improved rifles in enforcing payments overdue. In case of refusal of payment in kind the native may be detained, with forced labor, until the amount has been worked off; such constraint may only be applied by the District Commissioner or other authorized official, and cannot exceed one month in duration. For repeated offenses the period may be extended to three months."

"'Military Operations' are offensive movements of the public force against native populations, and can be undertaken when the inhabitants of a given district are in a state of revolt or hostility as shown by acts of violence on persons or property, or refusal to obey the law. The number of permits for carrying arms for establishments directed by Europeans must not exceed twenty-five rifles of newest pattern. Requests for a license must explicitly state the object for which the rifle is destined. The use of breech-loading or improved rifles is forbidden to natives who are charged to carry on commercial operations with their fellow countrymen."

"Three State inspectors are charged to watch over the due execution of the laws concerning the natives, and to see that the relations between natives and public agents are legally observed. The Governor-General assigns the districts of inspection and dates of visit. The inspectors are to come into direct contact with the natives and hear all complaints; they will be intrusted with the necessary powers to carry out their mission."

# A Lock Canal

BY JOHN F. DRYDEN

UNITED STATES SENATOR FROM NEW JERSEY.

[Hon. John F. Dryden, member of the Senate Committee on Interoceanic Canals, after the long investigation upon the subject of plan of canal, which was recently reported by the committee, came to the front, heading a minority report in favor of a lock canal, which he vigorously supported thru the debate and caused to prevail. In the following article he gives some of the effective arguments which influenced his course.—EDITOR.]

SINCE the discovery of America there is nothing that has caused such universal interest and energy, such study, investigation and exploration, as a passage thru, northeast or middle, from ocean to ocean. It has been the demand of ages, but the supply has been slow in meeting it.

Hudson did his part, from the Hudson River to Hudson Bay, to find a short cut for Northern mariners to the Orient. Spanish navigators entered every inlet southward, searching for a passage from Cadiz to Cathay. When it was indisputably established that there was no middle passage, from trails to wagon roads and railroad substitutes have been established, but the determination in the mind of man has not rested.

Under Charles V., in 1536, explorations were ordered of the Chagres River, with the object of turning it into a ship canal. Under Philip II., twenty-five years later, Nicaragua was explored in a similar hope, and to the present hour the great minds in commerce and engineering have given their most ardent attention to the problem of an interoceanic waterway. Every conceivable plan has been considered, every promise explored, every mile of land and sea gone over for some practical solution. In all the ancient and modern history of commerce and the annals of adventurous navigators and explorers in engineering possibilities, there is no chapter that equals the story of the ceaseless effort to force a highway for commerce thru the barrier which Nature had established between the Atlantic and Pacific.

It is a grand thing for us, as Americans, that it was written in the Book of Fate that this longed-for facility—the most important to commerce and navigation—should be America's gift to the

world. But even this part is not new. Henry Clay, in 1828, in a letter of instruction to the delegates to the proposed congress at Panama, wrote:

"A canal for navigation between the Atlantic and Pacific Oceans will form a proper subject for consideration at the congress. . . . What is to redound to the advantage of all America should be effected by common means and united exertion," etc.

In 1835 a resolution passed Congress:

"That the President of the United States be respectfully requested to consider the expediency of opening negotiations with the governments of other nations . . . for the purpose of effectually protecting, by suitable treaty stipulations with them, such individuals or companies as may undertake to open communication between the Atlantic and Pacific Oceans, by the construction of a ship canal across the Isthmus which connects North and South America," etc.

From that day to this the subject of an Isthmian waterway in some form or other has come before almost every session of Congress and has been constantly before the world. Survey and exploration have been constantly going on there under various nations. The French made their futile effort, and hope which had almost made the heart sick with failures was revived when Congress passed the act under which this nation secured the property of the new canal company and made the construction of the Panama Canal not only possible, but sure. The world at once accepted the assurance as certainty because America was at the helm. When the first and only railway across the Isthmus was projected it was laid out by American engineers, built by American capitalists, and, as a distinguished British admiral well said, "was such as only United States men could have accomplished in defiance of all obstacles." I am confident that the same assurance was felt when this nation

assumed the responsibility of the canal, and that the verdict of posterity will likewise honor America for having finally brought to a successful termination, in the face of all obstacles and after the disastrous failure of others, the construction of a trans-isthmian waterway adapted to the needs of the commerce and navigation of the world.

It was no rash enthusiasm—it was no leap in the dark—which brought America to finally assuming this gigantic responsibility. Our great men had been considering the matter for half a century. We had patiently watched the efforts of the French to carry out the design of Ferdinand de Lesseps for a sea-level canal, with a depth of 29.5 feet and a bottom width of 72 feet—like a brook to a river when compared with the canal which we have undertaken to construct. We had noted their first utter failure, the admirable courage with which the old company was reorganized, the report of the new commission of able scientific men and eminent engineers that the sea-level plan be abandoned and a lock canal constructed, and the subsequent history of the De Lesseps struggle. The thought had long possessed us. The spirit had simply lain dormant. It only required the suggestions of the Spanish War, the demands of our new possessions, the voyage of the "Oregon" round Cape Horn, to lead to the public demand that, by one route or another, America should construct an interocean waterway within a reasonable time and at reasonable cost.

Then came the question of location, and we all remember the anxious hours while it was under consideration; the efforts and counter efforts, the conflicting reports, the investigating commissions and the grand struggle of earnest and honest men that no false step be taken at the start. The question lay between Nicaragua and Panama. When it came before the Senate it was gone over in committee with the utmost care, but the Senate Committee also disagreed. The majority reported to the Senate in favor of Nicaragua, but a minority report was offered, signed by Senators Hanna, Pritchard, Millard and Kittredge, saying: "We consider that the Panama route is the best route for an isthmian

canal to be constructed, owned, controlled and protected by the United States," and it is only to the courage and rare ability of the late Senator Hanna and his associates as minority members of that committee that the nation owes it that the Nicaragua route was abandoned, the minority report accepted by Congress, and a ship canal at Panama became an American enterprise for the benefit of the world.

Thus the second great preliminary step was taken, and we have now just taken the third and practically the last. We have taken it with serious forethought, for better or worse; and beyond it almost all responsibility will rest upon the proper performance of the duty now determined upon by Congress. The engineers, the War Department, the President, can only be held responsible for properly carrying out the final decree of the Congress as to the type of canal which shall be built across the Isthmus of Panama.

Shall it be a sea-level or a lock canal? It is a question of tremendous importance. Opinions differ as widely as it is possible for them to differ—as widely as they differed upon the location. Engineers of the highest standing at home and abroad have studied the question carefully and expressed themselves for one type and against the other, with no possible harmony or agreement.

The Senate Committee went over and over the question, as it had with the others, and again it disagreed and brought in conflicting reports to the Senate. An overwhelming amount of evidence and expert opinion was presented, but men of the very highest standing disagreed. It is an issue of transcendent import, involving the expenditure of enormous sums of money, and political and commercial consequences of the greatest magnitude, not only for the American people, but for the world. The testimony of witnesses called before the Senate Committee alone is printed in three large volumes of over three thousand pages, presenting the greatest conflict of engineering opinion of modern times. The evidence and opinions are as far apart and as irreconcilable as the final conclusions. It is little wonder, then, that the committee also disagreed and the question became one of practical judg-

ment for Members of Congress to decide. Concerning its conclusions there is this which should be always remembered—that beyond the evidence and opinions of experts, it is not a question of the ideally most desirable, but of the practically

tion in 1902. Then it was a question of route, now a question of plan; but many of the facts connected with the earlier decision are identical today, while the evidence for and against sea-level or lock canal is as voluminous, as complex and

John F. Dryden.

most expedient under the circumstances, which finally confronts the American people thru their representatives, and that in supporting either opinion one may refer to very able authority.

The consideration today is similar to the critical state of the canal considera-

as contradictory as between the Nicaragua and Panama routes. Upon no subject which has come before Congress has so much been written and spoken. In respect to either plan there are advantages and disadvantages, and in view of the conflict of expert opinions, it seems

to me that these advantages and disadvantages are really the vital question for consideration and the base upon which the judgment must rest.

An important factor is the changed conditions and requirements which now demand a canal of much larger dimensions than before. Even as late as 1901 the depth of the canal prism was only 35 feet, against 40 to 45 feet now. The bottom width has been increased to 200 feet. The length of locks has been changed from 740 to 900 feet, the width to 90 feet; for the Spooner Act, which is, so far, the authority upon which construction has continued, provides for a canal of such dimensions that the largest ship now building or likely to be built within a reasonable period of time can be accommodated. In this connection one of the arguments which appeared to prevail against a lock canal was the requirement of locks of dimensions far exceeding any that have ever yet been made; but upon this argument we should also abandon building the canal itself. It also strikes me that if inherent possibility of accident, of which much has been made, is a justifiable obstruction, then no great steamships, no great battle-ships, no great bridges or tunnels, no great works of any kind, should be undertaken. The "Soo," as a lock canal, has been in operation for fifty years. It has been enlarged till it accommodates a larger traffic than passes thru all other ship canals of the world combined, and is a fruitful study for those who doubt the safety or possibility of a great lock canal. The proposed deep waterway from Chicago to the sea, at an expenditure of three hundred million dollars, has several locks with a lift of 40 feet, the same as those proposed for the Panama Canal.

Undoubtedly there is an element of danger in the great dam. Danger is inherent in every dam that was ever built; but the quality of danger in the great dam at Gatun, for a lock canal, would be fully offset by quite equal danger in the great dam at Gamboa, which is indispensable to the sea-level project. In all questions of this kind I believe that the aggregate experience of mankind ought to have greater weight than the abstract theories of individuals, and I am confi-

dent that our engineers, who have successfully solved all of the greatest problems as yet presented, will solve with equal success whatever problems are presented at Panama. I do not question the ability of our American engineers to build a sea-level canal, but I am convinced, by the facts and evidence, that they cannot do it within the range of time and money assumed by the advocates of the sea-level project; and even if they could, I believe that the convincing arguments of expediency are with the lock system.

The question of time is of supreme importance. Ten years is valuable in a nation's life. It is of greater value to the world. Many a time the map of the world has changed in less than a decade, in ways that seemed impossible a few years before. The social, commercial and political development of South America and of the Asiatic nations at this critical stage, when one hardly knows what a day may bring forth, will be materially affected by an Isthmian waterway, and since we have assumed the task, it is our duty as a nation to complete it in the shortest reasonable period. Valuable years have passed, with the effect they might have had. Opportunities have been lost which might have been made of incalculable benefit to the world. Twenty years are gone since De Lesseps, in sublime confidence, anticipated the opening of the canal in 1888. Shall twenty years more be sacrificed that we may have something which is ideally most desirable, rather than the earlier benefit of that which is practical and most expedient? Had De Lesseps adopted the suggestion of the American engineers and abandoned his determination to build a sea-level canal, he would have lived to see its completion, and for fifteen years the world would have been profiting by an Isthmian waterway.

Another question presenting itself very strongly to my mind was the time of transit. It might be a little longer thru a lock canal, and this has been raised as an important objection to the plan. It is only a possibility that it might be, but be it so, the increased cost of the sea-level canal, at the lowest assumed estimate, will be more than a hundred million dollars in excess of the lock

canal, imposing an annual burden of over two million for interest alone, which must be met by increased fees and tolls, compared with which the loss of an hour or two in most cases would be a negligible quantity; besides which, the sea-level canal would provide no passage at all across the Isthmus for ten years more, at least, after the lock canal could be completed. If it is of sufficient importance to gain an hour or two in transit to sacrifice all the facilities for ten years, it might as well be argued that we should build a 300-foot canal, to be ready to offer still greater speed facilities to the commerce of the year 2,000. But to the practical navigator, leaving New York today for San Francisco, the loss of an hour or two in crossing the canal would be no argument with the loss of forty to fifty days which he must sustain in going round Cape Horn until the canal is completed.

So, summing up the conditions and demands as well as the expert testimony, the minority of the committee found the great weight of argument decidedly in favor of a lock over a sea-level canal, treating it as a business enterprise, to be governed by principles which would govern in private affairs, involving the risk of private capital. When we found American engineers of national repute almost unanimous in favor of a lock canal, it strengthened our convictions regardless of the findings of the foreign engineers, leading us to the emphatic and incontrovertible conclusion that the canal should be the one which can be constructed within a measurable distance of time and at a reasonable expenditure of money, as opposed to visionary and uncertain theories of an ideal canal, which might ultimately be constructed, chiefly at least for the benefit of future generations, and at an enormous waste of time and money and opportunity today. In a word, while the sea-level canal would cost a vast amount more money and require at least twice as long in construction, it would not accommodate any larger ships or larger traffic.

The inherent dangers, difficulties and weaknesses of the two appeared about equally divided, taking all viewpoints into consideration, and while, had cost and time been equal, a sea-level canal

might have been preferable, there was no question that the lock canal could fill all the requirements and be completed within a reasonable time and at a reasonable cost. A vast amount of testimony and argument was considered, touching points beyond possibility of recounting, but this was the general line of thought leading to the conclusions. The world at large, upon less voluminous testimony, has also arrived at one conclusion or the other, sometimes, perhaps, in misapprehension of the real conditions. There is a certain fascination about the prevailing idea of a sea-level canal which is captivating. To many it indicates one long, straight stretch of calm, motionless water, reaching from ocean to ocean. That would be an ideal canal and one most heartily to be approved. Even Congress has been asked to rely upon the experience gained in the Suez Canal, where the conditions are fundamentally different from what they could ever be made at Panama. In reality, the sea-level canal must have several sharp and undesirable curves. It must have great tide locks to keep the oceans back, and several dams; one, the great dam restraining the river, upon which the integrity of the canal must rest, fully as doubtful an engineering feat as anything connected with the lock canal; while in the lock canal the courses are straight, the changes being made at intersecting tangents, so that the canal can be marked with ranges, allowing it to be navigated at night. The projected lock canal also presents a waterway of navigable area three times that of the sea-level, with possibilities for enlargement not to be thought of in connection with the sea-level canal, tho this is rather at variance with the popular conception of the two.

The apprehensions of danger to the lock canal are largely imaginary; that is, they are not derived from experience. There are but two which might be of grave importance, if they were more applicable to one plan than the other—danger to the canal in case of war or from earthquake.

For the protection of the canal from wanton injury, I think that in any case our safest reliance will be upon the canal itself. It could never be for the interest of any nation of sufficient size to be at

war with us to destroy this great waterway, which will be a necessity to the commerce of each and all. No neutral nation engaged in trade would for an instant tolerate destruction or serious interference with the traffic of the canal. To destroy a single lock would be an act of war with every commercial nation of the earth. In this simple fact lies greater security than in all the forts which might be established to protect either canal. Against personal acts we must take our chances in either case. They are a remote contingency, and still more remote is the possibility of any serious injury being effected. No canal can be built that is free from vulnerable points. No fort or battleship can be so built. It would be folly to delay the completion of the canal for years and sink more than a hundred million dollars out of fear of such a remote contingency. Besides, as a matter of fact, as effective ruin could be wrought, to all practical service, upon a sea-level as a lock canal, if one were so minded. The history of the inception of the Suez Canal is full of these same threats. The English nation was effectively frightened out of any investment in the rash scheme. Eventually, however, England found it for her advantage to purchase the controlling interest.

The power of earthquakes to damage such a construction is an unknown quantity, but where it has been tested little serious damage has been done. More-

over, earthquakes are almost unknown in the canal belt. This was the most effective argument in the choice of Panama. In any serious consideration of facts for or against a lock canal, I am confident that the earthquake risk may be safely ignored.

In short, while there is no question whatever that a lock canal can be constructed and made a practical waterway equal to all probable demands, within a time and price that are reasonable, there is a very serious question of doubt whether a sea-level canal can be constructed and made a practical waterway, certainly within the limits of even the time and money estimated. The enterprise is imperative, and any needless waste of time or money is little short of indifference to the objects at stake.

It is a question upon which opinions will always differ and honest convictions may be widely at variance, but I am satisfied that the objections raised against a lock canal are an undue exaggeration of difficulties inherent to every great engineering project, and I have absolute confidence that our American engineers will surmount all difficulties, as they have often surmounted them before, and prove to the world the possibility of opening the long sought passage, in spite of all the obstacles which Nature has set in the way, if they are given the opportunity to carry out the plan which they have so generally indorsed.

WASHINGTON, D. C.

## The Czarina

BY EMMA HUNTINGTON NASON

A regal woman of imperial grace,  
In brodered raiment set with pearls  
    agem;  
The pride of birth engraven on her face:—  
That saddest face beneath a diadem!

Perfect of poise, she plays a queenly part,  
In beauty peerless as the marble dead;  
The warmth of motherhood within her  
    heart;  
Within her eyes the woe of tears un-  
    shed.

Beneath the splendor of a crown she stands,  
Where days are courtly and the pageant  
    long;  
She knows the royal touch of sovereign hands  
In love extended:—and the gates are strong!

And yet she sees gaunt forms in shadows  
    drest;  
They clutch her robes in their unholy strife;  
She clasps her baby boy unto her breast,  
With one mute prayer: "God save his  
    precious life!"  
AUGUSTA, ME.

# Did the Babylonian Temples Have Libraries?

BY PROF. MORRIS JASTROW, JR.

[Professor Jastrow, of the University of Pennsylvania, is one of the most accomplished Babylonian scholars in this country. He is now in Germany putting thru the press a German translation of his important "Religion of Babylonia and Assyria." The substance of this article was read at the late meeting of the American Oriental Society.—EDITOR.]

ON the basis of the results of excavations conducted up to the present on the sites of ancient Babylonian cities, there are no sound reasons for assuming that, with the single exception of the city of Babylon, the Babylonian temples ever had extensive literary archives. Four sites in Babylonia have now been pretty thoroly explored, and in three of these notable results, including the discovery of large numbers of tablets, have been attained. These three sites are Telloh, Abu Habba and Nippur. All three are of first-class historical and religious importance, Telloh being the ancient city of Lagash (or Shirpurla), which played an important rôle in early Babylonian history; Abu Habba is Sippar, certainly one of the most ancient cities of the Euphrates Valley, and famous as the chief seat of the worship of Shamash, the sun-god; while Nippur was at one time the center of a kingdom of considerable extent, and after it yielded its political prestige to Babylon, continued to be a religious center as the seat of the worship of Bel, once the head of the Babylonian pantheon. The fourth site in question, where excavations were undertaken over fifty years ago by the French, and again taken up recently by the German Oriental Society, is Babylon. Altho the topographical results here have been extremely valuable, the excavations have been a disappointment in not yielding richer returns in inscriptions and tablets.

What is the character of the tablets found within the temple precincts of Lagash, Sippar and Nippur? At Lagash a temple archive of some 30,000 tablets has been discovered, but the tablets deal, with scarcely any exceptions, with the business affairs and administration of the chief temple at Lagash. At Sippar about 60,000 tablets have been found within the precincts of the temple to the sun-god. The great majority of these are likewise of a business character, but divided into two classes, (1) such as deal with the business affairs of the temple, and (2) such as are concerned with the commercial transactions and legal business of private individuals. From this we may conclude—for which there is concurrent testimony—that the temples of Babylonia, at least in certain places and from a certain time on, served as the official depositories for legal and commercial records, corresponding somewhat to a modern "recorder of deeds" office.

In addition to this, there have been found at Sippar the remains of the temple school, in which the aspirants to the priesthood received their training in reading, writing and mathematics, and such other subjects as were needed by them to carry on the elaborate temple cult. Sign lists, grammatical paradigms, writing exercises, syllabaries, multiplication tables and astronomical calculations form the chief part of the tablets belonging to the temple school; but there are

also some distinctly literary texts, such as hymns, incantations, legends and myths, which are either practice tablets, prepared in or for the school, or represent in part the collection of texts used in connection with the cult. It is plausible to assume that the texts comprising the ritual of the temple were kept in the school or somewhere near the school; but even assuming that there were a couple of hundred texts of this character, this would not constitute a "Temple Library," by which an extensive literary archive is meant.

So far as can be judged by the unsatisfactory data at our disposal for determining the character of the finds made by Messrs. Peters and Haynes at Nippur, the large collection of tablets from the temple of Bel at that place is precisely of the same character as at Sippar. The great bulk of the Nippur tablets are no doubt of a business and administrative character, either connected with the temple or of a private character; and it is also evident that among the 17,000 tablets (or thereabouts) found by Haynes at Nippur in January and February, 1900, there were quite a number that must have formed part of the outfit of the temple school—sign-lists, writing and reading exercises, syllabaries, multiplication tables, etc.—precisely as at Sippar. That among the school outfit there are also some literary texts in the proper sense (hymns, incantations, etc.) may be regarded as extremely probable. As a matter of course, we must assume that either in the school or somewhere within the temple precinct at Nippur (as at Sippar), the religious texts used in connection with the cult were kept; but these certainly did not range into the thousands, and at all events there is not the slightest reason for assuming that there was a temple library at Nippur consisting of "23,000 literary texts." At Babylon the number of tablets found by systematic excavations has been small, but thru private diggings of thievish Arabs conducted at various times, many thousands of tablets have been brought out of the mounds at Babylon, and from the mounds on the opposite side of the river marking the site of Borsippa. Thru dealers these tablets have found their way to the mu-

seums of Europe and America. Here again the vast majority have turned out to be business documents, either bearing on the administration and commercial activities of the temple to Marduk at Babylon and the temple to Nebo at Borsippa. Evidence is also forthcoming for the existence of temple schools at both places, and we have numerous syllabaries, grammatical paradigms and religious texts that can be traced back to these schools.

In view, however, of the centralizing religious tendencies that set in after the days of Hammurabi (c. 2200 B. C.), who united the various Euphratean states into a single empire, and which led to the endeavor to assign to Marduk, the patron deity of the city of Babylon, the attributes of all the other great gods, like Bel of Nippur, Shamesh of Sippar, Ea of Eridu, myths that were originally associated with the one or the other of these gods, were transferred to Marduk. Instead of Bel of Nippur, Marduk became the slayer of the dragon Tiamat and the institutor of law and order in the world. Hymns and rituals that were prepared for the Bel, Shamash and Ea cults were changed and adapted to the worship of Marduk. There would thus be a motive on the part of the priests of Marduk to collect in the temple or in the temple school literary productions that originated in Nippur, Sippar, Eridu and elsewhere, whereas the motive would be lacking, *e. g.*, in Nippur, the priests of which would not be interested in the hymns, incantations, rituals and myths that belonged to Sippar, and *vice versa*. Literature for literature's sake did not exist in ancient Babylonia. All literature, as all religion, had a practical basis and a practical purpose.

With the single probable exception of Babylon, therefore, there is no reason to believe that the Babylonian temples had libraries, *i. e.*, extensive literary archives. The evidence is against the assumption, and the assumption itself is unwarranted. The exception in favor of the Marduk archive at Babylon is favored by the testimony to be derived from the only genuine library hitherto found in Mesopotamia, namely, the large literary collection made by King Ashurbanapal of Assyria in the seventh century B. C., in

his palace at Nineveh, which was discovered by Layard in 1849. Thru Layard and subsequent explorers, like Rassam, Smith, Rawlinson and Budge, almost 30,000 tablets and fragments of tablets have been brought to the British Museum. About two-fifths of this collection is of Babylonian origin, representing copies of Babylonian texts prepared from the originals by Ashurbanapal's scribes. Internal evidence shows that very many of these originals belonged to the Marduk archive at Babylon, which it is safe to assert constituted the chief source for the Babylonian literature preserved in the library of the ambitious Assyrian king. In the case of Ashurbanapal, there was

a motive for the collection of texts not produced in Assyria, only this motive was secular, and not religious as in the case of Babylon. The Assyrian monarch wished to secure for his capital, Nineveh, the pre-eminence once enjoyed by Babylon; and in order to emphasize and symbolize his control of Babylonia and her cults, he gathered in his palace—not in a temple—the outfits of the temple schools in Babylonia, including the texts used in the cult—the hymns, incantations, omens, rituals, and also the myths and legends which, as we now know, were also directly connected with the cult.

PHILADELPHIA, PA.

# The Political Future of the Southern Negro

BY F. M. SIMMONS, LL.D.

[The Hon. F. M. Simmons, United States Senator from North Carolina, was born and educated in the State, graduated and received his degree from its Trinity College, giving him every opportunity from life-long observation to judge of the question to which he has devoted much time, and which he treats in the following article.—EDITOR.]

WHILE the day of rancorous and mischievous discussion of the negro question, both in the North and South has not altogether past, there is a gratifying disposition on the part of the leaders of thought in both sections to discuss it more calmly, conservatively and with better temper. While the North does not admit that the negro question is an exclusively Southern question, and while it does not admit that any settlement which the South may propose of this question which does not meet the approval of the judgment and conscience of the country at large can be a final settlement, it does admit that it is a question in which the South is more deeply interested and which it understands better than any other section; and finally and of still greater importance, it shows a growing tendency to concede that the attitude of the South toward the negro is

not only honest and sincere, but that its contention as to the menace of negro suffrage finds substantial support and confirmation in the actual experience of the South and the country with the negro as a voter. The modification of Northern sentiment upon this subject as the result of better and fuller information has removed to a measurable degree the handicap to profitable discussion and possible settlement in the interest of the whole country and both races of this perplexing question, and has done more than all other things combined to remove sectional misunderstanding, disagreement and irritation.

The South is not only more interested, but it is more anxious than the balance of the country to see this question settled, not as some suppose, in the interest of partianship, sectionalism or race antipathy, but righteously in the interest

of both races, for the common weal and in consonance with the equities and exigencies of the situation.

The emancipation, enfranchisement and the permanent presence in our midst of the negro present three problems, namely, a social problem, a political problem and an industrial problem.

The social problem presented is one

course with the negro. In their view that would mean degradation for the white man, without compensating benefit for the black man; and, so feeling and believing, they desire not to see the social chasm which now separates these two races lessened, but rather to see it broadened and widened. This is a Southern condition which is inexorable, and noth-

F. M. Simmons.

which the South could and has settled for itself, independent of the rest of the country. That settlement is irrevocable and for all time. Upon that question there is not now, and there has not been at any time, any division among the white people of the South. One and all, now and at all times, they refuse, as they have always refused, and will always refuse, even so much as to consider the suggestion of social equality or social inter-

ing—absolutely nothing—can change it. It may not be, and probably it is not, in the power of the South to settle for itself independently of the rest of the country the question of political equality between the races, but it has attempted to settle that question in a way reasonably satisfactory to itself, and in a way which, if undisturbed, we believe will prove reasonably satisfactory to the North also. By one device or another we have taken

the ballot from the illiterate negro; not, as some have charged, for political or race advantage, but, as we believe, for his good and for the country's good, and, speaking broadly, for our own salvation. The manner of his disfranchisement, in some instances at least—as in the cases of Louisiana and North Carolina—may seem harsh and inequitable, but, as a matter of fact, it is neither. Properly interpreted, these apparently discriminating provisions simply declare, what experience has conclusively proven, that the negro possesses no inherent capacity for self-government such as our race undoubtedly has, and that he cannot be safely trusted with the ballot until he shows an attained capacity to use it with due intelligence and patriotism. The South's social and political attitude toward the negro, as I have just attempted on general lines to define it, can never become plain or even be made comprehensible to any one who does not understand the nature and characteristics of the negro as a race as the South knows and understands them. I mean those racial characteristics and qualities which are in his blood and which can no more be changed than the color of his skin. When this knowledge recently came to Charles Francis Adams as a result of his contact with and study of the African in Africa, the scales fell from his eyes, and he saw after years of delusion that the attitude of the South was not one of prejudice, but was both natural and logical. I quote from Mr. Adams in *May's Century*, because it is a recognition of the philosophy which underlies the attitude of the South in this whole matter:

"Looking about me among Africans in Africa—far removed from the American environment to which I have been accustomed—the scales fell from my eyes. I found myself most impressed by a realizing sense of the appalling amount of error and cant which we of the United States have indulged in on this topic (the African in America). We have actually wallowed in a bog of self-sufficient ignorance—especially we philanthropists and theorists of New England. We do so still. Having eyes we do not see. Even now we not infrequently hear the successor to the abolitionist and humanitarian of the ante-Civil War period—the 'Uncle Tom' period—announce that the difference between the white man and the black man is much less considerable than is ordinarily supposed, and that the only real obstacle in the negro's way is that 'He has never been given a chance!'

"For myself, after visiting the black man in his own house, I come back with a decided impression that this is the sheerest of delusions, due to pure ignorance of rudimentary facts; yet we built upon it in reconstruction days as upon a foundation stone—a self-evident truth! Let those who indulge in such theories go to the Sudan and pass a week at Omdurman. That place marks in commerce, in letters and in art, in science and architecture, the highest point of development yet reached by any African race. As already suggested, the difference between Omdurman and London about measures the difference between the black and the white."

"Equality results not from law, but exists because things are in essentials alike; and a political system which works admirably when applied to homogeneous equals results only in chaos when generalized into a nostrum to be administered universally. It has been markedly so of late with us."

Let me return to the question from which I have digressed, namely, the disfranchisement by the South of the illiterate negro and the proposed reduction of Southern representation.

The constitutionality of these acts has been attacked. That is a question for the courts, and we are content to leave it to the decision of the courts. But the question of reduction of Southern representation as a result of these disfranchising acts is largely a question of public policy, appropriate for discussion in the forum of public opinion. Why should our representation in Congress and the Electoral College be reduced on account of the disfranchisement of the ignorant negro? Under our present plan and fundamentally representation is and should be based upon population and not upon votes. When all adults vote there are, upon an average, four non-voters to every voter. These non-voters are as much subject to the law as these voters. Their lives, their liberty, their property, the products of their brain and muscle are as much subject to its operation as his. For these reasons these non-voters are rightfully given representation, both in the making and execution of Federal laws. We have disfranchised the negro, but we have not—neither can we—abolish him or his family.

They still exist. They are still wealth producers and wealth holders. Why, then, should these negro non-voters not have the same representation in the making and execution of national laws as is given to other non-voters? It is not a wrong

to the North, if a given number of people in the South, tho a less number of them are voters, are given the same representation as a like number of people in the North. That is self-evident. It is equally self-evident, on the other hand, that it would unbalance its Federal relations and work a grievous wrong to the South if a given number of people in the North should be given double the representation in Congress and the Electoral College as the same number of people in the South. In short, if it was wrong to disfranchise these negroes, would not the remedy proposed be a greater wrong? I do not know what may be the final outcome of this issue. I believe common sense and justice will prevail, and that in the end all parts of the country will acquiesce in the action of the South in eliminating this illiterate vote as the wisest and best possible solution of the perplexing problem. But if the worst comes to worst, if the North is determined to consider this question from the standpoint of political advantage to itself, and we must choose between reduction of representation and unrestricted negro suffrage, the South will not hesitate in making its choice; men do not hesitate in making choice between life and death, even tho life be conditioned upon oppressive terms. The negro industrial situation presents a problem that may as a result of unwise interference become troublesome. Up to the present time the negro has confined his activities chiefly to doing domestic and menial service in the North and farm work in the South. For these occupations he is fitted both by nature and long training, and in their pursuit there has been up to the present time but little friction between him and his white co-laborers. A new destiny is now projected for him. His energies are not only to be stimulated in these old lines, but also directed into new channels. We hear much these days about negro industrial education as the solution of the negro problem. Under this régime the negro is not only to be taught and trained in habits of industry, thrift and economy, and made thereby better servants, laborers and farmers, but they are also to be taught in the technique and practice of the mechanic and industrial arts and become mechanics

and artisans, skilled in the use and manipulation of tools and machinery. His education along these former lines is, in my judgment, unqualifiedly commendable, and the benefits, both to him and the country, will be incalculable.

I would not by any means suggest his exclusion from educational opportunities along these latter lines, but I recognize the existence of a racial sentiment, or prejudice, if you please, in some sections of this country, likely to become as uncompromising upon the subject of labor contact with this race as it is in another section uncompromising upon the subject of political contact with him, and for reasons not fundamentally different; and I would suggest the inquiry whether unless his training for competition in certain lines of employment shall take into consideration these actual and known sentiments in endeavoring to mitigate one assumed unfavorable condition, he may not be hurled against another condition, fraught with no good to him and much possible disturbance and danger, both to society and industry. I do not mean to say that there is absolutely no present or prospective opening in this country for negro skilled labor. I do not mean to say that the door of opportunity in this direction should be closed to him. On the contrary, I have no doubt that a limited number of negro skilled laborers may find employment, both in the North and the South, especially in the South. But when this agitation for taking the negro from the farm and placing him in the factory shall have had its fruition, where will the negro skilled laborer find work? Will the captains of industry of the North throw open the doors of their great establishments to him in collaboration with their white employees, or, in some instances, to their exclusion? Will the operatives in the coal mines and smelting furnaces and factories of Pennsylvania and Ohio and Illinois and in the cotton mills of Lowell and Fall River accept him as a co-laborer, or submit to being displaced by him as a cheaper laborer? White men in the West will not work in collaboration with the Chinaman, nor will they submit to being displaced by him. Will the white men of the North and

West collaborate with the negro? There are mills and factories in the South, as well as in the North, plenty of them—and there are going to be more of them. But in the main white men and women are doing the work of the factories of the by him as a cheaper laborer? White then, I ask again, are these negro skilled laborers and factory operatives to find employment?

With more or less intimate acquaintance with the character and adaptation and capabilities of the negro, I am profoundly convinced that he can best work out his destiny, whatever that is to be, upon the farm, and that nowhere in the world are the conditions and environments so favorable to his development along correct lines as upon the Southern farm. Here the number of laborers actually employed, compared with the number which could be profitably employed, are not only comparatively few, but there is no crush and scramble for employment, giving rise to questions of race competition and preference, such as we have on the Pacific Coast between the whites and the Chinese, or in the mines and mills of the North. Nor is farm life repressive of the best and strongest qualities in man, as is exemplified by the fact that from hence have come many of the men who thruout history have exerted a controlling influence in every line of human effort. Upon the Southern farm the negro is constantly surrounded and safeguarded by influences which tend to protect him against the temptations to which his weak and credulous nature is peculiarly subject. There he is strengthened, encouraged and supported by close daily contact with a superior race, which bears for him a sincere and genuine friendship and sympathy, and whom he respects, loves, imitates and sometimes essays to emulate. Whatever in the way of improvement and development he has achieved in the past—and it has not been inconsiderable—has been almost entirely achieved in these circumstances and surroundings. Not only for these reasons, but I think if I had time and space I could show from well authenticated statistics that outdoor life is essential to the health and physical well being of this race to a greater degree probably than any other race of mankind, and that in-

door and underground labor for him would be disastrous to his health and longevity. But I have not the time to enter upon that discussion. Nor will the moral and intellectual welfare and development of the negro in the South be neglected. To be sure the South has not succeeded in abolishing negro illiteracy; neither has it succeeded in abolishing white illiteracy; but we have done something in both directions, and under the circumstances we are not ashamed that we have not done more.

During the twenty years preceding the Census of 1900, the number of negro illiterates over ten years of age decreased nine per cent. in the South, while during the same period the number of illiterate negroes over that age increased twenty per cent. in the North. The South had expended up to 1900 since the war \$120,000,000, raised by taxation, chiefly upon the white man's property, for negro education. The total amount the South has expended for education since the war has not been large compared with the total amount the North has in that time raised and expended for the same purpose, but the amount has been fully up to our ability, and, what is more important to the present point it has been divided generally per capita between the white man's child and the black man's child. The white and the black child do not go to school under the same roof in the South, but wherever you see there a white schoolhouse, somewhere near you will find a negro schoolhouse nearly, if not quite, as good; and all over the land there are colored church buildings, to the construction of which white men and women have liberally contributed. In the courthouse justice is administered to him and the white man with an impartial hand. In an active practice of over twenty years I have appeared for hundreds of them against white men, and I have witnessed the trial of many hundred more cases between them and white men, and I do not recall a case in which he has not had fair and impartial treatment from both judge and jury.

In the midst of all this clamor for new conditions and opportunities for the negro, all these experiments and exploitations of methods and devices to make him a white man in character and capa-

bilities. I give it as my deliberate opinion that the South and the farm are the best place and occupation for him. Many of them are independent landowners. More of them will be. His condition may not yet awhile be well enough to be altogether let alone, but he is surely advancing to that condition, doing the work his hands know so well how to do, and which he is contented and happy in doing; meanwhile growing and strengthening, not by artificial, but by natural processes, in the fundamental attributes of better and higher citizenship.

Take him from the farm, carry him to the great city, place him in the factory, organize him into labor unions, and his

individuality, which is at best small and weak, will be destroyed; his identity will become merged in the common mass, and his strong tribal propensities brought with him from the jungles of Africa will undermine and supplant many of the virtues which are now his best and most valuable asset—virtues not hereditary and inherent, but which have been imbibed by close sympathetic contact with the white man on the farm—and it will be a marvel if his last state is not worse than his first, if in attempting to avoid the erroneously supposed Scylla of his present position he is not stranded upon the certain Charybdis of the other.

WASHINGTON, D. C.

# The Comforter

BY ELIZABETH AKERS

AUTHOR OF "ROCK ME TO SLEEP, MOTHER."

No mortal loved her; she was one  
Who labored on, day after day,  
At daily duties never done,  
With neither love nor thanks for pay;  
And yet the mightiest comforter  
In all the world was kind to her.

He came when all the house was still;  
Even the shadow of the vine  
That fell across the window-sill,  
Cast by the moonlight's yellow shine,  
So silent, peaceful, and so fair—  
Lay still, as it were penciled there.

Her house-mates slept, all unaware;  
They heard no sound of ring or knock,  
No press of foot upon the stair,  
Nor cautious grate of bolt or lock;  
For he whose errand none may stay  
Waited for none to show the way.

He touched her forehead—and the trace  
Of care and sorrow, loss and pain  
Was not; the worn and furrowed face  
Took on the look of youth again;

He pressed her lids so close, I ween,  
That no more tears could flow between.

He touched her heavy heart; and lo!  
The burden and the aches were gone!  
No more sore throbbing would it know—  
No more go laboring on and on;  
No longer feel the dagger-thrust  
Of harsh neglect, or blame unjust.

The moonlight fell across her bed,  
Touching her still and pallid face  
Whence bloom and brightness long had fled,  
Bestowing there a tenderer grace,  
And almost to the faded hair  
Brought back the gold that once was there.

Ah, many a time with secret tears  
She said, "The days are wearisome;  
So many years—so many years!  
And yet—and yet—he does not come!"  
Now he was here, and all was well—  
The healing angel Azrael!

TUCKAHOE, N. Y.

# What Can a Young Man Do?

BY FRANK W. ROLLINS

EX-GOVERNOR OF NEW HAMPSHIRE.

WE are confronted every day by the statement that times have changed; that the era of self-made men has ended; that the old-time opportunities for a poor boy have almost disappeared; that the avenues formerly open to an energetic young man are closed. Every man holding a prominent position is frequently asked the question which heads this page.

It must be confessed that it is pretty hard to answer some of the men who ask the question, because they do not seem to be fitted for anything, nor to have the qualities which make for success in any calling. One great trouble, and one reason why the answer to the question is so unsatisfactory to some, lies in the fact that many of the seekers for light and employment are of very poor material naturally; that they have not been brought up to work; that they are superficially educated; have no thoro knowledge of anything, and that they have no vital force. But granting that they have some or all of the qualities necessary for success, what then?

My belief is that instead of less opportunities, there are more. There is today a greater variety of enterprises; a larger number of kinds of business into which a man may go; there are a great many avenues for work which did not exist in our forefathers' day.

I am going to enumerate a few of the openings and opportunities which exist today for a young man just starting out in life, and you will observe that *most* of them did not exist twenty years ago, and were not open to our forefathers.

*Electricity.*—Here is a new field, with boundless opportunities, not only for work, but for new discoveries and new inventions. Here is a realm of opportunity which seems almost like a fairyland to the man of inventive genius; and even to the man without inventive genius

who has energy, enterprise and a willingness to work, there is a broad field of opportunity. In every part of the world electricity is taking the place of gas as an illuminant. Modern buildings are not even piped for gas, electricity being relied upon entirely for illumination. Every city street glares at night with great electric signs. The streets of our cities, and the subways, to say nothing of the elevated railroads, are traversed by the flying electric car, and the growth of interurban roads, particularly in the West, is something phenomenal. From all the large cities electric lines are radiating, bringing the smaller cities and towns within a radius of a hundred miles into close touch with the metropolis, allowing for better markets, better school privileges, and the benefits of the lecture, the concert and the theater.

Busy engineers are hunting the country over for water-powers, for by modern engineering methods this power can be converted into electricity and conveyed hundreds of miles and applied in distant towns and villages. Water-powers which were far from any inhabited town, and apparently useless, are by this means becoming of enormous value.

*Forestry.*—Here is another field which was not dreamt of in this country a few years ago. Until very recent years our forests were treated as our enemies, and, not satisfied with cutting them down as fast as we could, we frequently deliberately set fire to them in order to get land for raising potatoes. Such wanton destruction is now almost inconceivable, but we are doing things nearly as bad in our forest domain at the present time, and we shall awake to a sad state of things within a few years. Here and there a State or an individual has seen "the handwriting on the wall" and is making an effort to stem the tide and introduce methods of reform. But it is largely a case of locking the door after the horse has been stolen, for the great forest States of Minnesota, Wisconsin and

Michigan are today practically denuded of their former forests. The great Coast States of Oregon, Washington and California are being devastated as rapidly as the ingenuity of man can bring it about. Nothing has prevented the utter denudation of New Hampshire and Maine but the fact that their soil produces trees more rapidly than that of the Western States.

The National Government has taken a firm stand in favor of reform and has organized a forestry department, with a very able man at its head. Several of the State Governments have followed suit. A good many of our colleges have opened forestry schools, and from now on we are going to hear a great deal about forestry and reforestation in these United States. Here is a splendid field for a young man who is fond of outdoor life. Let him attend one of these forest schools; then, if possible, serve for a year or two in the United States Forestry Department, or in some State Forestry Department, and then he will be in a position to get a good place as forester for some State or some large lumber concern, or he may be placed in charge of some reservation. There are good opportunities and a future in this business. It is also one of the most delightful employments imaginable. What could be more attractive than such a life in the open?

*The Consular Service.*—The consular service has until recent times been used as a reward for party service, and it has been rather the laughing-stock of our own people as well as foreigners. This, however, is changing rapidly. It is not at all unusual nowadays to hear of promotions, and to see good men kept in office without regard to their politics. The country demands reform in the consular service, and that our best men be sent abroad as ambassadors and consuls, and what the people demand is bound to be brought about, sooner or later, and you may rely upon the fact that within a few years merit alone will be the open sesame to the doors of the consular service. Here is an attractive field for an ambitious fellow. Let him get the best education he can, of course acquiring as many foreign languages as possible, or at least the rudiments of them; let him

study political economy; let him saturate himself with history, and, above all, let him keep himself abreast of the times and know what is going on in the world.

*Politics.*—It is a strange thing, that in this country, where really the best opportunity in the world exists for advancement thru politics, very few young men ever start out with a deliberate intention of becoming politicians, fitting themselves for the service of their State or their country. In most foreign countries men are carefully trained for public service. But when you think over your friends at school or college you can hardly remember one who was deliberately preparing himself for public life. Our politicians (and when I speak of politicians I mean politicians in the best sense of the word) have generally been lawyers, simply because by their training they were better fitted for a political life than was the farmer, mechanic or business man. Within a few years, however, we have found men coming to the front who have deliberately prepared themselves, by a thoro education, by study and by service in the party ranks, for public life. We have at the present time in the presidential chair a bright and shining example of such a man. We cannot all be Roosevelts, but he is a splendid ideal to follow. There is nothing magical about his success. It was not a matter of luck, for he deliberately prepared himself for a public career. Starting at the lowest rung of the ladder, by energy, ability and his careful preparation he finally reached the very top-round.

One of the great requirements for a public career is ability to talk well upon your feet. One may be ever so ready a writer; one may be ever so conversant with political subjects; but if he is not able to forcibly and clearly demonstrate these qualities upon his feet he falls far short of being well equipped for a political life. As you look about you, you find very few good speakers. You probably could count upon the fingers of one hand those whom you know. It is in some respects, of course, a gift, but it is possible for a man of moderate ability in this line to cultivate that talent and immensely improve it. If one has the capacity to speak fluently and well he has

gone a long way toward success in politics in the United States. He must, of course, have something to say; but if he has something to say, and can say it forcibly and readily, he will get an audience. I believe there is no field which offers less competition or quicker promotion today than the field of politics. Our people are so busy with their own affairs that they leave their politics to the ward heeler and professional politician. Such

It will take twenty-five years, at least, to complete the work now in sight in this line. There will be excellent openings for any man who makes a thoro study of the theoretical and practical side of this subject.

*Journalism.*—Some of the brightest minds in this country are today employed upon its great newspapers. It calls for a high degree of intelligence, keenness of perception, readiness of wit,

Frank W. Rollins.

men cannot compete for an instant with the men trained for public life, like Roosevelt. He has them "down and out" at the start.

*Good Roads.*—Here is another field rapidly developing and full of great possibilities. We have very few road engineers in this country. Nearly every civil engineer thinks he knows how to build a road, but very few have had any practice. Almost all of the States are now entering upon a system of road building.

and an excellence of judgment of an uncommon order. Our great daily papers wield an enormous influence, and they are ever ready to see the ability of young men and reward them by rapid promotion. No kind of knowledge comes amiss in journalistic work, and the man of broadest knowledge and widest experience, if he is able to use and apply his knowledge and experience, will be the most valuable. The editors of our great papers hold high rank in the country,

and it has been noticed that they are frequently selected for high official positions in political life.

*Stenography*.—This is a profession usually taken up by young women. For some reason men rarely enter it. Just why, I do not understand, for I believe it is a means to a most desirable end. There are greater possibilities in stenography for a man than for a woman.

A man who is a first-class stenographer, and who is, in addition, well educated, can frequently get a position as secretary to some man holding a high position, such as the president of a railroad, a manufacturing corporation, or a cabinet officer. Such positions cannot be held by women, as a rule.

When a young man obtains such a position it almost invariably leads to his promotion to a very much higher sphere of work. The relations between a secretary and his employer are very close and very confidential, and if the secretary shows that he is made of good stuff, and has a good mind, it is the most natural thing in the world for his employer to take an interest in him and see that he is promoted.

A great many of the heads of departments in Washington today started out as private secretaries in the departments which they now control. It is a very common occurrence to hear of the head of some great corporation who made his start as private secretary to some predecessor. It seems to me that it is a short cut to eminence.

A peculiar thing about it is that comparatively few men study short-hand. If you do not think this is true, try to find a first-class male stenographer. A knowledge of stenography is also a very valuable asset to a man in business, or in any of the professions, even if one does not practice it for a living. Male stenographers who hold positions in the various State, municipal and Government courts are well paid.

*The Church*.—A largely neglected field of opportunity is the church. Not that it offers brilliant rewards pecuniarily, but it does give a man his hearing, his audience, his opportunity. If he has a message to deliver, the church offers a field as wide as the world. On account of the mediocrity of many men in the min-

istry, the chance to excel is wide open and easy. In the early days the church was esteemed the foremost of callings. Is it not possible to place it in the van once more? If the best man mentally in our colleges would seek it instead of the third and fourth grade men there would be an immediate awakening.

*Settlement Work*.—Here is another new field that has developed within the last quarter of a century, and from which surprising results have flowed. For many years this work has been largely confined to the slums of our great cities, and hundreds of devoted men and women have given their best years to such self-sacrificing work. This is a field that offers few attractions to ambition. He who enters this field simply gives his life to self-sacrifice. But there are those who have aspirations in that line. I would call attention to the fact that there is a broad field for this work in the country as well as in the overcrowded city. In all of the older States of this country there are little towns and villages (perhaps away from the railroad), where the population has been gradually diminishing, the young men and women being drawn to more attractive fields and larger opportunities. In these towns the pulse of life is running low, and there is great need of an uplifting hand. Not only has the best blood been drawn from these towns for generations, but there has been no new blood introduced, and those who have been left behind, being the least strong, the least ambitious, the least effective, have married and intermarried until the breed has run out. There is as much need of settlement work in such localities as there is in the cities, and even more, in my judgment. For the cities are recruited from the country, and if the springs are polluted, the great watercourses are bound to be foul.

*Farming*.—One of the best opportunities open to the young man today is the very ordinary but very necessary field of farming. And by this I do not mean simply going out and planting a few beans, a few potatoes and a little corn. I mean the selecting with care of a suitable piece of ground of limited area, and finding out what the soil is suited to produce, and then planting and raising

that to which the soil is adapted. I mean the selecting of a locality where a market is obtainable without expensive shipment, and the raising of fruits, vegetables and berries. I mean the getting your crops to market before the other fellow does and getting a bigger price. I mean the raising of a richer and more luscious strawberry than anybody in the neighborhood, or a finer and more beautiful apple. In other words, I do not mean at all farming as it was understood twenty-five years ago, but modern farming, trained farming, in which the brain works as well as the hands. There may not be large fortunes made in farming, but there is certainly a great deal of money awaiting the man who will do it intelligently, and more than a good living. And, in addition to that, it is a fine, healthful calling, one which brings out the best that is in a man, and is the most independent existence we know of.

So I maintain that, instead of being fewer opportunities than there were in the old days, they have multiplied; that there are many fields open now which were not open to our fathers and grandfathers. There never was a time when there was such a demand for good men, for men fitted for positions, for men who have vitality and energy and who know

their business. There is not a great manufactory or mercantile house or bank that is not constantly on the lookout for good men. They are willing to pay five times the salary which similar men would have received twenty-five years ago. In fact, a man with the right stuff in him can almost fix his own salary. Many of the fellows who cry that there are no opportunities are poor, weak things. The trouble is in them, not in the times. There are really not enough good men to do the work. The demand exceeds the supply. The difficulty is that the applicants are immature, half-educated fellows, expecting to jump right from school or college into highly lucrative positions. They are unwilling to go thru the drudgery necessary to fit them to hold high positions. They shy at the hard work and the rough usage of the world; they expect to sail into a competence by some course of magic, but it doesn't work. They see other men forging ahead of them, and they begin to wail about "the change of times" and about "lack of opportunities," while the difficulty lies largely in themselves. Brains are at a premium, dullness at a discount. Vital force is necessary to success.

CONCORD, N. H.

## The Heart of Mystery

BISHOP H. W. WARREN

CHAOS confused contained the ordered world.

The dark beyond the spectrum's gorgeous glow  
Is just as rich in thought as where unfurled

The rainbow's banners God's own symbol show.  
Since then all darkest depths bright glories hide,

And earthiest earth yields many a radiant rose,  
Behind each veil we'll wait a blushing bride,

Pierce all the mists and come where God's face glows.

UNIVERSITY PARK, COL.

# President Roosevelt's Retreat at Pine Knot

BY HENRY HALE

PROBABLY no ruler in the world has such a modest country home as the President of the United States. It is situated in the heart of the wilderness, in the State of Virginia, and is called Pine Knot because it is nearly hidden in a clump of trees. The house was partly built of the timber of trees cut in the woodland to make a clearing for it, and the porch in front is supported by posts of these trees left in their natural state.

The Roosevelt home is so far away from the nearest railroad that the President and his family are obliged to ride horseback or drive in a vehicle for sev-

eral hours after leaving their car to reach it. The nearest community of any size is over twenty miles distant, and so few people live in this part of the United States that between the town and Pine Knot only about ten houses can be seen.

This quiet spot was selected for a home by Mrs. Roosevelt. The house cost actually less than \$500, for many an American laborer and farmer lives in a far better dwelling. The people in the vicinity have much larger houses, but it is comfortably furnished and has a large open hearth, where a fire is always burning on cold days and in the evening. The house has but four rooms and a small shed, where the meals for the President's family are cooked by the one

The Porch with Its Pine Tree Posts.

Front of House Showing Trees Cut Down by President Roosevelt.

servant. At times Mrs. Roosevelt, who is an expert in *cuisine*, prepares the meal with her own hands.

The next door neighbor is a lithe and clear-eyed mountaineer, whose affairs have prospered until he owns a house that cost at least two thousand dollars. He is one of the most prosperous residents of the section, is Sam Hoffman, in his two-thousand-dollar mansion. But Sam takes off his hat when he meets his neighbor.

If you were riding that way, and chanced to see this refuge chosen by Theodore Roosevelt as a country place, you would think it the clearing and the home of a settler carving out his humble niche in the wilderness. And if the owner is there, you may see him laying his axe, with sturdy arm, into the butt of a pine which must give way to make way for his clearing. Just woods, and the smell of fir, and the mountain winds, and a roof for shelter, and a joyous solitude—these are what the President sought and found in his nook of the woodland, which is dignified among the

mountaineers by the name of "Roosevelt's Rest." This is no specious imitation, with all "modern improvements," such as many city dwellers delude themselves into believing is "getting into the country." Here you will find no automobiles, and fashionable "week end parties." It is the sort of a place within the reach of any man on living wages. This is not the kind of territory that any one would seek out as a refuge from care and work unless his love of nature were genuine; unless he wished the "real things," and these only. The nearest trolley line is fifteen miles across the hills, and Scottsville, the only town within driving distance, is an hour away. If the larder is empty, Wilmer's store can be reached in half an hour on horseback at the "Corners." Wilmer's carries a limited stock of potted ham, pork, codfish, crackers and ginger snaps, but does its heaviest trade in axle grease and cartridges. If the President wishes a more varied assortment, he must ride on to Scottsville.

There are no markets, no cold storage plants, no telephones to the butcher, the

hiker and the ice-man. But everywhere is the higness of the outdoor world, mile after mile of walking and riding without sign of human handiwork except the infrequent cabin of the mountaineer. In this Piedmont region of Virginia, every man's hand is outstretched to the stranger, every latch-string holds a welcome, and there is no trace of the civilized hostility and distrust between man and man. The President of the United States is "Neighbor" Roosevelt wherever he may wander around "Plain Dealing" Plantation. And because he chooses this kind of life and this unadorned simplicity of living for his recreation hours, he unconsciously sets his fellow citizens an example of sterling value. So-called

"country life" has been made a good deal of a farce by the rich who build themselves huddled palaces and call them "cottages"; who call it "vacation" to spend the summer at Newport and the winter at Palm Beach; who take their pleasures in droves, with prodigal ostentation of outlay, and who talk of "the simple life" as if they really had a notion of what the words mean.

The house is located about 150 miles from Washington, and the President and Mrs. Roosevelt are fond of going there for three or four days occasionally to rest. They ride horseback, hunt and take long walks for exercise, and occasionally join their neighbors in following the hounds.

BALTIMORE, MD.

## Why I Gave Up My Practice

BY A LAWYER

[A year or so ago we printed an article by a clergyman entitled, "Why I Gave Up the Ministry," which provoked a great deal of discussion within and without the profession. We presume this article will excite a similar amount of interest, and it leads us to wonder if any of our readers have had similar experiences in giving up other professions or vocations.—EDITOR.]

ALMOST from my cradle I was destined for the bar. None of my ancestors had been lawyers, but it was my father's earliest ambition to become a member of the legal profession. He was one of the thousands of young men whose destinies were changed by the American Civil War. Just as he reached the age at which preparation for a profession usually begins, he answered his country's call and when the struggle was over, nine months of confinement in Libby and Belle Isle had so shattered his health as to make a sedentary occupation almost an earnest of an early death.

I was an only son, and my father reconciled himself to the abandonment of his ambition by postponing it for a generation and transferring it to me. I was also an only grandson, and all the uncles and aunts agreed that as I was likely to be the last of the family I ought to enter the profession which afforded the best opportunity for distinction.

I have often thought how much better fitted than I my father was to distinguish himself in any profession. A born leader of men, of commanding presence and natural eloquence, he has left the impress of his personality upon every enterprise in which he has engaged. Thanks to his perseverance and business sagacity he was able to give me a liberal education; and after graduating from the high school in my native town I matriculated in one of our smaller colleges which had a national reputation as the *alma mater* of many distinguished men, whose greatest heritage from their college was thoroughness and self-reliance.

From this institution I graduated with some distinction and then took up the study of my chosen profession in the law office of two of the highest minded and most thorough lawyers it has ever been my fortune to meet. The head of this firm was a man of some means and he practiced his profession from the ideal stand-

point of love of the profession rather than a desire for gain.

The year which I spent in this law office yielded me a reasonable amount of legal knowledge, but my greatest gain was a thoro grounding in the ethics of the profession—ethics as they were applied to everyday practice, and not as they appeared upon the cold pages of legal text-books. My preceptors practiced law according to old fashioned standards—they employed no “ambulance chasers,” no police court hangers on. To solicit business reduced the profession, in their eyes, to the sordid level of commercialism. Whoever came to them in need of legitimate legal counsel received their best, nor was I ever able to detect any distinction between the services rendered a corporation with a plethoric treasury and those accorded the poor widow whose husband’s life had been crushed out in earning corporate dividends.

I have often wondered whether the training which I received in this office constituted the best foundation for the practice of the law as it is practiced today, but I have never for a moment regretted that year’s association, for I know that it has made me a better man.

The following year I entered one of the leading law schools of the country, whence I emerged at graduation with about as much theoretical training as one could well acquire in the time consumed and about as little preparation for actual practice. However, my year’s clerkship in the law office, together with the intervals spent in the courts, probably gave me as much practical preparation for the profession as the average attorney has when admitted to the bar.

After the usual amount of hesitation in the choice of a location, I finally decided to remain at home. I had an offer of a salaried position in the office of a prominent firm of attorneys in one of our largest cities—a firm which has built up an enormous corporation practice since the “day of concentration” began. The young lawyer who accepted this position is with the firm yet, earning a good salary, but his name does not appear in any of the firm’s transactions, and what he accomplishes brings him no distinction whatever except that of being a living

example of how some men live by the sweat of other men’s brows.

My first law office consisted of a desk, bookcase and two chairs in the corner of the office of an older lawyer. I found, however, that I had plenty of room to accommodate all of my clients. I was only twenty-three, and whatever advantages there may be in being a “boy orator” or boy wonder of any kind, I did not discover any great inclination on the part of men of affairs to entrust them to a boy lawyer. If I remember correctly my first year’s expenses somewhat exceeded my income, and I had plenty of time for study and research independent of that required by the cases in which I was retained.

The spare time which resulted from the meagerness of my practice also afforded me a good opportunity for observation. I associated with other lawyers and I began to study their methods in my desire to learn how to increase my own practice. The first years of my professional career were also the darkest years of the great business depression, but following these came the years of business revival when the great trusts and combinations were being organized.

I soon began to observe that a very few law firms figured in nearly all these organizations. I also noticed that these firms, in nearly every instance, included attorneys who, in some way or other, by kinship or marriage or business relationship, claimed some connection with the capitalists who financed the corporations. I observed that in some cases lawyers of only mediocre ability were taken into well established firms for no other apparent reason than that they had some sort of a “pull” with men of means, and it usually followed that other lawyers of greater ability, but fewer connections, became satellites of the firm and contributed the greater portion of the brains, with only a fair reward in salary and none whatever in recognition.

More than ever it became the fashion for sons of wealthy families to be educated for the bar, and when their education was completed their fathers would exchange their legal patronage for the sons’ membership in the law firm. As business concentration progressed I noticed that the prestige of some law firms

seemed to wane, while that of others increased according as some were more closely in touch than others with the captains of industry."

Once I had occasion to call at the law office in which I had been offered a salaried position. At the time of my first visit this firm had a very modest office with one or two stenographers and a very ordinary office boy. On my second visit I was surprised to find the members of the firm almost inaccessible, surrounded by salaried assistants and numerous clerks, the office being equipped with a private telephone exchange and a colored porter in a gorgeous livery who took my card thru a maze of inner offices to the *sanctum sanctorum* of the head of the firm. Then I recalled that the head of this firm was the scion of an old and wealthy family and that his partners had both married into families of wealth and influence.

Thus I realized that it was becoming increasingly difficult for a lawyer without connections to obtain the clientage of the larger corporations unless he was willing to do so as the hired assistant of another. When I turned my attention to the smaller business concerns I found not only that they were in many instances losing their identity by being merged in the combinations, but also that owing to the passage of one particular statute they were having less and less need for legal advice. The bankrupt law was enacted a few years after I began to practice, and whatever may be said for and against it as an equitable measure it cannot be disputed that it is a great saver of litigation. Under the laws prevailing in many of the States, a failure formerly meant a host of clamorous creditors, each appearing by his attorney in the effort to obtain some sort of a preference for his claim over the others. The bankrupt law, which invalidates preferences, has reduced to a minimum the possibility of securing an advantage by the employment of an attorney. Properly filing the creditor's claim in the bankruptcy court is all that can usually be done, and any collection agency can do this.

But the greatest shock to my preconceived ideas of the profession was the manner in which many even of the more

prominent lawyers secured their cases. Instead of finding the attorney who solicited business shunned by the profession as a pettifogger, I found him in nearly every instance tolerated and often sought after as a desirable professional associate. The old fashioned principle which forbade intercourse between the parties to a suit except thru their attorneys seemed antiquated indeed. In cases of personal injuries the person injured, or his family, if his injuries were too severe to permit him to be interviewed, had a hard course to steer between the Scylla of the attorney sent by the corporation to settle with him for a nominal sum before he should ascertain what his legal rights were, and the Charybdis of the professional brother who followed the ambulance to the hospital in order to be the first applicant for the job of bringing suit against the corporation. To me there seemed to be little distinction in principle between the "ambulance chaser" and police court *habitué* who did their work in person and the more advanced practitioner who operated by proxy only.

I do not wish to be understood as attempting to convey the impression that all lawyers, successful or otherwise, resort nowadays to practices of this kind. Many, probably the majority, do not. But there can be little doubt that between the so called "corporation lawyers," who don't solicit business largely because they feel that their connections make it unnecessary for them to do so, and the "personal injury" lawyers who do solicit because they think they can't get it in any other way, the lawyer of the old school is finding it increasingly difficult to secure or maintain a foothold. As I heard it expressed by a professional brother, the lawyer who lives by his practices is every year making harder the lot of the one who strives to live by his practice alone.

While I was observing these things I was making every effort which seemed legitimate to build up my own practice. I did not solicit business nor attempt to foment litigation, but I did apply myself to the study of the law, to the cultivation of acquaintances and the most careful attention to such business as came into my hands. I was regular in my office

hours and made it a rule never to delay giving my attention to matters at hand, no matter how irksome they might be. I went into society enough to keep in touch with other people, but I did not allow social duties to interfere with professional engagements. I joined one or two orders and took an active part in them. I even became active in politics, but I did not run for any office except such as could be filled only by a lawyer, and I found temperate political activity the best means of becoming acquainted with the masses.

But despite all these efforts and despite the fact that I was rather more than ordinarily successful in winning what cases I had, my practice increased but slowly. When I attempted to analyze the situation for the causes of my poor success, I discovered that my experience corresponded with that of practically every young lawyer of my acquaintance, except the few whose "connections" had made them members of established firms. The practice of the law, as well as business, was being concentrated in the hands of the few, and law was being practiced along business rather than professional lines. The lawyer of today speaks of his "business" more frequently than of his practice.

Five years after my admission to the bar I married. In this I may have been unwise from a purely material standpoint, but I have not observed that even in this commercial age men and women in love are any more prudent than they used to be. The maintenance of a household increased my expenses, but my professional income did not increase proportionately and I soon found it necessary, in order to make ends meet, to embark in enterprises outside my practice. In these I was rather successful, and derived some income from them, but I soon realized that I could not do both and do them well. I had reached the parting of the ways and must decide for one or for the other.

At this crisis and in the rigid analysis to which I subjected myself, I came to a realization of the causes of my failure. I was attempting to practice, according to outworn standards, a profession which had put off its old garb; a profession from which professionalism had

departed, and in which a new code of ethics and new standards of conduct had been set up. The law, still denominated a profession, had become in reality a business. The old code which prevailed when attorneys "rode the circuit" with their briefs in their saddle bags and when the greatest legal talent was displayed in the courtroom, had become archaic. Still prevailing to an extent in rural districts, it had no adherents among the new school—the school in which salaried assistants prepared the pleadings and tried the cases, and in which the heads of the firm were strangers to the trial table as well as to many of their clients.

What was I to do? The "new practice" had but feeble attractions for me, and in addition to that I found that I had missed my chance to become a salaried assistant because I had waited too long. Young attorneys were wanted, just admitted to the bar, who would accept an initial salary on which a man with a family could not live. I could indeed continue as I was with a small practice and eke out my existence from outside sources. I could even hope that my practice would show some small increase from year to year, but I could see but small hope of earning any of the large rewards of the profession beyond the satisfaction of practicing it according to the standards in which I had been educated. This satisfaction would mean much morally, but materially—well, a man can't live without dining and his children must be clothed. Even Socrates required an upper covering, barefooted as he was, and despite his frugality he died owing a cock to Æsculapius.

Experience and observation and the hard pressure of necessity had reduced the situation to a very simple dilemma—commercialism in the profession or commercialism out of it. The former involved a smaller departure from existing circumstances, but a greater departure from existing ideals. If I attempted to follow standards which I believed to be wrong the subjective effect would be the same whether they were actually wrong or not. Probably no great moral problem was involved, but even in small things I preferred to be at peace with myself.

So out of these circumstances and this

process of reasoning I took my decision.

I was not without initiative and aggressiveness, and if these were required I would employ them where there could be no doubt of their legitimacy. In the business world advertising pays and the man gets the orders who goes after them, and there is no code of ethics except the plain standard of honesty. I knew many successful merchants and manufacturers whose careers began at the bar, and with these in mind I awaited my opportunity.

It soon presented itself in the form of a factory whose capital had all been expended on equipment, with no reserve for carrying on business and no executive to direct it. I borrowed enough money to supply the deficiency in capital, which was a potent factor in persuading the stockholders that I had also the necessary executive ability to supply the other deficiency.

Thus I crossed the Rubicon. That was four years ago, and tho success would not necessarily justify nor failure of necessity condemn my decision, it may not be amiss to say that I have succeeded

in business. Not that I have yet accumulated a fortune — far from it, and perhaps I never shall. But I have come to realize that even in business there is something more than money, and that is the joy of accomplishment, the fascination of "playing the game" and playing it to win, and the satisfaction that one has in building up an industry into permanence and distinction.

I would not be honest if I should say that I never regret. There are times when the longing for my briefs is very strong; occasions when I even question the wisdom of the step which separated me from them. If an actor can never entirely forget the fascination of the footlights or a plainsman the odor of the sage brush, how much more difficult it is to turn one's back upon a profession in which keen intellectual enjoyment is added to the joy of striving and the glamour which attends success. But after all "peace hath her victories," and there would be no need of lawyers if there were no captains of industry. I am not yet a captain, but in the great industrial army most of the captains have been promoted from the ranks.

## Why Norway Is Not a Republic

BY THEODORE STANTON

[The author of the following article has lived for many years in Europe, and is personally acquainted with many of the republican leaders in Norway. He played a part in the movement in France last summer to aid the Norwegian republicans to bring about the establishment of the republic in their country.—EDITOR.]

ON June 7, 1905, the Storting, or Norwegian Parliament, declared dissolved the union with Sweden, and on August 13 following the people of Norway, thru a *referendum*, approved the course of the Government by an overwhelming majority. The chief question then was whether the new state should be a republic or a monarchy. There can be no doubt that at this moment Norway, taken as a whole, was Republican. A few facts in support of this assertion may, however, be given.

Writing from Copenhagen as late as

September 26, 1905, Professor Calvin Thomas, of Columbia, said in the *New York Nation*: "From personal observation, I surmise that there is a clear preponderance of sentiment in favor of a republic." A few days after the declaration of independence Björnstjerne Björnson, passing thru Paris on his way home from Rome, said repeatedly to his friends in the former city: "This means the republic in Norway." Writing in *THE INDEPENDENT* on July 13, that is, about a month later, he declares that "the spirit of the Norwegian nation is indu-

bitably republican," and then went on to say that if the Kings of Sweden and Denmark both refused to let one of their sons mount the Norwegian throne, "we will declare for the republic. This last course will depend upon circumstances, but I think that public sentiment favors the republic." One of the veteran politicians of Norway, John Lund, wrote me on August 3, 1905: "In case the Norwegian people should vote on the question of kingdom or republic, I feel sure that the majority would be for the latter." More than a month later, on September 6, he again writes: "Regarding your remarks concerning the republic or a kingdom, I dare say that the majority of the Norwegian nation is for the republic."

The question may now be fairly asked, Why, then, if Norway was so republican, did she decide to set up a monarchy? The answer, or, rather, the answers, to this question are easily found. In the first place—and this fact with its consequences was the chief cause of the change in public sentiment—from the moment that Norway declared her independence from Sweden, at the beginning of June, until the end of September, when the Karlstad Conference put a period to the danger, there was the possibility of war breaking out between the two countries. That this did not happen was in no small measure due to pressure from without. Whence this pressure principally came and what its effect was on the public mind of Norway comes out in this extract from a letter of John Lund, dated October 11, 1905:

It is said that King Edward has, during the present crisis with Sweden, rendered Norway great services, and many think that England would be an excellent ally for Norway and a protector against Russia. Hence there is a feeling here that Norway should continue to be a monarchy; and in case Princess Maud were our Queen, we could the more easily secure a good alliance with Great Britain.

That England was the champion of Norway last summer, and for a purpose, there can be no doubt. I will cite but one of many proofs of this. In the London *Times* of September 9 last appeared the following letter, signed "Navalis," which was unquestionably written or inspired by the editor or the Foreign Office, or, which is more probable, by both:

In a recent issue of the *Novoe Vremya* an account is given by a Russian correspondent who has been visiting the Scandinavian capitals of a conversation with Mr. Franz von Jessen, editor of the *National Tidende*, of Copenhagen. In the course of that conversation Mr. von Jessen is represented as having said that there was no hostility in Norway toward Russia, and that Norway's feelings for Russia had always been of the most cordial description. In support of this statement Mr. von Jessen referred to a conversation which he had had with Professor Nansen, in the course of which the famous explorer said: "If Russia takes one of our fjords I don't care; we have so many, and have no use for all of them."

The accuracy of this conversation has been denied by the Norwegian paper *Verdens Gang*, and Mr. von Jessen has also stated that no such statement on the part of Professor Nansen has been published in the *National Tidende*. But surely Professor Nansen himself owes it to his English friends to deny or to explain a statement which must, if left uncorrected, cause the future foreign policy of Norway to be viewed with some apprehension in England. He cannot be ignorant that the cession of a naval base in Northern Norway to Russia would be highly detrimental to the interests of Great Britain. I should, therefore, like to ask Professor Nansen whether he has ever expressed the opinion that a fjord in the north of Norway could without much harm to herself be ceded to Russia, and, if so, whether he is prepared to hold to that opinion?

Dr. Nansen, who was Norway's confidential agent in London during the crisis, and who is now her accredited Minister there, forthwith replied thru the columns of the same daily as follows:

"In order to satisfy your correspondent and others, I will lose no time in publicly declaring that I never made any such statement, and that the idea of the cession of an inch of Norwegian territory to Russia or to any other Power is utterly repugnant to me and to every true Norwegian."

The present tendency toward a *rap-prochement* between England and Russia did not then exist, nor could the Norwegians then foresee what has since happened at Helsingfors and at St. Petersburg. Today, Finland, on Norway's very borders, is again free, and a constitutional government for Russia is near at hand. But at this moment last year Russia was a real danger to Scandinavia, and hence the prime importance of English good-will. Hence also, the main reason why so many Norwegian republicans laid aside their republicanism for the nonce.

But England was not the only European country interested, for more or less

selfish reasons, in the future of Norway. Germany, too, wished to have a friend on the north. But England then, as now, was not on good terms with Germany, and what was more, France and Germany were on the verge of war, and France saw a German danger everywhere. So France was only too glad to aid her friend England to become dominant in the new independent state. But at first republican considerations had their weight in France. As late as September 20 the semi-official *Temps* said editorially:

"The only solution of the Norwegian problem which would be frank and clear would be the establishment of the republic. . . . If any form of government suits Norway, it is the republican. . . . The monarchical feeling has disappeared there."

But this view suddenly changed, and the French Government and Parliament became ardent supporters of the candidacy of Prince Charles of Denmark, that is, the son-in-law of King Edward. This view comes out well in the following letter, which I received on October 23 from M. Jules Siegfried, a prominent member of the Chamber of Deputies:

The matter appears to be settled and the acceptance of the Danish prince seems beyond doubt. I may add that, bearing in mind his connection with King Edward, it is a victory for England. Should we not, you and we Frenchmen, rejoice that the influence of our English friends has outweighed there the ever-threatening influence of William II? Of course we should have preferred to see a republic in Norway, but I do not think it is any longer the moment to say so.

Among the members of the Norwegian Government at this moment was Mr. Gunnar Knudsen, Minister of Finance. Like several of his colleagues, he was a republican; but unlike the others, he stood by his convictions. So when, on the eve of the final November *referendum*, he saw that the Government would not adopt an impartial course, but was determined to side with the monarchy, he resigned, signed an address to the republicans of Norway, and did what he could to influence the popular vote. The following letter, which he sent me the day after the *referendum* that called Prince Charles to the throne, throws still further light on the causes that effected the Norwegian electorate:

I am sorry to say that the present situa-

tion in Norway gives no hope whatever to us republicans. As you are well aware, Norway has this year gained full independence from Sweden, and the mass of Norwegians, who are a very cautious people, have evidently thought to find greater safety for the country against possible risks from future international complications in a monarchy with good family connections, than in a republic without such connections. Of course this fear and this hope are, in my opinion, utterly false; but, nevertheless, there is no doubt that this reasoning has been very generally accepted by the people.

This extract from John Lund's letter of September 6, from which I have already quoted, takes a somewhat similar view:

The monarchical institution long ago played out its part in Norway, and if it should happen that in the end we should decide to give it another trial, this act will be due more to the fact that we are face to face with surrounding powerful monarchies than that the monarchical idea awakens any special sympathy among the Norwegian people.

The long Norwegian winter was beginning, and this constitutional crisis, which had been on since the opening of summer, was still in suspense. All business interests were suffering therefrom. With this fact in mind, the following extract from another of John Lund's letters, this one dated October 5, offers another explanation of the anti-republican success:

Another consideration favorable to the monarchical solution of the difficulty is found in the fact that if we decide to take a King, our Parliament can settle the matter in accordance with the constitution just as the constitution stands; whereas, if we conclude to establish a republic, our constitution will have to be modified, after the voice of the people has been heard on the question.

Another cause is stated very frankly in this paragraph from another prominent Norwegian politician, who wrote as follows in December:

I am quite of your mind concerning monarchy and republic. But when vanity seized hold of many of our great men, like Björnson and others, it was next to impossible to check the movement toward monarchy.

And, finally, a press campaign in favor of monarchy in Norway spread all over Europe. News agencies, particularly Reuter, special correspondents and editorial writers in scores of newspaper offices, seemed to vie with one another in their advocacy of the calling of Prince Charles to the throne. I have already shown how the powerful French organ,

the *Temps*, changed front. The widely read London *Times* naturally led in the movement, and the European press generally followed suit for one reason or another. All this made a strong impression in Norway, which never before in its history, perhaps, had received so much attention from the outside world, and unquestionably influenced both leaders and rank and file.

Once convinced that the present and especially the future safety of Norway lay in the monarchy, the Government carried thru the measure with a high hand. On September 27 ten members of the Storting introduced a bill demanding that a constitutional convention be called. But the proposal was voted down. The minority then asked that the proposed *referendum* be taken as to whether the future form of government should be monarchical or republican. This, too, was negatived; and the people of Norway were forced to vote on the very narrow and offensive question as to whether the Government should invite Prince Charles of Denmark to be their king or not. That this action was high-handed is shown by the earlier opinions of members of the Government themselves. But first let me quote John Lund on the subject. Writing on October 11 that is, before this sort of *referendum* was decided upon, he says:

In spite of everything, there is a growing sentiment that the Government will take no further steps concerning a new King until the Norwegian people is asked, either thru a *referendum* or a fresh Parliament election, whether they wish to continue the monarchy or set up a republic. But it is difficult to say at this moment whether the Government will consult the people or if circumstances will oblige them to elect a new King, notwithstanding the fact that there are several republicans in the Government. My personal opinion is that the Government will not elect a King.

As late as September 27, Mr. Lövland, Norwegian Minister of Foreign Affairs, said to the Christiania correspondent of the Paris *Temps*, correcting the text of the conversation with his own hand, that the constitutional question would be reserved, and that the Government would keep its post till the general elections of 1907. During the interval the whole question would be thrashed out by the people, and then and not till then, would the Government act. He closed this important statement with these words:

"If the monarchical form of government is not maintained, we will choose between the three sorts of republics—the monarchical republic, as in France, where the President is a King for a fixed term; the Czarinian republic, as in the United States, where the President is an autocrat, and the republican republic, as in Switzerland. This last will please us the most, and this is the one we will doubtless adopt."

When the republican friends of Norway in France saw the unexpected turn events were taking, they decided to do what they could to come to the aid of the Norwegian republicans. Just before the *referendum* was taken, a group of Paris republicans sent an address to "the valiant republicans of Norway," which was signed by some fifty members of Parliament and by a goodly number of distinguished Frenchmen outside of Parliament. A mass-meeting at Paris was contemplated, but was abandoned because of the lack of time properly to organize it. Señor Salmeron, leader of the Spanish Republicans and ex-President of the ephemeral Spanish Republic of 1873, sent the following telegram, which was to have been read at this meeting:

"No people is truly sovereign master of its own destinies as long as royalty, however liberal it may be, retains supreme power. The republican party of Spain joins with you in expressing the hope that the noble Norwegian people will attain to that superior degree of political evolution demanded by the republic."

This telegram was immediately sent to the republican committee at Christiania for distribution among the republican newspapers.

In the meanwhile the *referendum* of November 12 and 13 occurred. The results were as follows:

|  |         |
|--|---------|
| Total number of registered voters..... | 439,742 |
| Did not vote .....                     | 108,512 |
| Rejected votes .....                   | 2,403   |
| For the monarchy .....                 | 259,563 |
| For the republic .....                 | 69,264  |

In answer to some strictures on the Norwegian republicans published by the Christiania correspondent of the London *Times*, I wrote as follows to that paper:

"The total number of votes cast for the republic, *quand même*, was close upon 70,000. There were over 100,000 electors who did not vote. It is fair to suppose that a quarter of this number, if not half, would have voted for the republic. It cannot be far from the truth therefore to say that at least 100,000 Norwegians were pronounced republicans at the moment of the *referendum*."

When I wrote the foregoing lines, I had not seen the Minister of Justice's official report to the Storting concerning the *referendum*. This document gives, in several places, still stronger proof of the ingrained democratic and republican character of the Norwegian people. In some fifty of the parishes there was a majority for the republic, and in several the vote was nearly evenly divided. What might have happened if all the republican leaders had remained faithful to their lifelong convictions is shown by the returns from the county of Bratsberg. This is the home of Mr. Gunnar Knudsen, whose firm position in this respect is mentioned above. The result of the voting was that twelve out of the twenty-five parishes went republican, and the total for the whole county stood, 6,636 anti-republican and 5,149 republican, the "banner" republican county of the *referendum*.

Could this perversion of the real sentiment of Norway have been prevented and a republic established there last autumn? I answer this question with an unequivocal Yes. To the general and particular proofs of this already given, I may add the following strong one—an extract from a letter of Mr. Knudsen, written on November 27 last:

I think there can be no doubt that a moral support from the two great republics, the United States of America and France, would have been of great importance. But, as a matter of fact, we got none. The United States of America was quite unwilling, and France, I suppose under the impression of the *entente cordiale* with England, left the question entirely in the hands of King Edward and Lord

Landsdowne, who undoubtedly did Norway some good service during the critical summer months. Of course this circumstance had some influence on the final result. That was natural.

If President Roosevelt could have seen his way to take the initiative, as mentioned in Mr. Knudsen's letter, with the French Government, and then both France and America had turned toward England for her co-operation—if these three countries had given Norway their moral support during the crisis of last summer, Norway would be a republic to-day. President Roosevelt would have found a ready response from the French Government. M. Rouvier, then Minister of Foreign Affairs, was spoken with three times on the subject. His objection to taking the initiative himself was fear of Germany getting control in Norway and his not wishing to offend Russia and England.

I may close this article with an extract from another letter of Mr. Knudsen, dated November 14—that is, the day after the result of the *referendum* was known:

As regards "the future of the republican party in Norway," I think there is very little to say about that for a very long time to come. The decision now given is final for most of us. I have publicly declared, and most of the republican papers agree with me, that the decision given by the people must be respected. Consequently no effort will be made to abolish the new monarchy. Practically all politicians in this country agree in giving, in the future, our attention to internal politics, trying to make our country as rich and the population as happy as possible. The future may bring about the United States of European monarchies or of European republics; nobody can tell which.

PARIS, FRANCE.

## Yesterday

BY ANNA BURNHAM BRYANT

You envy not my bitter bread?  
'Tis true 'tis bitter!—well-a-day!  
What matter, once the meal is sped?  
At least I feasted yesterday.

Oh, ay; the water brackish seems;  
It scarce can drive one's thirst away;  
I mind it not—I have my dreams;  
'Twas sweet—the wine of yesterday!

Yea, farms may fail, ships sink at sea,  
And golden riches fly away;  
I warrant none can take from me  
My yellow gold of yesterday!

PENAUQUID POINT, ME.

# Literature

## A Life of Pater

To Pater's ultimate significance—or perhaps it were better in this connection to say insignificance—to his subservience to discreet impressions, to the vagueness and confusion of his ideas, to his lack of moral purport, to his worship of appearance and apparition—Mr. Benson\* does not seem to be very much alive. In compensation, however, he has probably done something more than justice to the obverse of his author—to that refined and exquisite ephemeralism which marked him as well in the sophistication of a phrase as in that of a sentiment, to that marvelously delicate sensitiveness to the transitory loveliness of things and that conscientious effort of appreciation which had with him something of the force and activity of a principle. But on the whole, the effect produced by Mr. Benson's volume is of a man unequal, for some reason or other, to dealing with the accumulated materials of his subject. He is too much inclined to take them piecemeal, with an eye merely to texture, and without thought what sort of *ensemble* they may happen to make, while what glances he does give to the whole seem to us to mistake its character altogether. To speak, for instance, of "the intellectual trend of Pater's temperament," or of his life as that of "one who, thru a dreamful and unpraised boyhood, thru a silent and undistinguished youth, gradually discerned a principle in things"—to speak in this tone, tho the words may admit of probable interpretation in several senses, is at least to run the risk of giving a false impression of the man's literary character.

And this is the more unfortunate, because, outside of his writings, Pater's life apparently amounts to little or nothing. What did the world look like to Pater? That is what we should be glad to know—a jumble of tones, colors, forms, a checker of lights and shadows, a loose mesh of fugitive sensations and impressions, like the daubing of a painter's pa-

lette, a plaintive little air broken by distance and intermediate noises, a smoke dispersing and reforming on the breeze? His consistency seems mainly physiological, as of a man occupying the same lodgings from year to year, and spinning his visionary cobweb in pretty much the same sort of odd, out-of-the-way corners. At least, such is the general impression produced by Mr. Benson's sketch—a Fellow up a pair of stairs in Brasenose, musing and bemused, with the exception of a few vague wanderings about the Continent or a brief residence in London. A few hints there are of a kind of unhappy opposition engendered by his work and personality, particularly of a strain with Jowett. But for all this and in spite of the final chapter of "Personal Characteristics," the man escapes us. His existence seems as phenomenal as his writings; and the character itself remains to the last, as it probably was in reality, largely conjectural and illusory.

## The Latest Volumes of Hart's "American Nation"

THE last five volumes of American Nation series\* keep up the high standard of excellence maintained by the earlier volumes. At least three of the volumes are written by the most distinguished scholars now working in the field of American history. The period treated (1789-1836) is designated by the editor. Professor Hart, as "The Development of the Nation." A survey of the individual volumes will best show their value, for, as in most co-operative literary work, there is great unevenness in the merit of tion is not close or even evident in some cases.

The first volume—*The Federalist System* (1789-1801)—is written by J. S. Bassett, professor of history at

\* WALTER PATER. By A. C. Benson. English Men of Letters. New York: The Macmillan Co. 75c.

\* THE AMERICAN NATION: A History from Original Sources by Associated Scholars. Edited by Albert Bushnell Hart. Volume XI. THE FEDERALIST SYSTEM, by J. S. Bassett. Vol. XII. THE JEFFERSONIAN SYSTEM, by E. Channing. Vol. XIII. THE RISE OF AMERICAN NATIONALITY, by K. C. Babcock. Vol. XIV. THE RISE OF THE NEW WEST, by F. J. Turner. Vol. XV. JACKSONIAN DEMOCRACY, by William MacDonald. New York: Harper & Brothers. \$2.00 each.

Trinity College. In the main there is no marked originality in the treatment of his subject. The one exception is a successive volumes, and the co-ordinating chapter on "The First Victories of Anti-Slavery," which is doubtless the result of Professor Bassett's previous work on the subject of slavery in North Carolina. A map showing the progress of emancipation from 1777 to 1804 shows graphically one of the principal movements treated in the chapter. An interesting phase of the subject is the amount of anti-slavery feeling shown to have existed in Virginia and the South during this period, before the invention of the cotton-gin, and before Virginia slaves were in demand to stock the new plantations of the lower South. This chapter and two others on social and economic conditions are well arranged treatises on static conditions in this period, but the dramatic power shown in the more purely narrative parts of the book is very commonplace. The work is distinctly that of a scientific historian, more interested in stating exact truths than in getting literary excellence by dramatic marshaling of the facts.

The second volume—that on *The Jeffersonian System*, by Professor Channing, of Harvard—is a study in "imperial democracy." The author shows therein how it was possible for the nation to expand in territory and to develop an aggressive spirit without unsphering democracy. He shows, too, how the Federal Government gained in weight and authority, and at the same time grew more democratic. Professor Channing disappoints us by producing nothing original, attaining no scholarly depths yet unattained, but he is at least frank in telling us of his admiration of Henry Adams's great nine-volume work on this period, and acknowledging that it is the foundation of his own comparatively brief sketch. One of the marked differences in treatment is the history of the "Burr Conspiracy," in which Mr. Channing takes ground between the extreme positions of Henry Adams and Mr. McCaleb, whose recent exhaustive monograph on the subject gives a new interpretation to Burr's motives and purposes.

On the whole it seems to us that the

book is not in Professor Channing's best vein, tho it is quite good enough to be an object of pride were it the work of one of the lesser scholars in the American history field.

K. C. Babcock's book on the *Rise of American Nationality* (1811-1819) is well and vigorously written, without making any considerable contribution to the subject or giving any new interpretation. It is, however, a daring task to attempt to rival in their own field two such eminent scholars as Henry Adams and Captain Mahan. President Babcock has succeeded, however, in giving us a convenient and accurate handbook of the subject. He justifies the title of the volume in four chapters, which show the new national spirit evidenced in the foundation of a new national finance, and in the progress of internal improvements. The attitude of the Supreme Court to the rise of American nationality is set forth in an able chapter on the great constitutional decisions of Marshall.

The great volume of the series is that written by Professor F. J. Turner on *The Rise of the New West*. No more profound study of any period of American history has been written. It is the perfect fruit of long years of patient study by a man of unusual endowments. Except some eight or ten brilliant essays which have appeared in the *Atlantic* and elsewhere, Mr. Turner has written nothing heretofore. He has had the calm confidence in ultimate fruition which has in the past enabled a few scholars to toil thru long years, unrewarded by the applause which greets the written book, because they saw the more enduring fame, the more lasting results, of sound scholarship.

In this study of the "New West" (1819-1829) we find not a mere superficial study of politics and social activities, no mere statement that there was a financial crisis in 1819, with a lively description of the way men acted, or a compromise over the admission of Missouri in 1820, with the story of a few speeches in Congress, or a quarrel over internal improvements and the tariff a little later—these are not the main subject; but Mr. Turner studies rather the economic and social forces which led to such happenings, the great fundamental

interests, and the reasons for them, which led the several sections into controversy. The author first discusses the commercial and manufacturing interests of New England, and the series of revolutionary economic changes which transferred the industrial center of gravity from the harbors to the waterfalls. Agriculture is shown to have been a relatively declining interest, the farmers in the outlying rural districts selling their lands to their wealthier neighbors, and going West with money to invest in better lands. Side by side with this economic change was a social change—the overthrow of the power of the once dominant Congregational clergy by an alliance of Episcopalians and dissenters. Following this sketch of New England is a similar one of the Middle States, which are represented as a region of transitions between the East and the West and between the North and the South. New York and Pennsylvania were, Mr. Turner says, fundamentally national in physiography, composition and ideals—a fighting ground for political issues which found their leaders in the other sections. The economic struggle between New York and Pennsylvania is graphically drawn, and the triumph of New York shown to have been due to the construction of the Erie Canal, which gave New York city the Western trade. Nevertheless, Pennsylvania grew rich thru the development of her agriculture and her manufactures. Politically, the whole middle region, says Mr. Turner, was the most democratic section of the seaboard, but it was managed by the politicians under a system of political bargaining, in which Martin Van Buren was a merchant prince. No great statesman arose in this region comparable to Clay or Webster. The South is the third section to be portrayed in its social and economic characteristics. Here the effect upon slavery and politics of the westward spread of the cotton plant is seen. Never in history, writes Mr. Turner, was an economic force more influential upon the life of a people. As the production of cotton increased the price fell, and the seaboard South, feeling the competition of the virgin soils of the Southwest, saw in the protective tariff for the development of Northern manufactures the real

source of her distress. The greatest internecine struggle in the history of mankind might have been seen to rise as in a barometer. In 1816 the average price of cotton was nearly 30 cents, and South Carolina leaders favored the tariff; in 1820 it was 17 cents, and the South saw in the protective system a grievance; in 1824 it was 14 cents, and the leaders of South Carolina denounced the tariff as unconstitutional; in 1827 cotton had fallen to little more than 9 cents, and the Southern radicals threatened civil war.

Following this chapter are three powerful chapters upon the colonization of the West, its social and economic development, and its commerce and ideals. It is a sketch drawn just as the West was beginning to feel its power in national affairs, just before it became the dominant force in our political history. With the characteristics of the four great sections clearly before us, the author next takes up the great political problems of his period, and shows us how each section played the part it might have been expected to play, because of its economic interests or social peculiarities. In closing the review of this most profound and fascinating study, we should say a word about its literary qualities. While the style has the vitality and vigor which a strong personality and firm, scholarly confidence must give any written account, yet there is lacking a finish and a smoothness which a longer training in matters of literary form will surely give to a writer of Mr. Turner's pre-eminent abilities.

The last volume of the present series is that on *Jacksonian Democracy*, by Professor Macdonald, of Brown University. The period offers a magnificent opportunity, and in the matter of scholarship Mr. Macdonald has risen to the occasion. There is great accuracy in detail and marked sanity of judgment, the proportions of the subject are admirably maintained, and there is a truer estimate of Jackson's part in the history of his times than we have yet had; but there is a kind of levelness of treatment, no highs and no depths, no artistic finish, little sense for the dramatic interest, and, finally, no trace of originality in the conception of the subject. It is, however, the most scholarly book yet written on

the subject, and for college and university use will be invaluable.

### The Voice of the Street

SOME of us remember how, in Frank Norris's novel, "The Pit," the big Exchange building crouched like a huge monster in the dawn of that tale, something sinister, alive, threatening. Just so the Street creeps now adder-like thru Mr. Poole's story,\* down into the sallow depths, into the quickening silences of the great gambling hells, then back again, mad with joy and fear, "racing and straining," dropping its wreckage at Bellevue, at the morgue, into the river—the Voice of it always inarticulate, always eloquent, irresistible, shrieking its grimy, blood-stained notes into the song—the big, glad song which Jimmie could not make glad enough while the pain and passion of the Street was in his heart.

Jimmie is the hero; first a little pavement gambler, feeling the "luck big" within him, throwing dice upon the curbstone and winning. Next he is a young troubadour, still on the Street, singing impossible words to Faust's great love song—singing in a café for encores, roughing and killing the voice, while the old German and his daughter, Gretchen, fight against the sweatshop to save the voice. But above all is the roar of the Street, so imperative in its call to the "luck" in a young man starting like Jimmie, who had nothing but a chance to escape from its adder folds thru luck in the game.

And now the book begins to have a voice of its own. More than one writer since Norris has attempted to give tongue to the thing that has awakened, alive, trapped, maddened and full of pain, in modern life. To be sure it has always been there, suffering, and nearly always dumb, except now and then in history, when it has risen with a roar, written a great hymn like the "Marsellaise," achieved a revolution, then sunk back exhausted, glutted with the blood of an almost righteous vengeance, to go on starving and suffering. For the poor have never been able to deliver themselves. And as the poor they never will be. They are too

famished, too exhausted with the long struggle, too hedged about, fastened down. All they can do, or ever have done, is to make the effort and fall back. But when they lift up their voice there has always been a great furor. Nobody can interpret it; it is the foreign tongue to us of immeasurable woes. The novelists get incoherent, belittle it with mere muck-rake scandals in fiction. Hugo knew better, Norris felt it dimly in his large, epic way, and the author has caught the real strain of it more than once in this story of the Street "molding her children."

Here is Jimmie, with a voice in him like a good angel's, but born in the Street, subject to it, and hearing it call to the "luck" in him. With the rich gambling is simply a selfish vice, a pastime, a monstrous greed, or an effort to escape *ennui* with an imitation of desperate sensations, but for the child of the street it is the one golden chance against all the well-to-do world's odds. Vice becomes the heroic form of adventure, and thus the Street keeps master over the destiny of its children. They cannot work enough or save enough to win their way up out of it. The gambler's chance is the only one they have. More than one novelist recently has dwelt too long upon this impotence of the poor, and failed accordingly to offset it with any real compensation. Mr. Poole is near enough to being an artist to see the *whole* thing. He gets in the contrasts, the lights as well as the shadows. This is a new kind of "walking-delegate novelist," one who can make delicate distinctions, see veraciously. So the truth drawn in finest colorings in this story is this: Respectable, well-fed people do not know much about life from their own experience. For they have reduced it to a sort of formula, in which nothing stimulating, new or out of the ordinary can happen. They have made themselves cowardly safe from the vicissitudes of the common existence. But, down in the rush and roar of the Street, men are still in the middle ages of ragged knighthood. They are heroes, highwaymen, martyrs, figures fit still to be sung in the ballad. There is no safeguard anywhere. They fight with naked hands the brute forces above and below them. And a little Gretchen sewing-girl

\* THE VOICE OF THE STREET. By Ernest Poole. New York: A. S. Barnes & Co. \$1.50.

may rival Jean Valjean in self-sacrifice; all of which is better, more spiritual and more complimentary to human nature than being merely rich and respectable.

In short, the thing which pleases and satisfies the critical sense in this book is the approach it makes toward an interpretation and presentation of the life of the poor according to the modern conscience, while at the same time giving it the form and dignity of real literature. The author has not quite escaped the exclamatory phrase, but we must not forget that he is listening to the *Voice* of the Street, sometimes when "it was gay, throbbing, jerking, laughing, vibrating and thrilling with life," again when it lay gray and still in the dawn with sallow night faces floating in it, sometimes when it went insane with the big gamble of its children in their effort to escape. The Street is a character in this story, just as the mighty, quickening, seed-pregnant earth was a character in Norris's first "Epic of the Wheat." And when a mere man stands before such colossal characters to interpret them, his very incompetence expresses itself in exclamation points. But Mr. Poole has done much better than most writers who have made literary ventures in the sad, terrible under world of ragged knighthood.

**The Spoilers.** By Rex E. Beach. New York: Harper & Brothers. \$1.50.

Forty years ago, when the United States paid \$7,200,000 to Russia for Alaska, there were many who said we had wasted our money on a barren land of ice and snow, as valueless as the North Pole. It was something of a speculation, but it has proved a very profitable one. First, its furs and fisheries repaid its cost many times over. Later were disclosed its hidden hoards of gold, and now it is affording a rich literary harvest to such men as Jack London and Rex E. Beach. The latter is doubly lucky, for he got a million or so from his Alaskan mine and then wrote a successful novel about it. If he puts it on the stage, as it is reported he intends to do, he will have another gold mine. For the story is tremendously dramatic, quite unreal so no doubt, for some of the coincidences are too startling to be credible even for Alaska, but the artificiality of plot, or

rather the somewhat mechanical handling of the characters, does not impair the truthfulness of the picture of Alaskan life. The story is based on the career of Judge Arthur Noyes and his friend, Alexander Mackenzie, who were tried and convicted in San Francisco some three years ago. The miners, Dextry and Glenister, are true types if not real individuals. The women are purely fictitious. But the scenes of the dance hall and gambling room are unfortunately not overdrawn. There is a moral abandon about the atmosphere that affects the most upright and makes them in time indifferent or tolerant to evil. But the legal chicanery and robbery under the forms of law as Mr. Beach depicts them become so abhorrent that brutality and passion appear by contrast like primitive virtues.

**On Life After Death.** From the German of Gustav Theodor Fechner, by Dr. Hugo Wernecke. Chicago: The Open Court Publishing Co.

**The Little Book of Life After Death.** From the German of Gustav Theodor Fechner. Translated by Mary E. Wadsworth. Boston. Little, Brown & Co. (\$1.)

It is another indication of the present tendency of thought toward mysticism that two English versions of Fechner's essay on immortality should have appeared in the United States within the last eighteen months. *Das Büchlein vom Leben nach dem Tode* was first published in 1835, and it was thirty years before a second edition was needed. But the tide of materialism which he fought during his life has been receding rapidly since his death in 1887, and now the world is willing to give ear to the theories once deemed fantastic. Professor Fechner might almost be considered as an instance of double personality. He was the founder of modern experimental psychology, which the weak in faith used to denounce so bitterly as materialistic. He was the first to reduce psychical phenomena to a mathematic law, but at the same time he published under the pseudonym of Dr. Mises many humorous, paradoxical and mystical essays, some of which, like the present one, he afterward developed and expounded in a three volume work, entitled "Zend-Avesta." Fechner's peculiar theory is that there is

a soul of the world as well as of the individual and of the universe. Just as the babe comes into this life with organs fitted for it, so we are consciously and unconsciously preparing ourselves for the higher life in which we enter after death, a life which surrounds and pervades this life; and evil passions, forever at war, destroy one another, leaving only the good and the true as permanent and eternal. Fechner's belief in the interacting influence of different spheres of existence might easily be confounded with spiritism, but for the grossness of this he had a great repugnance. In comparing these two translations it will be noticed that Dr. Wernekke's is the more literal, but Miss Wadsworth's reads more smoothly. The former has the more extended exposition of Fechner's ideas in his appendices and quotations from his "Zend-Avesta"; the latter has a brief introduction by Prof. William James, of especial interest, since his own thought in recent years has shown a tendency to run in a line very similar to Fechner's in some respects.

### Literary Notes

BAEDEKER'S *Great Britain* (\$3) and *The Rhine* (\$2.10) are imported by Scribners in time for the summer tourist. No other guide books equal Baedeker's in completeness, compactness and accuracy.

....*The Green Room Book* (Warne, New York, \$1.50) for 1906, contains the dramatic news of London for the past year and brief biographies of all considerable actors, playwrights and managers, including many American.

....John Stuart Mill's argument against *The Subjection of Women* has unfortunately not yet become needless, and is reprinted in cheap form, with an introduction by Stanton Coit to serve as a weapon in the present conflict. (Longmans, Green & Co. New York: 40 cents).

....A good insight into the religious crisis in France and the cause of the great gulf still widening between the Clericals and the rest of the people may be obtained from M. Paul Sabatier's *A Propos de la Séparation des Eglises et de l'Etat*. (Paris: Librairie Fischbacher, 3 francs.)

....Edward Everett Hale shows all his old-time ability to get at the fundamentals of a subject and express them in the simplest language in the two addresses on the moral ideas underlying our civilization, published with the title of *The Foundations of the Republic*. (James Pott. New York: 75 cents.)

....Another volume of delightful "Birrellings" is published by Scribners under the title of *In the Name of the Boodleian* (\$1). Probably Mr. Augustine Birrell wishes now he were safe back among the books that he loves so well and knows how to make others love, instead of facing the storms of religious strife in his effort to get the education bill thru Parliament.

....To the handy little volumes containing lives of eminent Americans, published under the series title of "The Beacon Biographies," is added an interesting sketch of the life of John Fiske, by Thomas Sergeant Perry. In his remarkable precocity and the variety of the subjects to which he contributed valuable work Fiske, as he is here depicted, reminds one strikingly of Mill. (Small, Maynard & Co. Boston: 75 cents.)

### Pebbles

QUATRAIN IN THREE LINES.

FOUR lines are not needed,  
So, to give a simple clue,  
We will ask the summer question:

—N. Y. Sun.

THE baker is the happiest man ever. Everything he stirs up pans out well. All he kneads is his, he has dough to burn, and his stock is still rising. He certainly takes the cake! He's a stirring chap, and does things up brown. Tho he is well bred and somewhat of a high roller, he is not above mixing with his hands. Besides, he is pious, and cheerfully icing his favors for everybody. The baker is the original wise man of the yeast.—*Lippincott's Magazine*.

OF Marshall Field III. an amusing story was recently told at Lakewood. The boy, according to the story, approached an old lady in a Lakewood hotel and said to her:

"Can you crack nuts?"

"No, my dear; I can't," the old lady replied. "I lost all my teeth years ago."

"Then," said the little boy, extending two hands full of walnuts, "please hold these while I go and get some more."—*Denver Times*.

FATHER'S FORGOTTEN CLASSICS.

William had just returned from college to spend his spring vacation. One of the things most noticed by the young man was Fanny, the daughter of Si Perkins, a near neighbor, who had during his absence changed from a tomboyish schoolgirl into a very beautiful young woman. It seems his father had also noticed the change, and remarked to his son:

"William, have you noticed how old Si Perkins's daughter Fanny has shot up? Seems to me she's gettin' to be a jolly handsome young critter!"

"She certainly is, father," said William, enthusiastically. "Fanny is as beautiful as Hebe!"

"Where's your eyes, boy?" objected the father. "She's a durn sight purtier than he be! Old Si is as homely as Bill Jones's bull pup."—*Harper's Weekly*.

## The Great Awakening

WHEN the history of the opening decades of this twentieth century shall be written by some future generation; when the events in which we participate are viewed from a distance, and seen in their true proportions, the great unrest, of which everybody now is talking, will be more truly described as a great awakening. This term has more than once been used in history, but never with such meaning as it will have in the story of this present day.

It was a great awakening of the eastern Mediterranean world when, from the cruelty and sensualism of that Roman society which had submerged the glorious intellectual life of Greece, there emerged a new faith in spiritual things, and a new love of mankind which became a religion of hope to the millions who had known little but oppression and suffering. It was a great awakening when, after a thousand years of intellectual darkness, the light of learning kindled at Grecian altars again flamed forth upon the Western world. Again in those wonderful years that preceded the French Revolution, the stirring of the human mind was so swift and so profound that, conscious of its own quickening, it used this very term in its German equivalent—*aufklärung*—to describe the experience. Once more when, in this new world of America, the people, grown hard in their struggle with wilderness conditions, were spiritually dead, their greatest preacher and greatest intellect, Jonathan Edwards, described as "the Great Awakening" that intense emotional revival which swept all before it, and compelled men once more to think of other than material concerns.

Without exaggeration or irreverence we express the belief that a greater awakening than any one of these recorded of the past is now beginning. It is greater not only because it is vastly wider in its scope, involving millions more of human beings than ever were so stirred at any former time, but also because, as in no previous quickening of the human soul, it combines both the in-

tellectual and the moral factors of conscious life, and keeps close to practical issues. It is not the birth of a new religion, destined to harden into formalism and intolerance. It is not a mere revival of learning; and least of all is it a mere emotional upheaval. It is a vast grappling with great problems by the human understanding, and a profound conviction of the fundamental necessity of dealing with them in a spirit of righteousness, no less than with a clear intelligence.

By his new command over the forces of nature, and his perfected knowledge of the resources of the continents, man has created an astounding store of material wealth. He has not known how to distribute it justly or to consume it wisely. He has been swept from his old moral moorings by the excitement of his own unparalleled achievement. He has forgotten the things of the mind and of the soul. He has forgotten the claims of his fellowman. Like the gambler, he has become too absorbed in the game to ask whether it be worth while, or to take account of the misery that it creates.

But the revelation of greed, of dishonesty, of dishonor has begun, and the people are reacting upon it with a moral earnestness that gives impressive warning of impending change.

It is a reaction that is no mere outburst of indignation and that will be satisfied with no half-way measures. Not only in America, but thruout the civilized world, the people are discovering that dishonesty in business and corruption in politics are only incidental, and symptomatic of far deeper evils. And they are showing a disposition to work the problem thru, to grasp it in its totality, and to deal with it with a radical thoroughness such as has never before been seen.

Everywhere we hear the admission that the existing relations between the individual and the industrial system, between the industrial system and the State must undergo deep and positive reconstruction. To permit a relatively small class of clever, powerful, unscrupulous individuals to seize, control and exploit

for themselves alone the enormous wealth-creating resources and instrumentalities which new knowledge has put at the disposal of the human race, while millions of toilers obtain only the wherewithal of mere existence, is a fundamental and astounding injustice, which, when the people once clearly perceive it, will be denounced by the conscience and the common sense of mankind as intolerable.

This is the note that is being sounded on every occasion at this present moment. Every great public address for six months past, in one key or another, has struck it. Preachers from their pulpits, university presidents, and commencement orators, premiers and presidents, all have been moved to acknowledge this claim of elemental righteousness, as, in the days of the anti-slavery struggle, their fathers were moved to denounce the iniquity of the ownership of man by man.

And so this new great awakening, wider in its sweep than any other, greater than any other in its union of intellectual with moral forces, will be more effective than any other in its achievements. It will reconstruct human relations, reshaping policies and institutions. It will not only regenerate intellect and conscience; but in the great objective world it will establish society upon the broad foundations of fundamental and essential justice.

## Enforcing the Laws

IN Judge McPherson's court at Kansas City, a railroad company, four of the great beef companies, and two freight brokers were found guilty of violating the laws which forbid discrimination in freight rates. The Armour, Swift, Cudahy and Morris beef companies were fined \$15,000 each for receiving unlawful concessions, and the Burlington road's punishment for granting these concessions was a fine of the same amount; but the two brokers were sent to the penitentiary. They had procured unlawful rebates for certain shippers and had been paid by a commission.

These two men are the first to be punished by imprisonment for giving or receiving rebates. Why, it may be asked, were not the beef packers sent to jail?

Because they were indicted and tried under a law which provides no penalty but a fine. Thomas and Taggart were indicted and found guilty of conspiracy to violate the same statute. The prosecution of them for this offense was regarded by some as an experiment. Their conviction and their punishment by imprisonment probably clears the way for the similar punishment of much more prominent and powerful offenders.

"I suggest to you," said Attorney-General Moody in his letter to the District Attorneys, "that in all cases where the evidence warrants it, an indictment for conspiracy to commit an offense against the United States, based upon Section 5440 of the Revised Statutes, be obtained. The Supreme Court has held that a conspiracy to commit a crime, itself punishable only by fine, may be punished by imprisonment." Thomas and Taggart were the first to be tried on such an indictment, and they have been sent to prison.

A very interesting and an important discovery was made when it was proved that men guilty of procuring rebates could be punished by imprisonment, for the only punishment provided in the statutes which relate directly and specifically to rebating is a fine. Obviously, if Thomas and Taggart are guilty of conspiracy and can be sent to prison, the merchants who received the rebates and the railroad officers who granted them are equally guilty of the same offense and may be required to suffer similar punishment.

This, however, is only a narrow view of the possibilities of prosecution under Section 5440. It was immediately after these two obscure freight brokers had been sentenced that the Government's determination to prosecute the Standard Oil Company was announced. District Attorneys would be instructed, it was said, to procure indictments in the Standard Oil cases under Section 5440, if possible. It was asserted that the Government desired to place prominent and guilty officers in jail, in order that such punishment might restrain others. At about the same time it began to be reported that the Government intended to obtain the indictment of railroad officers of high rank, having in view in these

cases also the instructive effect of jail sentences. The possibilities of procedure under Section 5440 appear to have been considered in their relation to these projected prosecutions.

And so it may come about that corporation officers of high rank and great wealth, who would not be annoyed by a fine of a few thousand dollars, will find themselves in danger of confinement in some penitentiary. That should be their punishment, if their guilt be proved.

An examination of the prosecutions already undertaken or now projected shows that in some instances the offense alleged is unlawful discrimination; that in others it is a violation of the law forbidding monopolistic combination, and that in a few cases both of these offenses will be charged. Evidence in the Garfield report (it is said that the Government has much more of the same kind) appears to warrant the indictment of the Standard Oil Company and some of its officers for receiving rebates, and of several great railroad companies for giving them. But it may be that both the givers and the receivers will be charged with conspiracy. The pending indictments against the New York Central, the Sugar Refining Company and certain merchants, are for giving or receiving rebates, but the evidence indicates a conspiracy to violate the law in order that certain ends might be attained.

Combinations made in violation of law for the extortion of high prices by agreement are conspiracies. The two corporations indicted on account of their operations in the tobacco trade are to be prosecuted, however, not for conspiracy, but for combining to establish and maintain a monopoly. The greatest combinations recently mentioned as possible or even probable objects of attack by the Government are (if we except the Standard Oil Company, which may or may not be prosecuted under the Anti-Trust law) those of certain groups of naturally competing railways in the anthracite and the Eastern bituminous coal districts.

It has been shown during the Commission's investigation how the bituminous coal roads are bound together by community of ownership, and it is expected by many that this combination will be prosecuted under the Anti-Trust

law. This statute was not aimed at railroads. It was used to compel a dissolution of the Northern Securities combination, owing to complaints against the association of the two great parallel lines in the Northwest. But we do not understand that the business of those two roads is now marked by strenuous competition. Community of interest still exists there. If the combination of roads engaged in the Eastern bituminous coal trade should be disintegrated by prosecution, the results might be less satisfactory and beneficial to the public than the effect of such supervision and control of the roads in their present alliance as will be exercised by the Commission under the new Rate bill. In many cases of combination it is better to regulate than to tear apart or dissolve.

But prosecution for combining is one thing and prosecution for discrimination is another. It is mainly for receiving unlawful concessions in freight rates that the Standard Oil Company is to be brought into court, and it is for granting such concessions that railway companies and officers are to be made defendants. For every such violation of law there should be sure and severe punishment, not by fine alone, but by penitentiary or jail for the responsible officer, whoever he may be. We hope that the statute under which Thomas and Taggart were convicted can be used against other men more prominent but not less guilty.

## The Way Cleared for the Canal

At last the long and disheartening delay is over, and work in Panama can be begun in earnest. After two years of preparation and hesitancy we have decided what kind of a canal we want, and the men and machines are there ready to give it to us. The question that the best engineers of the world have discussed for the last thirty years without being able to come to a conclusion has been settled in a few months by a body containing no engineers at all. The reasons for the decision made by Congress are given by Senator Dryden on page 1513.

This not a time to inquire whether it was settled right. The alluring vision of the Strait of Panama has vanished into the dim and distant future. What we

have to consider are the practical advantages and difficulties of the project now adopted.

Foremost among these advantages is the fact that those who have the work to do have had their own way. President Roosevelt, Secretary Taft, the Canal Commission with the exception of one member, and Chief Engineer Stevens have enthusiastically and persistently championed the plan for the lock canal, and upon them now rests the entire responsibility for its execution. If Congress had forced upon them the task of constructing a sea-level canal after they had expressly declared their lack of confidence in that plan, there would have been excuse for throwing upon Congress the blame for such new difficulties and expenses as appeared during the progress of the work. But Secretary Taft has definitely promised that the canal will be completed and in operation in eight years. Therefore Uncle Sam has marked upon his desk calendar for July 1, 1914, this memorandum: "See if Panama Canal is in running order. If not, ask Taft why not."

The center of gravity of the canal is now shifted from Culebra to Gatun. The Culebra Cut is no longer a formidable undertaking. It now means the excavation of about five miles to the depth of about 100 feet, a work of no especial difficulty or uncertainty, but at Gatun is to be constructed an earth dam, a mile and a half long, a half-mile thick at the base and 135 feet high, and thru this a double flight of three locks, each 900 feet long. Both these projects are quite unprecedented in the history of engineering, and their construction will be the crucial point in the canal work, both in time and expense. We asked the advice of foreign engineers on this point, and they all agreed that it was inadvisable and unsafe. Thereupon we did what people generally do when they ask advice of others, we rejected it, and said we would do as we pleased. Now the American engineers who have devised the plan will have a chance to prove that they are right and the rest of the world wrong.

The Gatun project certainly has a daringness of conception that appeals to the imagination. As one walks up the long

hill behind the railroad station, where an American now has a cattle ranch, and looks twenty miles up the valley of the Chagres River to the hills from which it emerges, it is startling to think that in a few years the largest ships may be ascending that same hill and sailing far above the tops of the trees beyond. The scenic railroads thru the mountains will have no grander view than that which this scenic sea voyage will offer to the passengers on the upper deck of an ocean liner as she slowly and majestically descends the great staircase to the Atlantic, eighty-five feet below. Lake Gatun, not yet in existence, but which we hope will be upon the maps of 1914, will open up to ocean commerce a large inland region where ships from the Pacific and Atlantic can load with cocoanuts, bananas and coffee, not to mention the numerous remoter possibilities of Isthmian agriculture.

The construction of the locks will require some 3,750,000 cubic yards of concrete, a greater amount than has ever been made for a single purpose. It becomes then a serious question where the immense amount of Portland cement needed for this is to come from. By the action of Congress all supplies for the canal are to be bought in the United States unless the prices charged are unreasonable and excessive. But if the Government is to construct these locks directly, it would be much the best plan for the Government to make its own cement. The process of manufacture is not difficult, the materials can be found in many parts of the country, and no trade secrets and unobtainable machinery are necessary. The quality of the cement used would in any case have to be regulated by Government experts. In fact, the best methods of chemical analysis and testing of the strength of cement are those devised by our official scientists at Washington. The plant would not be useless after the canal was finished, for the Government constantly has to buy large quantities of cement for irrigation works, docks and buildings, and the supply is not equal to the demand. The construction of the Manchester Ship Canal was not an advantage to the manufacturers of Portland cement in England as was expected, for it used so large a pro-

portion of the product that the Germans and Americans got ahead of them and they have not yet been able to regain their former export trade.

It will be the policy of the Canal Commission to call for bids for doing the work by contract, and if these are found reasonable much of it will probably be assigned to contractors. The difficulty with the contract plan in this case is that the work cannot be divided into small jobs, because contractors of moderate capacity cannot afford to undertake work at such a distance and under such difficulties. Besides, the work on the whole canal is closely correlated. For example, the dam at Gatun is to be made from the clay dug from Culebra Cut and the dredgings from Limon Bay, which, therefore, must be delivered directly on the spot as needed for the dam.

It is to be hoped that the question of what parts of the work are to be done directly and what by contract will be decided promptly by the Commission, because this is all that now stands in the way of the beginning of efficient work. We have now 27,000 men at work on the Zone, more than the French ever had. The force is organized in all departments, the questions of sanitation and housing and feeding are practically settled, much of the needed machinery is on hand, and on July 1st an appropriation of \$26,300,000 will be ready to be expended during the year. In November President Roosevelt will visit Panama to cheer the boys up and see how things are going. If the Canal Zone is not yet American it will be by that time, for by our unwritten law wherever the President sets his foot that soil belongs to the United States.

## The Causes of the California Earthquake

WE hear much of the energy and promptness of the people of California nowadays, but nothing illustrates the spirit that prevails there more strikingly than the publication of the preliminary report of the State Earthquake Investigation Commission. Ordinarily such scientific studies, and especially when issued as public documents, do not appear until some five years after the pop-

ular interest in their subject has died down. But in California even scholars have to hurry. Within three days after the great earthquake of April 18 the Governor had appointed a commission of nine scientific men, mostly from the State and Stanford Universities, to investigate its extent and causes, and within a month and a half we have a well considered and clearly written report containing the main facts, a discussion of their significance, and some advice on rebuilding.

The Commission finds that the earthquake was due to a slipping of the earth's crust along an ancient fault, resulting from successive dislocations dating from the quaternary period. They are able to trace the rift from Point Arena, on the coast in Mendocino County, to Mount Pinos, in Ventura County, a distance of 375 miles in a southeasterly direction, along which there is a well-defined cracking of the ground. The line of this rift is nearly straight and runs into the ocean below Fort Ross, entering the shore again 8 miles south of the Cliff House, thus passing outside of Golden Gate. Along this rift the ground shifted both horizontally and vertically. The southwest side of the rift moved about 10 feet to the northwest, and was raised about 4 feet as compared with the land on the other side of the rift, altho which side moved or whether they both moved cannot yet be determined. "As a consequence of this movement it is probable that the latitudes and longitudes of all points in the Coast Ranges have been permanently changed a few feet." This can be determined by repeating the triangulation work of the Coast and Geodetic Survey from the old stations.

The greatest violence of the earthquake was along the rift, but the area of destruction extends for some 25 miles on each side. All fences, roads, bridges and pipe lines crossing the rift were dislocated. In one case the two ends of a broken road have slipped past each other 20 feet. Trees were uprooted or split, buildings were thrown down and fissures opened in the earth. Some of them closed again, and in one a cow was engulfed.

The earth waves that passed thru the

rocks were swift and short, but when they reached the valleys filled with alluvial deposits the waves became slower and longer, and consequently much more destructive. The artificially filled land in San Francisco was shaken like jelly in a bowl, and here the greatest damage took place. Buildings founded upon solid rock, especially if constructed of steel or well braced, suffered little. The most severely shaken town in the State was Santa Rosa, next follow in order Healdsburg, San José, Agnews and Stanford University.

The earthquake began at five o'clock, twelve minutes and six seconds a. m., according to the record of the seismograph in the observatory of the State University at Berkeley. The shock lasted one minute and five seconds, and was followed by twelve minor shocks within an hour, due to the settling of the disturbed portion of the earth's crust. The shock was recorded at the seismographic stations of Washington, D. C., Sitka, Alaska, Potsdam, Germany, and Tokyo, Japan. The study of these records will give valuable information about the way the vibrations were propagated, both around and thru the earth, and may throw some light upon the constitution of the interior of the earth.

### Early Colleges for Women

IN a biographical article on Susan B. Anthony, in *THE INDEPENDENT* of March 22d, Mrs. Ida Husted Harper made the following statement about the educational condition of women in Massachusetts and New York when Miss Anthony was a girl in the thirties and forties:

"Not a high school was open to them, while a college education was hardly dreamed of."

This is quoted by a writer in the *Montgomery, Ala., Advertiser* of May 25, who shows that from 1817 to 1847 Mississippi, Alabama, Georgia and even Texas possessed incorporated colleges for women measurably matching their colleges for men, and that they graduated classes of cultivated women.

We do not doubt it; but we know also that in New York and New England there were not a few similar schools, only they were called academies or seminaries. Among the famous ones were those at Troy, N. Y., and Ipswich, Norton and

South Hadley, Mass. Besides these there soon were co-educational academies too numerous to mention. Mrs. Harper says that no high schools were open to women. That is technically true, because there were almost no "high schools" then, that is, free high schools supported by the town, either for boys or girls. When they came they starved out all but a few endowed academies. These academies corresponded to the Southern "colleges," which latter term is still thus applied in those States. The admission of women to the real college followed the establishment of Oberlin in 1833.

It was in 1789 that Isabella Graham came from Scotland and opened a young ladies' school. She died in 1814. It was this year that the Albany, N. Y., Academy for Women was started, tho not incorporated until 1821, and still continues. The academies were not co-educational at first. It was not till 1829 that South Berwick, Me., Academy, admitted girls. Miss Catherine Fiske began her similar work in Keene, N. H., in 1815. Mrs. Emma Willard opened her famous Troy Seminary in 1821, and Miss Catherine Beecher hers in Hartford in 1822. Rev. Joseph Emerson's school to fit women as teachers opened in 1818, while the first normal State school in the country was established in Lexington, Mass., in 1839. Miss Grant began her academy for girls in Derry, N. H., graduating a class with diplomas in 1821, and when the trustees complained because she would not teach dancing, she removed to Ipswich, Mass., where her school was carried on, with Mary Lyon as assistant, who later opened Mount Holyoke Seminary. The teaching was of a high order, including Latin, sciences and political economy. In 1835, seven years from her opening of her Ipswich school, 13 missionaries of the American Board, 53 teachers in the West and South, and 300 teachers in New England, New York and New Jersey, had gone from under Miss Grant's instruction.

It is true, as Mrs. Harper says, that in Miss Anthony's girlhood she could not have been admitted to any college in the United States, unless she had gone to Oberlin. But excellent seminaries for women and excellent coeducational academies were scattered by the score over New England and New York.

## Urban and Rural Mortality

A SPECIAL report on the statistics of mortality in this country for the five years, 1900-1904 inclusive, has just been published by the Bureau of the United States Census, and contains some interesting features. Probably the most striking fact brought out is that the difference in mortality between city and country is gradually becoming less. Indeed, in one State, Rhode Island, the death rate was as high in the rural districts as in the cities. Even in such thickly populated States as Massachusetts and Connecticut the urban death rate exceeded the rural by less than one per thousand of population. In other States where the thickly crowded large cities occur this favorable condition as to urban life was not so marked, but there has been a very decided improvement in mortality in favor of the cities in recent years. In fact, as is pointed out even at the present time, the mortality statistics are not quite fair as regards the large cities, particularly since, as is well known, many of the ailing from country places, when they become incurably ill, find their way to the city, either for hospital or dispensary treatment, because they hope to be benefited, and thus constitute additions to the city death rate while reducing that of the country places.

These statistics could not come at a more opportune time than now, when for health's sake so many are exchanging city for country. Considering the usually accepted notion that the country is ever so much healthier than the city they can scarcely fail to prove a source of surprise to many persons who have not realized present-day medical advance. The enforcement of sanitary regulations in city life has done much to lower the death rate, especially during the last twenty-five years, and the consequence is a marked improvement in living conditions. Perhaps the amelioration of hygienic conditions in the large city is best reflected in the reduction of the mortality from tuberculosis. The average annual mortality during the last five years has been about 172 per 100,000 of population. At the time of the preceding census, in 1890, the tuberculosis mortality rate was 245 per 100,000. Over

seventy victims per 100,000, nearly one in every three are now saved. There are other reductions in mortality that are worth while noting. Typhoid fever, for instance, has become much less serious a factor in urban mortality than it used to be. While it is not generally realized, typhoid fever is a rural rather than an urban disease, and the death rate was higher in the country always until last year, when for the first time the country typhoid mortality was more favorable than that of the cities of more than 8,000.

The most serious sources of fatal illness in the cities are those affections which are due to the inhalation of noxious materials from the air. The two "great captains of the men of death," as Professor Osler calls them, are consumption and pneumonia, and pneumonia is now pushing its colleague very closely in the race for the leadership. Unfortunately while the mortality from tuberculosis is being slowly but surely reduced, the mortality from pneumonia is as constantly increasing. It is evident that until more care is taken in large cities to prevent the contamination of the air that must be breathed by the inhabitants, these respiratory affections will continue to be veritable scourges for urban population. The dust of city streets must be laid by frequent watering and constant removal. The dust in houses must not be lifted into the air by sweeping and dusting to become the source of at least respiratory irritation, if not actual disease, when breathed, but must be removed by various vacuum processes. The crowding of means of transportation which compels the inhalation of the breath of other people must be prevented. Not until these measures can be made effective can we look with any confidence for the further reduction in the death rate from the respiratory diseases. Here lies the line of advance that must be insisted on.

In the matter of deaths from enteric diseases in adults the city is much better than the country. Many a New Yorker leaves the city hoping to find health and strength in the country, only to suffer from diarrhoeal diseases as the result of improper food and unripe fruit and vegetables, or to acquire the typhoid fever which lurks in the drinking water of so many rural districts, especially when

overcrowded, because of the presence of large numbers of city visitors, or in the raw vegetables which become contaminated from the water. The city death rate from typhoid fever is always notably higher during the months of September and October, and most of the increase is attributed to the fact that summer sojourners in the country bring the disease back with them, sometimes to communicate it to relatives before it dies out. This represents the one serious danger that must be guarded against by city dwellers in the country. As a rule it would be better to stay at home in the city than go to the country if there cannot be a guarantee against the ever-menacing typhoid risk. The warning is plain for those who desire summer boarders. They must, above all, guard water supplies from any possible chance of contamination.

**Prosecutions in Philadelphia** An impression has prevailed in this country and abroad that large frauds were unearthed in Philadelphia about a year ago by Mayor Weaver and other honest citizens. Everybody understood that a Boss and a Ring were found and exposed. Names were used with great freedom, and there were estimates, official and unofficial, of the value of each ringster's plunder. Apparently, certain persons deserved to be punished. But time has rolled on, and no one has been prosecuted to conviction. Last week the third trial came to nothing. The defendants were a former Director of Public Safety and several other persons accused of defrauding the city in connection with the erection of a hospital. For want of evidence the case was taken from the jury and the defendants were acquitted. This third failure directs attention to the prosecutor, District-Attorney Bell. The results of his efforts are enumerated by the *Record* as follows:

"(1.) Prosecution of former Filtration Engineer Hill—Case taken from the jury. Defendant acquitted.

"(2.) Prosecution of Select Councilman Caven—Defendant acquitted.

"(3.) Prosecution of Abraham L. English, *et al.*, accused of conspiring to defraud the city in connection with Municipal Hospital contracts—Case taken from the jury. Defendant acquitted."

By the following remarks the *North American* attempts to define his attitude:

"Mr. Bell was put into office by the old Gang which so long misruled the city. These politicians are his friends; their kind of politics is his kind; his sympathies have always been and are now, with them; he has long been counsel for the contracting ring; his heart has never been with the reform movement, but he has given more than one demonstration of the fact that the old ways and the old crowd are those that he prefers."

Mr. Bell's affiliations and inclinations and engagements as counsel have been known to the people of Philadelphia for about one year. We do not hear that they have protested against his control and management of the ring cases. If the Mayor and other reform leaders had appealed to the Governor they might have obtained a special prosecutor for all cases of this class. Having accepted Mr. Bell as a prosecutor they must now accept the results of his labor.

**Suicide** Suicide implies, generally, either insanity or a lack of faith in the future life. When life becomes unbearable those who think that death ends all, and that no dreams are in that sleep, may lose hope here, and have no fear of the hereafter. There has been such an epidemic of suicide in Japan, five youths in succession hurling themselves over the Kegan waterfall, followed by another young man of distinguished family, who threw himself into the Aso volcano. He left a farewell letter which ends:

"How miserable is this world of human beings! Grief and care invade their bosoms; pain and affliction encompass their existence. Where is hope to be found; where may peace be sought? What is glory, what is rank? All around is emptiness and solitude. Wealth avails nothing, and nothing is comprehensible or credible. Society is but a battlefield of sorrow and suffering, and throughout life men are as hungry demons fed on torturing scepticism. Alas for the infinity of it all! . . . All are plunged in darkness and know not what to look for. Mercy and benevolence are as the fleeting sentiments of a dream. Why should man torment himself with limitlessly painful thoughts; why should he wander in the paths of contaminating sin? Is it not the most blessed ending of human life to be received into the bosom of pure nature and forever to quit the dust of existence? Thinking these things I pass into the smoke of Aso's crater."

The boy may have lost his mental balance; but he had been studying philosophy under Dr. Inouye Yenryo, and had graduated with distinction. But the philosophy he had learned is that of hopeless despair, the natural end of which is suicide.

**Convict Hire in Georgia** The country knows, with shame, that the system of convict hire and convict camps continues in Georgia and some other Southern States. It is profitable to the lessees, and a horrible outrage, allowing all sorts of cruelty to the prisoners. But it provides an income to the State, and therein it leads to the conviction of as many petty offenders as possible, that the State may be saved taxes and the favored contractors may be benefited. We see the report from the last quarter, by which, for three months, \$83,932.14 is due the State treasury, or about \$320,000 a year. And there are thirteen contractors that bid for the labor of these men and women. The favored one is the firm of Hamby & Toomer, Atlanta. But those names are mere blinds, clerks or some such people, put up into this position thru the influence of the real lessees, those men who reap the large profits and are ashamed of their business. The convicts detained under that lease are known to be employed by the Chattahoochee Brick Company, formed and controlled by James W. English, ex-Mayor of Atlanta and director of the Central Railroad of Georgia, which is owned and controlled chiefly by a very distinguished New York banker. We observe that one candidate for Governor of Georgia suffers from the charge that he is interested in this nefarious business. The other lessees mostly hide their names under corporations—coal, lumber and brick companies—eight of them. It is hopeful that public opinion begins to make the business disreputable, just as in slavery days slave-drivers and slave-dealers were somewhat under the ban.

**Chautauqua Abroad** The German academic world has in recent years adopted an earlier American institution, and has been enriched by a new term, that of *Ferienkurse*, or vacation

lectures, which are announced again in large numbers for the coming summer vacation. The chief purpose of these courses, held under private and not university auspices by university men, is to offer to non-academic persons, male and female, the results, in popular form, of the best results of research and investigation. The leading summer schools of this kind are to be held in Jena, Koenigsberg, Bonn, Berlin, Salzberg and elsewhere. The attendance at some of these schools runs into the hundreds. The most unique series is that at Salzberg, the seat of the proposed "free" Catholic university, which is to be entirely "independent" of modern "unchurchly" learning. Here, for the fourth or fifth time, full courses of lectures, illustrative of the best scholarship of the world, are to be delivered in September by a corps of eighteen professors from the leading universities of Germany and Austria. The chief schools for the woman contingent is Jena, where also a large school will be opened during the summer.

Senator Dubois, of Idaho, said in the Senate:

"It is impossible now for any man to be elected to either house of Congress from the State of Wyoming, Utah or Idaho unless he yields to the dictation of the Mormon hierarchy."

Doubtless what he says is true of Utah, and the Senator ought to know how it is in Idaho, but our information does not make it true of Wyoming. There the few thousand Mormons, out of a hundred thousand population, do not seem to exert more than their fair proportion of influence. It is true that they are welcomed as citizens, for they come as colonies, with men of various crafts, mostly farmers, and they understand irrigation, on which Idaho agriculture will depend. The State does not allow polygamy, altho sporadic cases are said to occur.

The fight in Great Britain over the Government's Education bill has given occasion to some blows below the belt. One of the opponents made it a point against Dr. Clifford, one of the most prominent Nonconformist ministers,

that his title of D.D. came from a worthless American college; and this has caused a discussion of American degrees. As it happens Bates College, from which Dr. Clifford received his degree, is a thoroughly reputable college in Maine. It has, in its college department, a president, nine professors and as many instructors, and librarian, and the college has 350 students. Connected with the institution is the Cobb Divinity School with six other professors. Dr. Clifford need not throw overboard his semi-lunar fardels because of any unflattering description of the institution in a vicious article. We know less of "Temple College, Penn.," which inflicted the degree on the Rev. Mr. Aked, of Liverpool, which he repudiated. He does not even wish to be called *Reverend*, and we beg his pardon.

King Leopold tells us that, as the result of the report of the commission sent to the Kongo Free State, he will make some reforms and will open certain portions to the trade of other nations. That is likely to be the portions where the profit in rubber has fallen off with the death or escape of the people. It is instructive to observe the contrast between the policy of Leopold in the Kongo and that of England in the Sudan. The one takes all the land as Crown property, robbing the natives; the other is concerned that the native remain in possession, and gives him title to his land and protects him in every way. One policy kills off the people; the other fills the land with a contented population.

Provisions required by Congress to be put in a State constitution as a condition of admission to the Union may have no binding authority, as a sovereign State, once admitted, has the right to change its constitution as soon as it pleases. But a State would not do it, as we have seen in the case of Utah, admitted on condition of its constitution forbidding polygamy. So we are glad that the constitutional provision is imposed on the new State of Oklahoma that the liquor traffic shall be prohibited on the Indian lands for twenty-one years,

and we presume it will stand. Whether it will be enforced is another thing.

Our merchants on the Pacific Coast are now learning the shortsightedness of the policy which has excluded and insulted the Chinese. It has now come time to receive orders for export to China, and they discover that the boycott has so reduced their business that only one-half or one-quarter as much goods are called for. This recalls the warning of Senator Hoar, who was the chief opponent in Congress of our policy of exclusion, and who declared in the Senate:

"As surely as the path on which our fathers entered one hundred years ago led to safety, to strength, to glory, so surely will the path on which we now propose to enter bring us to shame, to weakness and to peril."

Now that the support from the State is being withdrawn from the French churches, they have to plan for income. The Archbishop of Bourges has fixed the tariff for masses after the following scale: For low masses at any free hour, 30 cents; low mass at day or hour, 40 cents; low mass on an endowment, 60 cents, of which 40 goes to the celebrant, 5 to the clerk and 15 to the church; a chanted mass on an endowment, \$1, of which 70 cents goes to the priest, 15 to the chanter, 5 to the clerk and 15 to the church. We see no reason to kick at those prices, and it is pleasant to see religion made so reasonable or cheap.

This is the record of the conviction of John Kean, the Philadelphia kidnapper: At 10.10 a. m. he was arraigned before the magistrate; at 10.25 committed without bail; at 11.10 the grand jury found a true bill; at 11.20 brought to the court room; at 12 pleaded guilty; at 12.30 sentenced to twenty years in prison. That is the kind of swift law which will put a stop to lynching. But if he had not pleaded guilty, and had had as much money as the murderer Patrick to fight the sentence, we should have to tell a very different story. Our criminal law is in a very sad way. It helps the criminal if he has money.

## The International Policy-Holders' Committee

THE work done by Samuel Untermyer in connection with the International Policy-holders' Committee has begun to bear fruit, and the makeup of that committee, with the exception of the French and English representation, was announced this week. The committee, as at present constituted, contains the following members:

- Gov. Napoleon B. Broward, of Florida.
- Gov. Newton C. Blanchard, of Louisiana.
- The Rev. Dr. Russell H. Conwell, founder of the Baptist Temple in Philadelphia and a leading clergyman of that denomination.
- Edgar E. Clark, of Iowa, president of the Order of Railway Conductors.
- Cardinal Gibbons, head of the Roman Catholic Church in this country.
- Judge George Gray, of Delaware, a member of the 1898 Paris Peace Commission and chairman of the Anthracite Coal Commission in 1902.
- Gov. J. Frank Hanly, of Indiana.
- John C. Hemphill, editor of the Charleston (S. C.) *News and Courier*.
- Harlow N. Higginbotham, ex-president of the World's Columbian Exposition and a partner of the late Marshall Field, of Chicago.
- Gov. John A. Johnson, of Minnesota.
- The Hon. Z. A. Lash, King's Counsel in the Dominion of Canada.
- Nicholas Longworth, Representative in Congress from Ohio.
- Frederick B. Niedringhaus, an iron manufacturer of St. Louis.
- Samuel Newhouse, a mine owner of Utah.
- Fremont Older, editor of the San Francisco *Bulletin*.
- Richard Olney, of Massachusetts, ex-Secretary of State.
- Gov. Samuel W. Pennypacker, of Pennsylvania.
- Judge Alton B. Parker, of New York.
- Gov. Henry Roberts, of Connecticut.
- Col. A. M. Shook, a capitalist of Nashville, Tenn.
- Charles Emory Smith, of Philadelphia, Postmaster General in President McKinley's first administration.
- Gen. Benjamin F. Tracy, of New York.
- Thomas B. Wanamaker, of Philadelphia.
- Henrich Wiegand, head of the North German Lloyd Company, designated by the policy-holders' committee in Germany as its representative in the international organization.

These men will support the campaign to be waged from now until December, the object of which is to place the two great mutual insurance companies, the New York Mutual and the New York Life, under the actual control of their

1,300,000 odd policy-holders in various parts of the world and to provide for them an organization that will render such control continuous and effective. The representatives of the English and French policy-holders will be named in a few days.

JAMES H. BREWSTER, the manager of the Scottish Union and National Insurance Company, whose headquarters in the United States are in Hartford, Conn., reports that the net losses of his company owing to the San Francisco fire will not exceed \$1,300,000. As the United States branch's net surplus fund is \$3,338,057.82 and the total assets \$5,379,583.06, the unquestioned solvency and stability of the Scottish Union should attract much new business to that company.

THE State Life Insurance Company of Indianapolis, thru its Colorado agent, the Life Underwriters Agency Company of Denver, Colo., has brought suit for \$100,000 damages against the New York Life Insurance Company because of a circular issued to the agents of the defendant company. It is alleged that a false and damaging impression was given currency by the circular in question.

### .....Dividends announced:

- Hall Signal Co. (Quarterly), 1½%, payable July 2d.
- Amer. Telephone and Tel. Co., \$1.50 and extra 75c. per share, payable July 16th.
- Amer. Telephone and Tel. Co. (Collateral Trust Bonds), Coupons, payable July 1st.
- Bowling Green Trust Co., 10%, payable July 15th.
- Amer. Woolen Co. (Preferred), 1¾%, payable July 16th.
- Buffalo, Roch. & Pittsburg R'way (Allegheny & West. Div.), 3%, payable July 2d.
- Westinghouse Elect. & Mfg. Co. (Preferred), 2½%, payable July 10th.
- First Nat'l Bank, Morristown, N. J., 5% and extra 2%, payable July 2d.
- Fisk & Robinson, Various Coupons (see advt.), payable July 2d.
- Buff. & Susq. R. R. (Quarterly), 1¼%, payable July 2d.
- Fulton Trust Co. (semi-annual), 5%, payable July 2d.
- Nipissing Mines Co. (Quarterly), 3%, payable July 20th.

## Gov. Guild and the Trolleys

When the Massachusetts Legislature, on the 23d, was preparing for final adjournment, it received a special message from Governor Guild, who wants legislation that will prevent the New York, New Haven and Hartford Railroad Company from obtaining control of all the Massachusetts trolley lines that are worth having. While the leading Massachusetts steam railroad corporation (the Boston and Maine) is forbidden by law to buy or otherwise control trolley companies, the New Haven company (a foreign corporation) has been buying them, and now owns a majority of those doing business west of Worcester. A bill giving the Boston and Maine the same liberty was defeated a few days ago, and the Legislature was about to end its session when Governor Guild interposed with his message, in which, after expressing his disapproval of this defeated bill, he said:

"The present railroad situation, however, is most unjust and inequitable. One steam railroad system is forbidden to meet the competition of electric street car lines by purchase or control of their stock, but another, controlled by men who are not citizens of Massachusetts, is not only permitted to exercise that privilege, but is exercising it today to such an extent that healthy competition in Western Massachusetts is already throttled. Slowly, surely the control of our own railroads, the control of the passage to market of every product, the control of the transportation to and from his work of every Massachusetts citizen, is passing from our hands to those of aliens. I, therefore, urge upon you, with all the strength that is in me, the passage of some legislation giving relief from this grave injustice. Let Massachusetts announce that transportation within her borders is in the future to be controlled by the people of Massachusetts and not by men beyond the reach of her laws and the inspiration of her ideals."

And so the Legislature postponed final adjournment and took up again this railroad question, considering a bill suggested by the Attorney General, and approved by the Governor, providing that if a foreign corporation (the New Haven company, for example) acquires, owns or controls, directly or indirectly, capital stock or bonds of a domestic street railway company, unless authorized by State law so to do, the Supreme Court shall have jurisdiction in equity in its discretion to dissolve such street railway

company, and the Attorney General shall institute proceedings for a proper disposition of its assets. The enactment of this bill would seriously affect the plans and policy of the New Haven company, which could not acquire additional trolley properties in the State, and probably would be compelled to surrender its present extensive trolley holdings at Springfield, in Berkshire County and elsewhere.

## France Investing Here

THE negotiation of a loan of \$50,000,000 in Paris by the Pennsylvania Railroad Company is an event of much financial importance. This is the first large issue of American securities that has been wholly placed in the French market. French bankers are cautious, and the French laws concerning the listing and sale of foreign securities are very strict. Evidently all the requirements of caution and law have been easily satisfied by the borrower in this case, and the way has been opened for further investment here of the funds of a people whose thrift is proverbial and whose investments in foreign securities are said to be \$500,000,000 a year. The Pennsylvania company was represented in the negotiations by its fiscal agents, Kuhn, Loeb & Co. The two great French banks principally interested are the Crédit Lyonnais and the Banque de Paris et des Pays Bas, but other banks and the Rothschilds were associated with them.

....The directors of the Baltimore & Ohio Railroad Company have increased the dividend on the company's common stock from 5 to 6 per cent. Ample warrant for this is found in an official statement showing, for the year ending with this month, an increase of \$9,500,000 in gross earnings and an increase of \$4,500,000 in net. The increase of dividend rate will enlarge the Pennsylvania's revenues.

....The Irving National Bank has declared an extra dividend of 1 per cent. in addition to the regular semi-annual dividend of 4 per cent. Samuel S. Conover was elected president six months ago, since which time the business of the bank has steadily grown.

**"Standard"**  
 PORCELAIN ENAMELED  
 Baths & One-Piece Lavatories.  
 Add the Last Touch of  
 Refinement to the Modern Home.

The charm of a dainty bedroom is greatly enhanced by the installation of a "Standard" Porcelain Enameled One-Piece Lavatory. Its gracefulness of design, its snowy lustrous whiteness, and its absolute freedom from crevices where dust and dirt can lodge, make it infinitely more sanitary and attractive than the old time washstand. With a bedroom so equipped the occupant is to a great degree independent of the bathroom. The cost is moderate—the comfort value enormous.

Our Book, "MODERN BATHROOMS," shows many beautiful Lavatory designs suitable for bedrooms with prices in detail. It also tells you how to plan, buy and arrange your bathroom, and illustrates many beautiful and inexpensive as well as luxurious rooms, showing the cost of each fixture in detail, together with many hints on decoration, tiling, etc. It is the most complete and beautiful booklet ever issued on the subject, and contains 100 pages. FREE for six cents postage, and the name of your plumber and architect (if selected).

The ABOVE "Anona" Lavatory, Plate P-520 can be purchased from any plumber at a cost approximating \$54.50—not counting freight, labor or piping.

**CAUTION:** Every piece of "Standard" Ware bears our "Standard" "Green and Gold" guarantee label, and has our trade-mark "Standard" cast on the outside. Unless the label and trade-mark are on the fixture it is not "Standard" Ware. Refuse substitutes—they are all inferior and will cost you more in the end.

Address Standard Sanitary Mfg. Co. Dept. M, Pittsburgh, U. S. A.

Offices and Showrooms in New York: "Standard" Building, 35-37 West 31st Street.

London, England, 22 Holborn Viaduct, E. C.

## PORCELAIN ENAMELED

### Baths & One-Piece Lavatories Make the Home Modern- & Assure its Health

Health, purity, cleanliness radiate throughout the house equipped with "Standard" Porcelain Enameled Ware. The snow-white purity of its enamel, the assurance of health from its smooth one-piece surface, the absence of cracks and crevices where dust and dirt might lodge, make "Standard" Ware the only equipment for a cleanly modern home, while the decorative charm which its presence lends, is not only a joy itself in use, but distinctly increases the value of your house, should you ever want to sell. "Standard" Ware is indestructible and the cost of its installation is moderate enough to appeal to the most economical.

Our Book, "MODERN BATHROOMS," tells you how to plan, buy and arrange your bathroom, and illustrates many beautiful and inexpensive as well as luxurious rooms, showing the cost of each fixture in detail, together with many hints on decoration, tiling, etc. It is the most complete and beautiful booklet ever issued on the subject, and contains 100 pages. FREE for six cents postage, and the name of your plumber and architect (if selected).

The ABOVE FIXTURES, No. "Standard" P. 28 can be purchased from any plumber at a cost approximating \$78.75—not counting freight, labor or piping—is described in detail among the others.

**CAUTION:** Every piece of "Standard" Ware bears our "Standard" "Green and Gold" guarantee label, and has our trade-mark "Standard" cast on the outside. Unless the label and trade-mark are on the fixture it is not "Standard" Ware. Refuse substitutes—they are all inferior and will cost you more in the end.
